The approach can be viewed as a series of actions patterned or organized based on certain principles (eg, basic philosophical, psychological principles, didactic principles, or ecological principles), which are systemic focus on the goals to be achieved. The approach contains a number of components or elements, namely: purpose, activity patterns, methods or techniques, sources used and principles (Sulistyorini, 2007: 13). The approach can be interpreted as a starting point or our view of the learning process.

Whereas the teacher centered approach lowers the learning strategy directly (direct instruction), or expository deductive learning. Meanwhile, learning approach student-centered learning strategies lowers discovery and inquiry and inductive learning strategies (Sanjaya, 2008: 127).

By viewingtheory put forward by experts, the approach is the starting point or view of organized or patterned to the learning process to achieve the learning objectives. Scientific approach was first introduced in America in the late 19th century, as the emphasis on the laboratory formalistic approach that leads to scientific facts (Hudson, 1996: 115).

The scientific approach allows teachers or curriculum developers to improve the learning process, namely by breaking the process down into steps or stages in detail which contains instructions for the students carry out learning activities (Maria Varelas and Michael Ford, 2008: 31). It is the basis of curriculum development in 2013 in Indonesia. The scientific approach is a learning process that is designed so that learners are actively building competencies attitudes, knowledge and skills through the stages observe, ask, gather information, reason, and communicate.

The scientific approach is believed to be the golden bridge and the development of attitudes, skills, and knowledge of learners. In the approach or work process that meets the scientific criteria, the scientists put forward pelararan inductive (inductive reasoning) rather than deductive reasoning (deductive reasoning). Deductive reasoning see a common phenomenon to then draw specific conclusions.

Conversely, look at the phenomenon of inductive reasoning or specific situation to then draw conclusions overall. Indeed, inductive reasoning put specific evidence in relation to the broader idea. The scientific method generally puts a unique phenomenon with specific studies and detail to then formulate general conclusions. Scientific method refers to the investigative techniques on one or several phenomena or symptoms, acquire new knowledge, or correcting and integrating previous knowledge.

To be called a scientific, the search method (method of inquiry) should be based on evidence of objects that can be observed, empirical and measurable with the principles of reasoning that is specific for the scientific method generally includes a series of activities of collecting data through observation or experiment, process information or data, analyze and formulate and test hypotheses. Scientific approach based learning is more effective results compared with traditional learning.

Research results prove that the traditional learning, retention of information of teachers by 10 percent after 15 minutes and the acquisition of contextual understanding by 25 percent. In a scientific approach based learning, information retention of teachers by more than 90 percent after two days and the acquisition of contextual understanding by 50-70 percent.

Characteristics of Scientific Approach

As for the characteristics of the scientific approach according Kemendikbud (2013) are as follows: 1) The substance or learning materials based on facts or phenomena that can be explained by the specific logic or reasoning; not limited to, approximately, fantasy, legend, or a mere fairy tale. 2) Explanation of the teacher, the response of learners and educational interaction teacher-learners free of prejudice necessarily, subjective thinking or reasoning that deviate from the flow of logical thinking. 3) To encourage and inspire students to think critically, analytically and precisely identify, understand, solve problems, and apply the lessons. 4) Encourage and inspire students to think hypothetically in seeing the differences, similarities, and link to one another of the learning materials. 5) Encourage and inspire students in understanding, applying, and develop rational thinking patterns and Bendatif in response to learning materials.6) Based on the concept, theory, and empirical facts that can be accounted for. 7) The learning objectives are formulated in a simple, clear, and attractive presentation systems.

The Steps Saintific Approach

Thats are 1) Questioning. Inquire as a process of finding out or confirm or match from prior knowledge of children with new knowledge that is being studied. Basically, the son of a reliable researcher, children are always curious about something that captured his senses. Therefore children often ask, which is sometimes very unexpected question adults. But the process of scientists coming from the critical mind. 2) Collecting. Collecting data is a process that is very interested in children. In this process the child to try - failed - please try again "trial and error". Children love to repeat the same activities but with a different way of playing. Learning who allow their children to do many things very supportive creative thinking abilities. While a lot of learning to use the work sheet instead shackle the creative abilities of children. 3) Associate. The association is a further process in which children begin to link the knowledge he already had with new knowledge acquired or in the surroundings. The associated processes important for children to develop a new understanding of the world around him. Piaget noted that children make up new schemata without discarding existing but previously improve and strengthen.4) Communicate. The process of communicating is the process of strengthening the knowledge to new knowledge on child get. Communicating is an activity to pass things that have been studied in various forms, for instance through stories, movement, and by showing the work in the form of images, shapes out of dough, dolls from papier-mache, crafts from recycled materials, and the results of webbing (Paudjateng: 2015).

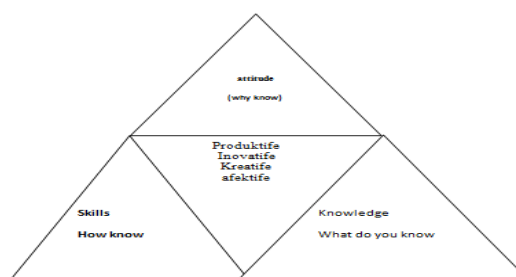
Learning Science Starters

Ability to learn to benefit the development of human civilization either individually or in groups. Individual children's learning abilities can be delivered on the personal development that leads to the formation of the pattern of individual skills, life skills, and mastery of certain skills.

Piaget's theory (Daryanto, 2014: 53) states that the study relating to the formation and development of sekema (distance schemata). Scheme is a mental structure or cognitive structure in which someone intellectually adapt and coordinate the surrounding environment (Baldwin, 1967)

.Next Vygotsky in his theory states that learning occurs when learners work or learning to handle tasks that have not learned yet that task they are within range of abilities or tasks that are within the zone of proximal development area is located between the level of child development is currently defined as problem solving skills under the guidance of adults or peers who are more capable.

Learning the scientific method has had the following characteristics: a) Centered on children; b) Involve science process skills in constructing the concept, law or principle. c) Involves the cognitive processes of potential in stimulating the development of the intellect, especially the child's thinking skills. d) Can develop a child's character.

The following chart will be presented learning outcomes childbearing productive, creative, innovative, and affective through the strengthening of attitudes, skills and knowledge are integrated.


Picture 1 (Nugraha, 2008)

Learning Outcomesproduce of Children Productive, Creative, Innovative, And Through Strengthening Affective Attitude, Skills and Knowledge Integrated

It is recognized that learning is a combination of structured covers elements of human, material, facilities, equipment and procedures that affect each other achieve the learning objectives. In this case the man involved in the learning system, namely, children, teachers and other personnel. Furthermore, materials such as whiteboards, markers, books and so forth. The facilities and supplies consist of classrooms audia visual equipment. Procedures such as practice, study schedules and methods of information delivery. Learning must be marked by the organization of various interrelated components. Early childhood learning is a process of interaction between children and teachers and other adults in this case the parents in a development environment to achieve the task. Conceptually early childhood learning is learning through play where play activities

are part of the learning process it is motivated by the conditions characteristic of early childhood are actively exploring the lingkungannnya.

According to Isjoni (2009: 56) Learning directed to the development and refinement of the potential capabilities such as language skills, socio emotional, motor and intellectual. From the description of teachers should design the learning so that children are not burdened in achieving development tasks.

A scientific attitude with regard to children's ability to think critically is a cornerstone in conducting scientific investigations so as to produce a product of science as facts, concepts, principles, theories and laws, Amin (1987) describes the relationship between the ability to investigate, process, and products of science and scientific attitude. The scope of the development program of science learning in children in terms of the development or capability that must be achieved so that there are three dimensions that must be developed which include, capabilities associated with the mastery of science products, process mastery of science and master of science attitudes (life scientists).
Picture 2. Scope of science program learning (Nugraha, 2008:94)

From picture 2 can be explained that the division of the scope of the development program of science learning can be meaningful if all development programs that are integrated science learning should be able to draw on a wide range of field development planning into one unified and synergistic. The task of further teacher development program for the benefit of science learning is selecting the things that can be incorporated more specifically associated with the development of science program for children. General expectation is with the development of science learning have an understanding and experience of learning science intact, meaningful and functional for life.

The way children learn science

The children aged 4-6 years are part of early childhood, which is a sensitive period for children in which experts refer to as the golden age, at this time the intellectual development of children has increased to 50% that occurred maturation and psychological functions of children who are ready to respond to stimulation provided by the environment. According to (Isjoni 2009: 19) This period is due to lay the first foundation in developing physical abilities, cognitive, language, art, social, emotional, self-discipline, religious values, self-concept and self reliance.

Child is a unique individual many theories experts both psychologists, educational specialists, and other experts who study child development, especially early childhood, -temuan findings of the latest research results that are closely related to the profile and characteristics of children has been widely presented and believes that the behavior and the realization of children are very influenced by the environment can not be separated from it, the teacher as the person who demanded his role in a child menagani advisable to know very basic things related to the development of children both generally and specifically. Understanding of the development and characteristics of children adequately will be able to optimize the activities carried out which activities are controlled optimally and conducive to learning. Instead of learning situations that are not based on developmental characteristics of children the situation is not clear. From these explanations can be simply illustrated by the following Scheme (Nugraha, 2008: 47).

In general Mustafa 2002 (Nugraha, 2008: 50) identified a number of characteristics of early childhood as follows: a) Using all senses to explore objects; learning through motor activities and social participation; b) Still short attention span; bored easily and may look away when there is a new response. c) Started to develop the basics of language skills, playing with sounds; learn basic vocabulary with concepts; began studying implicit rules that regulate its expression. d) The rapid development of language. e) Active attention to everything but with a short attention span. f) Put themselves as the center of his own world; interest behavior and his thoughts were focused on themselves (egosentric); g) Inquisitive about the world of his own as a

child; h) Became interested in the mechanism of how things work and the outside world around him.

The review of early childhood provides early childhood information that can not be ignored, they have a number of potential that can be developed. Related to the development of science, information about the characteristics and development as described will be used as a foundation to facilitate and mengobptimalkan starters science learning in children.

The dimensions of the changes that occur in early childhood after participating in science learning, (Nugraha, 2008: 57) is as follows; 1) Personality, namely by having the response pattern or a new behavior. Example: originally a child likes to lie and impatient, but after following appropriate science lessons, now it becomes less of a lie habit and start diligent in working and learning. 2) The behavior of actual or potential, namely the ability to perform activities that are not real or apparent (usually internal behavior). Example: before the children can not distinguish between crabs and spiders, but after a science lesson he can explain the difference between the two animals were adequately. 3) Skill. Skills in acting, ie kemampun associated with the use of motor (coarse and fine). Example: before the children can not enter kelubang thread the needle, but with continuous practice eventually he can do well. 4) Attitudes and habits, ie the application of the values of life in everyday behavior. Example: before children are not familiar with their own washing dishes after a meal, but because the environment at home do so, then he studied, and eventually he became commonplace and familiar. 5) Knowledge and understanding, in the form of mastery of the concepts, principles and theories. Example: Before the child can not properly explain the concept elephant but after a visit to the zoo and he watched carefully, he was finally able to explain adequately.

METHOD

The purpose of this study was to describe the scientific approach to learning science starters, performed in group B TK Beringin District of Gorontalo city Dungingi totaling 20 children. This research type describe clearly in detail, obtain accurate data of the focus of research by using qualitative approach, method naturalistic study for research performed under conditions of

natural (natural setting) where the researcher is as a key instrument to collect data that is more detailed and can dipertanggung justified.

Data is in this research was obtained through observation of the observation guide to see the scientific learning process in children in group B, to improve the validity of the study using photographs. Interview guidelines are guidelines that form the basis for making inquiries to the informant to obtain data on learning scientific activities include observing, ask, collect infirmasi, reason and communicate, obtained directly from informants who were in school, such as Principal, Teachers, Children and references other to support this research.

FINDINGS AND DISCUSSION

Based on data from Description Approach Scientific in Learning Science Starters result of research based on observations have been obtained that there are 17 children who are already well developed in indicators of communicating, the indicator observes that has developed very well amount to 15 children, the indicators gather information that has developed numbered 14 children , the propose activities that has developed a very good indicator amounted to 13 children and reasoning are developed very well amount to 12 child.

This is consistent with the data that is assessed by means of observation checklists with information undeveloped, began to grow, develop according to expectations and growing very well. Where children are grown on the activity observed, ask, gather information, associate and communicate during the process of learning takes place inside and outside the classroom. In accordance with the results of observations conducted guidelines, children who are in Beringin kindergarten District of Gorontalo city Dungingi on scientific learning has been growing. There are five indicators in the observation that:

Observing

Observingis performed to determine such things with senses such as seeing, hearing, breathing, feeling and touching. From the results of research conducted through the results of the first semester (odd) on the scientific study shows that some children have not developed the indicators observed by the number of 10 children of a

number of 20 children. This is because most of the children are still less focus on the object / objects being observed by the child, frequent delays of children coming to school and is still a lack of resources in the form of a real child observation.

After the application of the scientific approach to the learning process in the second half (even) has suggested that the B1 group on scientific learning activities already developed very well with a number of 15 children, developing according to expectations amounted to 2 children. So that the result of observing indicators of child well-developed amounted to 17 children from 20 children. This shows a good result, because in the learning activities of scientific indicators to observe that in the second semester, more children are given the opportunity for teachers to play an active role in learning activities scientifically as children can observe the object / objects to be studied, can feel the difference in taste, distinguish between smooth and rough texture and can perform some simple science experiments such as experimental objects floating, floating and sinking.

Ask

In the scientific approach to learning is a child ask the parties. the question that arises is expected associated with the objects that have been observed by the child. Kids are encouraged to ask questions, either about the objects that have been observed as well as other things he wants to know. From the results of research conducted there are three children who have not developed the indicators ask that they needed guidance and direction from teachers. Teachers can also ask stimulating activities for children in advance using the methods of conversing on the subject being taught is so that children can understand more clearly the theme taught and children can do activities ask if there are things that are poorly understood by children. The result of the above discussion is supported by the theory that asking questionsis one measure to determine the level of understanding of the child after learning (Usman, 2010: 96).

Gathering Information

Gathering information is an activity undertaken by a variety of ways, for example: to do, to try, to discuss and summarize the results from various sources. Learning to use a scientific approach will involve the children in an activity to investigate the phenomenon in an attempt to obtain the correct information. From the results of research conducted on learning activities with a scientific approach to gathering information specifically indicators already developed very well with a number of 14 children, growing as expected with the amount of 3 children, began developing and underdeveloped 0 amounted to 3 children. In order to get the results of indicators to gather information for a child that has developed on indicators collected information amounts to 17 children from 20 children, the teacher gives kesempaan to children to try their own experiments made or mimicked, infer what children see and discuss with teachers and with peers about what children know.

The result of the above discussion is supported by the theory that the repeated observations of the several objects and events with interpretationcommunicate, the child looks very pleased with the media given by the teacher, the child is very excited to create a work according to his desire. Teachers provide opportunities for children to be creative in accordance with the imagination, but still refers to the themes that are taught, in the event a child is very active role so that all aspects of the existing development in children is clearly visible.

Reasoning

Reasoning is the ability to link the information already owned with the new information obtained so as to get a better understanding about something. From research conducted obtained results of research on learning scientific in children in group B on the learning activities of scientific, especially indicators of reasoning has been developing very well with the number of 12 children, growing as expected with the amount of 3 children, began to grow with the number 2 children and underdeveloped totaling 3 child. So that the results obtained from the indicators make sense for children who thrive on making sense of the indicator amounted to 17 children from 20 children.

Comunicatting

Communicating is an activity to pass things that have been studied in various forms, for instance through stories, movement, and by showing the results of his work in the form of images of various shapes from dough, dolls from papier-mache, crafts

from recycled materials and the results of webbing. The results were obtained data on the activities of communicating, the child looks very pleased with the media given by the teacher, the child is very excited to create a work according to his desire. Teachers provide opportunities for children to be creative in accordance with the imagination, but still refers to the themes that are taught, in the event a child is very active role so that all aspects of the existing development in children is clearly visible.

CONCLUSION

Based on the results found in this study can be summarized as follows: 1) From the data on observation shows that children are able to perform learning science by using scientific learning approaches such as the activity observed, ask, gather information, reason and communicate the child is already well developed in accordance with the child's age and developmental level of the child's learning needs. 2) Using a scientific approach to learning science starters very influential on children's knowledge, the value of spiritual / religious character of the child and the child to think scientifically and critically.

In closing this research report some suggestions need to be presented are as follows: a) The scientific approach to teaching science in the beginning, teachers should use teaching media in the form of objects / objects are concrete or in the form of pictures related to the theme being taught.

b) Teachers need to motivate to conduct learning activities in particular on the activities of communicating produced in the form of a work so as to produce works that "innovative" and can provide a whole array of tools / materials used by children and the need for assistance in learning activities science starters with the application of scientific learning approach so that children are able to think scientifically.

THE STRATEGY IN EMPOWERING
THE INSTITUTION CHARACTER BY HEADMASTER
AS AN EDUCATIONAL LEADER

Juharyanto

State University of Malang, Indonesia

Email: juharyanto.fip@um.ac.id

ABSTRACT

The development of education and schooling from time to time not only been on the aspect of their institutions, but also on the role and core of the content carried out and taught, in accordance with the direction of government policy and global trends. The empowering the character had been becoming an issue the government to be realized. Each learner must be integrated the character values for their nowadays and future era. As a change agent, the principal strategic positions must guarantee to make it happen. The school principal is the key figure and strategically having strong position to strengthen the character. Therefore, it is important to principals to know various strategies to strengthen the students' character, especially in accordance with the global trends and development.

Keywords: characters institutes, principals, educational leaders

Leadership is an activity in organizing the physical resources to achieve organizational objectives effectively and efficiently (Gordon, 1991). In particular, school leadership is a behavior that depict human relationships in performing the tasks of school organization, even the leadership is seen to have close links with the personality. Leaders as part of an organization with a strong vision.

Leadership will run effectively and efficiently if there is consistency between the values of leadership are believed to conduct the implementation of (Robbins, 1999; Owens, 1991). Comprehensive study conducted at Ohio State University suggests the dimensions of the smoking behavior of leaders initiating structure and consideration (Robbins, 1999). Initiating structure describe the relationship managers and subordinates. While consideration is the behavior of brotherhood, confidence, warmth, interest and respect. Both of these dimensions give birth LBDQ (Leader Behavior Description Questionnaire) which indicates that these two dimensions are separate but not contradictory factors that lie in the continuum line four quadrants. Another study by The University of Michigan also put the behavior of leaders associated with the benchmark performance effectiveness (Robbins, 1999), which found the two forms of leadership behavior, which is production oriented leadership and employee-centered leadership, which by Likert is classified into three types of leadership behavior, namely: 1) task-oriented behavior, 2) relations oriented behavior and 3) participative leadership. According to the study, generalize effective leadership behaviors include effective leaders tend to: 1) establish a relationship with a subordinate who support and uphold respect for, 2) using the methods of the group in the supervision and decisions, 3) develop criteria high.

Various research leadership in context and different cultures in the decades to conclude that the values of honesty, integrity, solidarity towards the truth, and deep involvement emotionally and personally on all the organization's personnel is seen as the main determinant for the success of the practice of the leadership of an organization (Brown and Townsend 1997; Kouzez and Posner, 1991; McEwen and Salters, 1997; Sale, 1997; Swann, 1998). Desire for the authentic presentation of the values of integrity and truth appreciate the variety of contexts and cultures by the overall organizational resources is the fact and must be fought and revealed (Bhindi and Duignan, 1997; Duignan, 1998; Juharyanto, 2012). Authentication of these values trigger inflammatory spiritual motivation organizational and significantly impact on the birth of human empowerment organization that strengthens mutual achievement of organizational goals and was perfect (Covey, 1992).

From some research on educational leadership at the school, it was found that "lust" accomplished solely through strong leadership awareness is pushed firmly into the individual all stakeholders of education inspired by the example of "lust" outstanding principals in the form of a tangle of meaningful interaction through the use of value- value-based leadership with a variety of cultural contexts adjustment consistently (Juharyanto, 2012). Leaders are not just aware that they were with him, but farther and in that they are human dynamic that has ideals beautiful in the future and needed a place and an opportunity to develop optimally for the purpose of the

organization as a learning community they (Duignan, 1998; Fullan 1995; Keefe and Howard, 1997; Sackney, 1998; Sergiovanni, 1996; Juharyanto, 2012; Juharyanto, 2014). Therefore, effective leadership will only happen if the ethics and values of leadership was fundamental to the leader in carrying out its leadership (Brown and Townsend, 1997).

The concept of leadership ultimately must be interpreted in the context of a broader, more meaningful and more relevant to the real life of the community and trends. (Juharyanto, 2012). Finally, it should be realized that not only focuses on the leadership ability to influence others, but rather the power to stimulate awareness of others through the exploration of self-awareness of strengths together to achieve organizational goals. Leadership is basically a process of education and indoctrination humanist values of personal character in the context of the organization in the current global developments that surrounded him. Leadership in charge of exploring and developing the strength of character of the whole system of intersubjective approach based organization with global trends.

CONTEXT
Trend of Global Education Overview and Trend Global Education Practice

Globalization is a form of realization of the ultimate goal of integration of the various aspects of multi-region must be addressed wisely and appropriately by education. There are at least four things that will be the focus of globalization, among others, the first, multi-region countries into a unified production of multi-regional territories. Meanings wise to various global characteristics become an important part in the decision process of reflection determining educational organizations.

Second, globalization impact on competition is high, requiring a policy that includes competition policy, consumer protection, Intellectual Property Rights (IPR), taxation, and E-Commerce as well as integrative and comprehensive, views of leadership. Third, globalization has become the region's economic development as the basic reference in the size of human welfare. Competitiveness and dynamism of economic business will be enhanced by facilitating the development of human resources in terms of capacity building, finance, and technology. Fourth, globalization will be fully integrated on the entire sector, including the education sector.

Based on the four focus globalization, the gap between countries in the region are becoming increasingly small, certainly if it is supported by a balanced human resource capability. Although in some respects Indonesia also benefited from the production of goods that are not owned by the state of other areas, but if the quality of Indonesian human resources is not made significant progress, it is not impossible, Indonesia, with the largest population that is attached to mental consumptive, shocked, instant, and so only the main target countries in the region that have quality human resources (production) level. The primary key in the face of this is improving the competence of Indonesian human resources in order to utilize the comparative advantage into competitive advantage, with efforts to increase competitiveness of national human resources (Siradjuddin, 2014) and global.

The practice of education in a globalized world dominated by global product devices are getting stronger. Education does not only proceed in the traditional form, but more will be (were) takes place without limits of space and time. Education global era will undergo metamorphosis into education "without classrooms" (classroom-less) and without paper (paper-less) based e-paper, in which the central beliefs of learners and the community will be shifted to the product data and information technology based software, compared to the educators (Juharyanto, 2014).

The response to the presence of the globalization trend is certainly to be supported by reliable human resource capacity, strong mastery of science, foreign languages and technology, and a commitment to strong leadership and the ability to make itself as a model (uswah) powerful agents of change. Efforts to improve the quality of human resources can be reached with the efforts of synergy between government, business, and academia to establish competency standards of professionalism in each sector. Acceleration improving the quality of human resources to compete in the face of global 2015 must be implemented in order to achieve progress and catch up with other countries. The response to the global trend of course is not only a personal effort of everyone in the organization.

Strengthening local characteristics should be based on potential personal organizational agreement. However, the existence of an educational institution, whether consciously or not be the main backbone is expected by society to be able to prepare their students to become citizens of the generation of reliable global era with a stick to local characteristics. Educational institutions must make an effort respite before suspending its citizens. Naturally, the leading figure in carrying out these efforts are in themselves the principal.

Building Character Education Institutions

Character education includes moral dimension reasoning, moral feeling, and moral behavior (Lickona: 1991), or in the sense of the whole as a morality that includes moral judgment and moral behavior both prohibition-oriented morality and pro-social morality (Piaget, 1967; Kohlberg; 1975; Eisenberg-Berg; 1981). Character education should be developed by applying a holistic approach, with the understanding that "Effective character education is not adding a program or set of programs. Rather it is a transformation of the culture and life of the school "(Berkowitz: ... in goodcharacter.com: 2010). Lickona (1992) states that: "In character education, it's clear we want our children are Able to judge what is right, care deeply about what is right, and then do what they believe to be right-event in the face of pressure form temptation from without and within.

System fundamental values of an organization that is efficient are the values that built and strengthened through the form of value-based leadership strong and actually practiced by leaders with a shape model, thus binding the whole system organization into a homogeneity of characters that reinforce the organization itself , The value system is "conceptions of life in the mind as citizens on matters that should they deem is valuable in life" (Koentjaraningrat, 1982: 2), while the behavior is a "function of people's interactions with the environment" (Owens, 1991: 178). The products of interaction that could take the form of good behavior that brings a sense of security, satisfaction and others and bad behavior that can bring a sense of fear, hatred and others. In the organization, according to the theory could be "office holders" (Owens, 1991: 69), "employees and customers" (Robbins, 2002: 17), and both interact with their environment.

In this case the leader of the organization can start by creating a vision that would be credible by the members, communicate that vision all of the citizens of the organization and then institutionalize this vision through a variety of behaviors, rituals, ceremonies, and symbols, as well as through the system and the organization's policies (Vishnu and Nurhasanah, 2005: 263). Values-based leaders of character will gain the trust and respect of all members of the organization when leaders are able to concretely demonstrate their passion, persistence, struggle and sacrifice in carrying values of organizational character. Strengthen character education institutions significantly strengthening the values of characters (good and right) into the leader's personal self itself. The

success of self-affirmation would affect the character modeling the response by all the resources in the school system itself.

Every human being must have a positive character in the form of a positive attitude in view of the general public. A positive attitude, among others, optimism, faith, attitudes quickly recovered, sportsmanship, enthusiasm, sensitivity, humor, gratitude, humility and hope. Those virtues undergoing a process of internalization and dissemination into the individual and social relations in the organization.

Allport (in Suryabrata, 1984: 148) does not distinguish between the character (character) personality (personality). Both are dynamic organizations in the individual as a system that determines psychophysics unique way of adjusting to the environment. Character is used in a normative sense. In the original language, Allport calls "character is evaluated personality", otherwise "personality is character devaluated". According to Allport man is an organism that at the time of the birth in childhood are biological beings, then changed / developed in adulthood into individual ego is always evolving.

Denison (2000: 42) states that culture can affect the performance of the organization, organizational culture model is based on the properties of cultures of involvement, consistency, adaptability and mission. Wijanarko (2006: 63) states the values and norms to control the behavior of members of the organization, so that the culture of the organization will form a certain pattern of behavior of its members. Thus, the character played by principals as educational leaders to be very important and very powerful in determining and developing the organization's culture.

Principal as Amplifier Models Character Institution

The principal is a professional officer in the school organization responsible for managing all organizational resources and cooperate with teachers in educating students to achieve educational goals and to understand all the needs of the school. Professionalism principals can be achieved when they fulfill certain requirements and criteria that have been applied in the Minister of National Education (Permendiknas) No. 13 of 2007. Hanson (1991) states that the principal is able to perform its functions based on the duties and responsibilities, then a school principal should have the competence, which later became one of the basic references issuance of policies on certification of educators (Bafadal, 2008).

There are five competencies required of the principal in accordance with Permendiknas (Minister of National Education Regulation) No. 13 in 2007, namely: personal competence, managerial,

entrepreneurial, and social supervision, although implementation is often hampered for several reasons. Such as low mental principals, lack of motivation and spirit as well as the lack of discipline in doing the task, and often arrive late, insight principals are still cramped, even ambiguity implementation of the realm of the political on the basis of vested interests it often obscures the role of the principal professionals to improve the quality of quality teachers and quality of education nationally (Eferakaya in Ololube, 2007), because of the school's existence cannot be separated from political terminology (Cherian, F. & Daniel, Y., 2008). Within the framework of this, the socialization of organizational culture (Wasis D. Dwiyono, 2008, and Raihani, 2007) needs to be done in the context of the consistency of the spirit of decentralization (Tony Bush and David Gamage, 2001) in order to make the process of change in schools become more qualified and able to strengthen values character to the entire academic community of schools, particularly students.

The school principal as a leader not only teaching, but also as a change agent (agent of change) and the facilitator of the real work in the school reform (Wohlsetter, 1996). Bafadal (1995) found that the success of the process of implementing changes in primary schools supported by internal agents, especially the principal.

Research related to the theme of change in primary schools has been carried out following the findings that should be used as reference for developers and practitioners, including Lezotte, et al (1983) who studied the effect of the characteristics of effective schools on learning achievement; Purnell & Gotts (1983), which examines the involvement of parents in guiding children at home; Goodlad (1975) who studied the success of the school; Frymeir, et al (1984) who studied a hundred schools either through changes; Gibbons (1986) with a research emphasis on effective schools research through the implementation of the School Improvement Program; Barozzo (1987) which examined the effectiveness of schools by emphasizing the special teaching program; Rutter (in Sergiovanni, 1987), which examines the key role of principals for improving the quality of student output; Davis (1989), which examined the effectiveness of schools and teachers effective; and others. Various studies indicate the importance of the organization of the school as an integral part to accommodate the creation of a good school (read: effective, quality), which organizationally is largely determined by the principal.

Of diverse opinions above is known that the principal is the key to a crucial change in the direction in which the school is desired. The principal is the first and main responsible for the success of the character strengthening resource educational institutions. Failure and success are strengthening entirely the responsibility of the principal, as the industry leader and agent of change in schools. In short, modeling principals visualized into the attitudes and behavior characteristic in daily attendance, the key factor for the success and failure of educational institutions assisted.

Institutions Character Education Strengthening Strategy

The principal is a professional officer in the school organization responsible for managing all organizational resources and cooperate with teachers to reinforce character values to students through education and teaching in schools. The school principal is a teacher plus his post as principal for its expertise in aspects of knowledge, attitudes, and skills. Overall these aspects blend into oneself fully and proportionally to become a different person when compared with the presence of teachers and other administrators. Thus, strengthening the character to the whole resource, the task is not difficult for principals with the stock-provision the perfect aspect of competence. In fact, not all principals are able to do strengthening the character. School principals are often trapped in the dominance of administrative and technical activities, where they basically are also required to carry out such other functions as leaders, managers, and supervisors at his school. A good understanding of these functions need to be internalized and improved as a guarantee of strengthening the character of students, as mandated by law. In addition, some of the strategies that can be done to strengthen the value of the principal characters to the learners, among others: 1) integration of the whole institution; 2) Integration of total competence into everyday aspects of school culture; 3) Strengthening the commitment of discipline; 4) cooperation with third parties; 5) On going monitoring and evaluation; 6) Routine Reporting Progress; 7) Open reflection (Juharyanto, 2015).

The main priority in strengthening the character is through the planting of educational values that strives to maturing whole man. Suwarno, (1985) stated that in order to pass these education efforts, the school cannot do it alone without the involvement of other parties, namely the family and society. That awareness has consequences on schools to constantly coordinate intensively on strengthening the character of the students as part of the family and the community, receiving feedback, and plan the same precautions

in treating learners. Involving the community and family resulted in increased public awareness of school programs, as well as platforms for third parties to find a solution to all the problems associated with the weakening of the character he wants, and to strengthen it together.

One aspect that is emphasized in the process of internalization of values-based character in the process of character development of students is the value of professionalism and competency awareness of himself as principal. Moving the students to always apply the character values should be done through the example, where the principal realizing values of competence in real life every day. Moving the learner's meaningful presents stimulus good values through the embodiment of these values in the presence of everyone, especially the students. Integration of the values of these characters can also be done through visualization of the character values that are integrated with educational aids openly spread into every aspect / infrastructure education unit.

Strengthening of the character is closely linked to the strengthening of discipline commitments. Commitment discipline should be built on the basis of individual potential learners. By implication, the performance indicators of discipline among different individuals, as different disciplinary action they will receive. Rules within the framework of the enforcement of discipline to build character prepared by schools, so that uniform, is an indication not accommodated aspects of individuality learners.

Awareness of the importance of the involvement of the institution and the amplifier amplifies the value of the character in character values learners should be nurtured and strengthened to all school resources. Implementation of cooperation with various institutions also seem to deserve more serious attention from the principal. Particularly firmness roles and definitions of coordination between them, ranging from forms of coordination, monitoring and evaluation systems, as well as the clarity of character building and values of integrative of the internalization of the desired characters. Activities comparative study, paramedics overnight, internships, bring in speakers, outbound activities, and others are some examples of third-party cooperation. Empowerment school committee as an organization that has the ability to observe legal in character of the people, it becomes very important to do. The characters are developed would remain based on the loyalty of the

people, in which the school committee have the knowledge and experience about it.

Strengthening monitoring and evaluation of the characters refers to the principle going on monitoring and evaluation. The activity was carried out with a view to be able to reflect on all forms or performance reinforcement characters performed by students and the entire school resources. The activity is not limited by time and place, long lasting time and in all conditions. Each resource has a relatively equal role in conducting these activities.

A progress report achievement strengthening character should become routine and planned perfectly. Routine activities often are not ignorant of the substance of the activity itself. As a result, activities for the sake of activity is only done in order to abort the scheduled obligations. Therefore, these activities should be planned in such a way that the substance of his progress report to produce constructive conclusions for the improvement program to strengthen the three characters together among existing education centers. Every effort to strengthen the character should be reflected openly by all the parties involved. Reflection is done through Bergama approach, either one-way reflection, two-way reflection, reflection and multi ways, depending upon the scope, resources, and performance targets learner's characters.

Besides, according to Bezzina (1995), there are several strategies that were developed in the context of decentralization and institutional transparency, among other things: 1) Develop a vision; 2) Main Ideology; 3) Meeting the Challenge; 4) learners; 5) imagination; 6) promoting values; 7) empowerment; 8) collegial leadership; and 9) heroic.

Research conducted by Buell, 1988; Champy, 1995; Fullan, 1995; Terry, in 1993, concluded that the effectiveness of a change is determined by the development vision properly distributed to the entire organization. This condition requires wisdom and faith institutions to cooperate more on helping institutions under it shape their future through the formulation and development of their own vision, of course, the vision that in-breakdown of the vision and mission of the institution on it.

The main ideology is defined as an organization's character, whose existence becomes adhesive for each institution to develop and move forward together to realize the vision in one bond of harmony normative regulative. The main ideological cover basic values, core purpose, and envision the future.

The basic values are very important and enduring presence for an organization that is in the process of learning. The basic values are rooted in the values legalistic recognized as true by mass (perineal). The values of honesty, trust, integrity, working monkey, efforts to repair themselves

endlessly, empowerment and creativity, services, and mindset, attitudes, actions holistic, should not change because of the changes that occur on the outside, but rather be the best reference for the occurrence changes in organizational systems (Collins and Porras, 1996). The core objective is more emphasis on the reasons why the organization was held, created or formed. The core objective which can effectively help members reflect ideally motivation in achieving organizational goals.

Envisioning the future is to set goals and a clear strategy to achieve the goal in the future. Fritz (1996) states that the development of an organization is determined by the clarity and firmness of purpose the mission statement of the organization. For organizations that are always learning, the mission will not be meaningless if the mission does not possess an inner self-educator, patterned on the attitudes and actions, then drift off to all corners of the organization (inner edge) is extrapolated into the formulation of objectives more concrete and realistic. Thus, the strategy also includes the formulation of indicators or success criteria as the basis for clarification of the terms of the dimension of time, effort, cost and the activity itself (Ainscow et al., 1996).

The failure of educational practices in the context of the decentralization of education by promoting independence and autonomy over the management and leadership is not entirely successful. The cause is an act done in preparing the resource leaning on a technical level conceptual aspects that require change, and less attention to the human aspect characters (Bezzina, 1998). Effective management for an organization, it cannot be taught, because the management is not just a collection of mechanical task, but the character interaction humanistic (Bell and Harrison, 1998), and an emphasis on the aspect of character humanistic have an effect on the future leadership of the effective (Adair, 1983 ; Mortimore and Mortimore, 1991), and integrated with humanistic character, which according to Duignan (1998) is the leader of the "full-blooded creatures who are politically and spiritually aware, Earthly and practical. The principle of lifelong learning should be upheld and practiced by the leader (Crowther and Limerick, 1998). Leaders need to promote an environment in which active learning can occur. Learning needs to be seen as a social activity (Downs, 1995) in which everyone has a role to play in helping people to learn.

Visionary leaders always make "mental leap" by changing "conditions are not possible at this time" to "should be in the future". They are always bound by the imagination so that the commitment and high creativity, childbirth new energy and a new way of life-sustaining organization. An important characteristic of future leaders constantly strives to be a model / example and communicate his example through the depth of beliefs and ideas as well as his daily behavior, or according to Boyatzis (2010) is called the resonant leader. The leader of the global era into a creator of value system once the center echoes those values which then reverberate around the entire corner of the organization according to certain principles are recognized reliability or Covey (1992) called a value system centered around Principles. Leaders would do well to seek to attach behavior management and leadership to the principles of personal integrity, credibility and trusting relationship (Kouzez and Posner, 1991), and a commitment to ethical values and morals such as compassion, humility and service (Juharyanto, 2014) so that the organizational structure, processes and practices to be built, maintained, preserved and developed. Of course the value of the promotion will run well when framed by the principles of al *Muhafadatu 'a laa Qodimis Sholeh wal Akhdu bil jadidil Ashlah* (in Juharyanto, 2012). Subordinate sometimes admire leaders who delegate their authority, which makes subordinates feel strong and capable. Underling handed back the trust, support and praise to the leader, and this helps to strengthen the leadership and vision of the organization. Leadership cannot be the prerogative of one person. Future leaders need to be trained to master the art of shaping the team, in collaboration with the team rather than directing and giving orders. Collegial leadership encourages prolonged resistance organization.

Management basically have a heroic dimension because it is always in touch with the challenges and the pursuit of success and there is no reason to run away from responsibility (Teal, 1996). Leaders are confident and always willing to challenge himself to do a lot of things that probably seemed beyond her abilities and at the same time always willing to accept the challenge of internal and external organization.

CONCLUSION

From the foregoing description it can be concluded among other things:

1. Globalization was inevitable and unavoidable, as the impacts inherent with it. To the school as a leader educational institution is obliged to make himself as a model for strengthening the competence and global character-based local values.

2. Human Resources quality produced only by quality education run leader who also qualified.

3. Strengthening characters into educational institutions can be done through various strategies, among others: 1) integration of the whole institution; 2) Integration of total competence into everyday aspects of school culture; 3) Strengthening the commitment of discipline; 4) cooperation with third parties; 5) On going monitoring and evaluation; 6) Routine Reporting Progress; 7) Open reflection; 8) building a culture of independence; 9) develop a vision; 10) confirms the main ideology; 11) establish the readiness to face challenges: the learners, the imagination, the promotion of values, empowerment, collegial leadership and heroic spirit. ✍

VALIDATION OF THE PSYCHOLOGICAL RESILIENCE SCALE AND IMPLICATION FOR GUIDANCE AND COUNSELING PRACTICE

Kadek Suranata; Adi Atmoko; Nur Hidayah

Study Program Guidance and Counseling, Pascarasajana State University of Malang

Email: sura@konselor.org

ABSTRACT

This study validated of a Indonesian adaptation of the psychological scale of the resilience youth development module (RYDM) for secondary school version. This scale measure six psychological factors hypotheticthat associated with student's academic success. Sample of 158 seventh grade students from five secondary schools at Singaraja, Bali (47.4% male and 52.6% female, with age range 12-13 years). The construct validation using exploratory factor analysis (EFA) method, with SPSS 22.0. Five iteration of the EFA produced 14 items of 18 items tested, which make up 5 a factor of 6 original factor in the scale. This five factors formed (of 14 items)are remains consistent with the conceptual basis RYDM in the original instruments used. Implications of the results for the practice of guidance and counseling in schools is discussed.

Keywords: resilience scale, validation

A core goal of school counseloris to provide flexible and responsive services for adolescents who are experiencing mental health challenges that MIGHT inhibit transitions to upward-spiraling, positive developmental trajectories (Masten, 2001). One component of this overall effort is to search for and monitor psychosocial experiences via the administration of whole-school surveys as part of universal mental health screening assessments (Dowdy et al., 2015; Moore et al., 2015).

Every student has the possibility to dealing with various difficulties, obstacles and psychological pressure (stress) in academic activities as well as their development tasks. The students in secondary school, they were faced with the complex of academic and developmental tasks that cannot be completed by students easily. Students often failure to solve this problems, and then trigger the emotional stress such as high anxiety, social problems and other issues.

Children and youth develop into mature adults depending on the extent of intrinsic assets such as perseverance, efficacy, self-esteem, and active avoidance of risk-taking behaviours, and extrinsic assets such as living in a nurturing environment with supportive parents, having a non delinquent peer group and experiencing a healthy school climate (Armstrong et al., 2005; Lerner et al., 2003). When faced with adversity and risk, some youth will survive and even thrive, while the others will succumb to risky and possibly self-destructive behavior.

Measurement of resilience is needed to identification of modifiable factors that can be used to inform research and policy to help youth capabilities thatis required to cope adversity during normative and non-normative developmental transitions.Resilience is a set of capabilities that students use to successfully come to terms with his failure, emotional social overcoming difficulties that can lead academic activities with high academic achievement results. Resilience is a psychological construct the which includes several capabilities that contribute positively to students' academic achievement and healthy development.

Resilience is defined as a positive adaptation ability to succeed in the face of pressure risk. The proposed model of resilience Benard (1995) suggested that the characteristics of students who have resiliency characterized by (1) the ability to obtain a positive response from others, thus forming positive relationships with teachers and peers; (2) the ability to solve problems related to planning and decision-making on an issue that accommodate the views and self-control as well as strategies to get help from others; (3) autonomous concerning the identity and the ability to act independently and control the environment, and (4) positive aspirations and goals that include its realistic goals, expectations of a healthy, persistence, and a view towards a bright future.

The Healthy Kids Survey (HKS) is a comprehensive, student self-report tool for monitoring the school environment and student health risks (Hanson & Kim, 2007). The CHKS is a school-focused questionnaire that measures risk and resilience factors through student self-reports. It has been used in research examining factors Influence of smoking and drinking behaviors (Kim & McCarthy, 2006), teenage pregnancy (McDonnell et al., 2007), asthma Among Hispanic and Asian

students (Davis et al., 2006), and risk factors associated with school violence (Furlong, et al., 2001). One component of the CHKS is the Resilience Youth Development Module (RYDM)(Constantine & Benard, 2001; Constantine et al., 1999; WestEd, 2009).

The full RYDM contains 56 items that were designed to measure the internal assets (personal strengths) and external resources (protective factors), all of them have been linked to positive developmental outcomes (Benard & Slade, 2009). There is an elementary and secondary version, however, the focus of this article is on the secondary version for internal assets subscales. This study analysis the internal assets original 18 items were developed to measure six-core constructs based on Benard's resilience model (Benard & Slade, 2009). As the RYDM has been used in California and additional analyzes completed, clarifications to its underlying structure and content have been reported. In a detailed analysis, Hanson and Kim (2007) found that the number of items could be reduced due to differential item functioning (across racial-ethnic groups or by gender), inconsistent factor loading patterns, or cross-loading items across factors. Therefore, this study uses the 12 internal asset items identified by Hanson and Kim (2007) that measure four areas of personal strength: self-efficacy, empathy, problem solving, and self-awareness.

Previous research conducted Hanson & Kim (2007) have provided evidence supporting the psychometric properties of the instrument RYDM and showed that at the school level sub-scale psychological or internal assets is positively related to index of ranking's academic performance (Hanson & Austin, 2002). However, given that this RYDM developed as a population-based surveys, there is limited evidence supporting the use and interpretation of the youth students in Indonesia, into account individual differences (cultural, racial, demographic, and so on).

Therefore, the purpose of this investigation is to adapt the psychological scale version RYDM secondary school into Indonesian. This study uses 18 original items from RYDM psychological subscale that measures the ability of cooperation and communication, self-efficacy, empathy, self-awareness, problem solving and goal aspirations (Constantine & Benard, 2001; Constantine et al., 1999).

METHOD

Translation process of Psychological Resilience Youth Sub-scales Depelovement

Module (RYDM) from English to Indonesian involving linguists from UPT Language Ganesha Education University, Singaraja. Administrating scale was done through a survey using respondent amounted to 158 of 7th grade students from five secondary schools at Singaraja. From the 158 respondents, 47.4% male and 52.6% female, with age range 12-13 years. Charging is done by the respondent resilience scale by selecting one of four alternative answers are provided for each items, (1) not at all true, (2) a little true, (3) pretty much true, (4) very much true. Construct validity of methods using exploratory factor analysis (EFA), the which is done use SPSS 22.0.

RESULTS AND DISCUSION
Results

The first iterationof EFA (18 items, n = 158) showed the Kaiser-Meyer-Olkin (KMO) is 0.638 and the Barlett's test were significant (p <0.001), indicating that the sample size are adequated. Anti-image Matrices value in item 7 is 0.484 (p> 0.5), so thus item 7 is deleted. The second iterationEFA (17 items, n = 158) showed a value of 0.655 KMO and Barlett's test values were significantly (p <0.001). Anti-image Matrices in all items (17 items) showsignificant values (p> 0.5). Extraction communalities of item 8 is 0.432, less than the required extraction (> 0.5), thus itemdeleted from the analysis.

Analysis of the third iteration(26 items, n = 158) show KMO is 0.658 and significantBarlett's test (p<0.001), Anti-image value of items 4 amounted to 0.493 (<0.5) thus deleted from testing. Analysis of fourth iteration (15 items) KMO value 0.691 and indicates the significant value of Barlett's test. Anti-image output Matrices on all items show anti image value significantly (p> 0.5). However, the value extraction communalities item 1 of 0.477 less than the required extraction (> 0.5), thus deleted from the analysis.

Fiveth iteration EFA (14 items) showed the KMO value 0.688 and significan Barlett's test (p <0.001). Anti image value on all items (14 items) is above 0.5, (p>0.5). Matrices Anti-image as well as the value extraction communalities show anti image value at 14 items was tested is above 0.5 (> 0.5). Thus the factor analysis of five iteration, using 14 items have met the test requirement exploratory factor analysis.

The next step is an assessment of the factors that are formed are summarized in the table 1.

Interpretation of the items forming the five factors in table 1 are based onsignificant loading factor. Loading factor under 0.40 is not written and the items are sorted by loading each item in each factor. Factor 1, 2, 3 and 4 has three items with significant loading and a factor 5 has two items. Each factor is given a labeled name of factor based

on the items that form. Factor 1 is formed by items 10, 11 and 12, are based on factors originated from factor problem solving then it remains to be named as problem solving. Factor 2 was formed by items 13, 14 and 15 is labeled as self-awareness factor. Factor 3 is formed by items 2 and 3 (derived from the factor of cooperation and communication) and item 9 (derived from factors empathy), to reflect two of the determining factors are then given a new name as a social skills. Factor 4 is formed by items 16,17 and 18 were named factors goal and aspirations. Factor 5 was formed by items 5 and 6 remain named as a factor of self-efficacy.

Validation of factors is an important step in the factor analysis, especially when trying to determine the underlying structure between variables. Optimally, the measure used is a factor validation analysis via confirmatory factor analysis, such as structural equation models, but the type of follow-up is often not feasible. Another way, which can be used in the validation effort is a factor with a separate sample analysis or conduct the analysis with new sample (Hair et al., 2010). In this study, the way used to test the stability factor is formed by way of a split sample analysis.

The first step in the validation process of these factors is splited the sample into two equal samples of 158 respondents, the estimation models to examine the appeal factor. Table 2 shows the loading factor on varimax rotation for two-factor model, as well as extract value communalities. As can be seen, the two rotation varimax quite comparable in terms of loading and communalities for all items.

Based on the results of table 2, it can be seen that all items forming factors identified in earlier testing stable adequacy of forming a common factor in this analysis in the first and second iteration. The results of the analysis of item-total correlation on each item (n = 158) showed Cronbach's Alpha value more than 0.777. With this result, can reasonably believed that the factors which form is stabled at these samples and fit for use in wider population.

Discussion

Table 2 show summarizes the means, standard deviations, and t-values of each factor and the overall sample by gender. This test involves a sample of 158 respondents comprising 75 Male (47.4%) and 83 Female (52.6%). The comparative factors in the sub-scale psychological resilience by gender shows that there are significant differences between respondents of women and men in self-awareness factor with t value of -3.043 ($p < 0.05$) and the factor of self-efficacy with t -

1.068 ($p < 0.05$). While on other factors, namely problem solving, social skills and goals and aspirations as well as the overall resilience is not a significant difference.

Construcs validation results version of junior high school students have produced 14 items of 18 items tested, which make up 5 a factor of 6 original factor in RYDM. The results of exploratory factor analysis (EFA) in round five showed that 5 factors formed of 14 items used remains consistent with the conceptual foundation applies. These results are in line with the testing that has been done before by Hanson and Kim (2007), which shows RYDM psychological subscale version of junior high school students who produced four factors psychological resilience and consistent with the original instruments used and referenced conceptual foundation.

Analysis of all five rounds factors show that factor 1, 2, 3 and 4 are formed by each of the three items with a factor loading of each significant, meanwhile, a factor of 5 is formed by two items. The results of this analysis in fact does not detract from the six factors used in RYDM origin are used. But there is a merger of two factors into one factor, namely the factor of cooperation and communication and empathy factor merge into one factor labeled social skills.

Related with the conceptual underpinnings of resilience models proposed Bernard (1991; 1995; 2004) that cooperation and communication aspect is part of social skills which is defined as the ability to work, exchange ideas, and express feelings and establish effectively relationship with others. Cooperation and communication skills is one of the potential that encourages students to be able to locate and utilize sources of help from others in the face of academic difficulties. Meanwhile, empathy is also an important part of social skills (Bernard, 1991; 1995; 2004), which is a skill that directs a person to behave with compassion and give priority to the feelings of the others. Empathy is also about understanding and caring attitude with the experience and the feelings of others (Hanson & Kim, 2007). The description indicates that the skills of cooperation or communicate very closely related to empathy, even a single integral part. Skills in cooperation and communication without being accompanied by empathy can not achieve the result of cooperation and good communication. Because, basically, everybody feels comfortable to interact, cooperate or communicate with people who understand and appreciate the feelings and thoughts.

Stability testing of five factors (comprise 14 items) resulting from the analysis of five rounds to use methods *split sample analysis.*The analysis showed that the 14 items forming five factors identified in earlier testing stable adequacy of each

fixed form factor similar to the analysis in the first and second rounds. Meanwhile, item-total correlation analysis on the each items (n = 158) showed Cronbach's Alpha value more than 0.777. With this result can reasonably believed that the factors which form stable at these samples and fit for use in the wider population.

Comparative analysis of the factors in the sub-scale psychological resilience by gender shows that there are significant differences between respondents of women and men in self-awareness factor with t value of -3.043 (p <0.05) and self-efficacy factor with a value of t -1.068 (p <0.05). While on other factors, namely problem solving, social skills and goals and aspirations as well as the resilience of the overall no significant differences between the samples of men with women.

Research limitations

Although this study has successfully demonstrated the validation RYDM psychological subscale to Indonesian secondary school version, the sample is limited only involves students in grade 7. To get a more varied response, future studies require involving a sample of students in grade 7-9 with involving the school population more lots and in the wider region. In addition, this study is limited to only a test of the psychological subscales (internal resilience assets), future research should also perform testing involves sub-scale for external assets.

Implications for Guidance and Counselling Pratice

Guidance and counseling is one component of the formal educational system in Indonesia. School counselors as a personnel executive for developing the psychological aspects that support the academic achievement and healthy development (Permendikbud No. 111 of 2014). In signs Implementation Guidance and Counseling in Schools (ABKIN 2007) also mentioned that the guidance and counseling in school settings have primary urgency to help the various capablities of each student in overcoming various difficulties or problems, realizing mental health, and success in academic, career and social. This description indicates that the school counselor as key actors in guidance and counseling services in schools must have a strategic role in developing academic resilience as a realization of optimal development of students. One of the efforts is to organize of counseling's programthat addressed to help students overcome psychological stress, helping students develop the ability to solve problems, improve the readiness of emotional

and social competence as well as providing positive support needed for students when faced with difficulties, failures, problems in the academic and life.

Based on understanding of the factors that shape and influence the development of the resilience acording theory by Bernard & Slades (2009) and Grotberg (1999; 2012), counselorshave been developed the program that adressed to: optimizing the quality factors of individual (internal assets resilience) and revitalize external factors of a social environment that supports the development of the assets of a student's resilience (Winders, 2014; Nicoll, 2014). Correspondingly, Masten et al., (2008) also suggested the school counselors, teachers, principals and staff roles administration to colaborate as a promotive and protective factors in the lives of students to developing learning skills, a wide range of competencies, skills self-management, and other skills in carrying adapt to their social environment.

School counselors can contribute to the resilience of the students in a variety of academic guidance and counseling program that's independence, as well as efforts to promote a positive relationship between teachers and students, between students and the staff, and to all students. The efforts of advocacy or interventions aimed at protecting students from the negative influence of risk factors. School counselors can promote programs involving teachers, principals, administrative staff and all the students as collaborative partners in creating a climate conducive school environment ss well as a partnership or collaboration with the parents to create a climate conducive care at home.

Measurement of the psychological aspects of the resilience of students is one of the efforts for school counselors to understand the potential of strength the students. This is important because the practice of counseling and psychology in the school setting today are challenged to look at students as individuals who have the potential, assets, or strengths and sources of potenial from the environment (Seligman, 1999; Gallasi & Akos 2007; Akos & Gallasi 2008; Gallasi et al., 2008). This is also consistent with the Comprehensive and Developmental Guidance and Counseling paradims (ASCA, 2012).

Measurements of resilience can enable it to do identification of influencing factors, and can be used as information research and policy ideas to help students develop the capacity they need to overcome the difficulties during their developmental stages. Through the identification of resilience student, school counselor or school psychologist can design and conduct educational programs that are relevant socio-emotional resilience based on the condition of students.Based

on the above, it can be argued that resilience is an aspect of a potential or strength of students is important to be understood by a school counselor or school psychologist. Understanding the condition of the resilience of students associated with the resilience measurement efforts that require a measuring instrument. Results validation of RYDM psychological subscale is beneficial for school counselors as part of the instruments used in an effort to understand the psychological aspects that depeloving student resilience.

THE HISTORY OF TURKEY IN THE NOVEL OF API TAUHID WRITTEN BY HABIBURRAHMAN EL SHIRAZY

Khaerunnisa; Mutiarani; Iswan

Universitas Muhammadiyah Jakarta

Email: pbsi.fipumj@gmail.com

ABSTRACT

This study, entitled "The History of Turkey in the Novel of Api Tauhid written by Habiburrahman El Shirazy." The main problem is about the history of Turkey that has a unique position on the history of the world, especially in Europe and also the Muslim community which is portrayed in the whole story. The purpose of the research is, (a) to describe the elements of structure of the novel as well as the entanglement among the elements in the novel, (b) to find, understand, and to describe the historical proof of Turkey. This research uses qualitative method that has descriptive type, and also the sociology of literature is used as the approach while the conclusion technique uses inductive menthod. The conclusion of the research are; the first is the novel structure of Api Tauhid has traditional rule as the correlated, organized and coherent structure whether on plot, character, setting, and theme. Furthermore, it shows the entanglement of the story of the great Bediuzzaman Said Nursi combined with romantic love story between Fahmi and Nuzula. The second, knowing the touch of natural beauty of Indonesia, local culture of Indonesia met with Turkish's nature and culture depicted in the novel.

Keywords: turkish history, sociology of literature, and bediuzzaman said nursi

The novel as a work of fiction can contain values of society struggles. In the historical novel, historical values conveyed through stories created by authors drawn from the events of the past that really happened. According Nurgiyantoro (2013: 8) history suggests only events that never happened, bound and limited to the facts, though not infrequently there is also a manipulation of history. History is the most important thing to be learned by all of humanity as it is said in (QS.Yusuf: 111);

> "Indeed in their stories that there is a lesson for people who have sense. Al-Quran is not a made-up story, but justify (the books) were previously able to explain everything, and as guidance and mercy for those who believe. "

History can be obtained from various sources, one of them through a literary work. Novel in the science literature is a form of prose. One of the novel that contains the value of their history is Api Tauhid written by Habiburrahman El Shirazy. Novel of Api Tauhid by Habiburrahman El Shirazy tried to take the unusual setting, take the Medina and Turkey as a background where a story is told.

The historical value of the novel Api Tauhid can be understood carefully and there are interesting things, especially on the background of history that can give the impression and makes the readers imagine and recall the history of the Ottoman Empire and Turkey recognize leaders in the era of upheaval, Bediuzzaman Said Nursi. Therefore, researchers interested in studying the history of Turkey in Api Tauhid written by Habiburrahman El Shirazy.

Based on the background of the problems above, the focus of the problem in this research is the history of Turkey in Novel Api Tauhid written by Habiburrahman El Shirazy.

The Definition of Sociology of Literature

Sociology of literature is one branch of science to study literature. Endraswara (2008: 79) emphasizes the sociology of literature is research focused on human problems because literature often expresses the struggle of mankind in determining its future, imagination, feeling, and intuition. Furthermore Swingewood in Yasa (2012: 24) sociology of literature is aimed to connect the experience of the characters and author's situations imaginary with their historical climate. Based on some of these opinions can be concluded that the sociology of literature is literature research linking social aspect in a work of literature.

The Concept of Historical Values

History is an important part of the journey of a people, nation, state, or individual. According Sjamsuddin (2012: 9)

term history of the Arabic word syajaratun which means "tree" that is similar understanding with salasilah (salsilah, genealogy), which means "family tree" (family tree; stamboom) later adopted into a history that eventually are used in general that the same meaning to the term history as a result of a scientific study in English or in French histoire, Geschiedenis in Dutch, or Geschichte in German. Based on the opinion, the philosophical history depicts a family tree that has a close relationship between the roots, trunk, branches, twigs and leaves and fruit. All the elements of the tree are has very close relation.

According Poerwadarminta in Dien Madjid and Johan Wahyudhi (2014: 8) on the progress, the history of the Indonesian word refers to the word history (English). The word history, means (1) genealogy; origin; (2) events, events that actually have occurred in the past; (3) science, knowledge, stories, lessons about the incident and the events that actually occurred in the past; history. Based on the ideas, history has a strong linkage between the events of the past. On the other words, the history here is a science that expands the development of society with a long poses once so that will be formed into an object of history.

According Daliman (2012: 5) understanding of history can refer to three terms, first, history as an event that actually happened (res Gestae), second, history as a story or knowledge of events that have occurred (rerun gestarum or full acta or scientia rerum gestarum), and third, the history as the value (value). Based on the opinion, that history can be divided into: history as an event, the history of science and history as a value.

Based on some of these opinions can be concluded that a history of incidents or events in the past related to human life, which has a close relationship between the past, present and future.

FINDINGS AND DISCUSSION

No	Unit	Quotation from the Novel	Turkey Historical Proof	Analysis
1	5	And that day, before the sun is directly overhead, the Muslims have been flying the flag of victory. That afternoon, Sultan Mohammed II entered Constantinople City accompanied by all the troops and their commanders. Sultan Muhammad II passes through the Gate Andrianopolis now known as Edirnekapi. (p.100)	Al-Munyawi (2012: 152) on that day, Tuesday 20 Jumadal Ula 857 AH / May 29, 1453 AD, before the sun is overhead, Sultan Al-Fatih has been at the center of the town accompanied by troops and their commanders while saying "Mashallah God! "He turned to them and said:" You really have become the conqueror of Constantinople who had reportedly by Rasulullah sallallaahu alaihi wa sallam. " Amiruddin (2013: 25) Sultan Mehmet II until given the title of Al-Fateh (Conqueror), being able to conquer Constantinople, a fortress that is very strong in the European world. Some of the previous king wanted to conquer Constantinople, but only when the Al-Fatih Mehmet can mnembus blockade the citadel. Following the war conquered Constantinople history illustrates, courage, tenacity, and intelligence of the king who is also a military leader.	The victory of Muslim people gained in conquering Constantinople is the effect of the great zeal, fueled by the story of the history of the past, where a fire spirit was transmitted by the Rasullah sallallaahu alaihi wa Sallam.
2	5	Since then, Sultan Muhammad II got the nickname Sultan	Amiruddin (2013: 18) empire of the Ottoman Empire led by Sultan Mehmet II's famous name to Al-Fatih,	History as the value is able to write every success. The success achieved in power

		Muhammad Al Fatih. At that time, he was only twenty-one years, and has led one of the most famous conquest in the history of mankind.(p.101)	thus its name to Al-Fatih Mehmet. Sultan is then able to defeat the Byzantines and conquered Constantinople in 1453 AD with the opening of Constantinople as the strongest bastion of the Byzantine empire then open wider road towards Europe. Al-Fatih title precisely because he is able to conquer the city of Constantinople who never could be done by a number of previous sultans. Edyar, et al (2009: 143) he was known by the name of al-Fatih the Conqueror or appetizer. Because in his time the Byzantine city of Constantinople as the capital can be conquered. Mubarok (2008: 205-206) highlight the expansion carried out by Muhammad II (pngganti Murad II) so that the title of al-Fatih (Conqueror). Mohammed II conquered Constantinople (1453 AD) and was renamed Istanbul. Nurhakim (2012: 147-148), in particular the expansion forwarding is done by the Caliph Muhammad II Al-Fatih burglar, because of its success to conquer the last bastion of the Byzantine empire, Constantinople.	will give you "immortal" Civilization. Power will always follow the success of any value.
3	9	There he read and studied the books of the day and night. The books of reference of the scholars are quite heavy as Jam'u al Jawami 'he finished with the brief.(p. 181)	Syauqi (vol.6: 764) and when Said Nursi are under the guidance of Sheikh Fathullah Afandi, he intensively within one week being able to read and memorize the book of Jam'ul Jawami'karya Ibn as-Subki. Tampubolon (vol.11: 3) Nursi classified pupil of genius. At the level of the madrassa, Nursi have been able to learn and memorize the learning material in the field of religious sciences, among them such as: hermeneutics, the science of hadith, fiqh, tasawwuf, and others. He was able to memorize and master more than eighty major reference book of Islam, they are: Book Jam'u al-Jawami ', the book Sharh al-Mawaqif, Tuhfah, and others.	History proves every civilization always breeds amazing people who have great strength.
4	10	No doubt, Sheikh Molla Fethullah amazed by what he saw. "Subhan allah, the incredible intelligence with extraordinary	Syauqi (vol.6: 766) and at this moment, as a result of his achievements, and the intelligence he has, Said Nursi widely known as Badi 'al-Zaman time or miracle, the name given to him a few years earlier by Molla Fethullah of Siirt.	Epithets will always be inherent for awesome strenght. This is the story of history that can't be underestimated or forgotten in the blink of an eye.

		memorization strength in you. This is really extremely rare. You deserve to be called Bediuzzaman. The wonders of the age. "It was the first time gained the nickname Bediuzzaman Said Nursi. Furthermore, the nickname that will be attached to his name, so often called Bediuzzaman Said Nursi. (pp.200-201)	Tampubolon (vol.2: 3) thanks to the achievements and reputation in the field of religious sciences and non-religious sciences, as well as his skill in debate with a number of leading scholars, but when it was new age around 16, Nursi was given the nickname "Badi'uzzaman "(child of the times and superhuman today, excellence times). Amiruddin (2013: 44) after graduating as an Islamic scholar Said Nursi study on Sheikh Fethullah Efendi, and for his wit in learning he was called Bediuzzaman (the wonders of the age).	
5	20	On October 29, 1923, the Supreme Council adopted a constitution that created the Republic of Turkey. On the same day, Mustafa Kemal was elected its first president. And on March 3, 1924, the Grand National Assembly, passed legislation removing the contents of the Caliphate, and severs all relations between the Republic of Turkey and the Ottoman Caliphate. (p.417)	Amiruddin (2013: 41) Republic of Turkey was proclaimed in Ankara on October 29, 1923. Statement of reimbursement form the State of forms kingdom to a republic at the same time shift the relationship between religion and the State. State Affairs have been split with religion even religious practice has been banned in the public domain. Since the imposition of Islamic law in the State Turkey also removed and then exchanged with secular law. All aspects of education are taken over from the religious men and then placed under the control of States which have adhered to the secular system. Similarly, institution or organization Shaykh al-Islam removed on March 3, 1924, and then on to replace directorate in charge of religious functions. Mubarok (2008: 217) as caliph was considered insubordination for having political activities, such as receiving guests from other countries, to send ambassadors to foreign countries, and held a ceremonial pomp on Friday, and remained in Istanbul, MNA decided that the post of caliph removed because they gave birth to dualism leadership (March 3, 1924) and the caliph Abdul Majid and his family sought asylum in Switzerland.	History is a picture of the human past and the surrounding areas as social beings. No lasting from every grip power. Power becomes setback if the man doesn't grip tightly. Leadership changes sometimes do not always bring a positive direction. Instead toward a very sad setbacks.
6	20	Since then, the New Said was born whole life was devoted to taking the essence of the Qur'an with the mind, heart, soul and body. From there was	Tampubolon (vol.2: 5) to the phase of the New Said, he struggled to "reach the essence of reality" and the answers obtained from the Quran. In his view, the doctrine of monotheism is the only clue to escape from the influence of philosophy and science	As a creature that has a thought, certainly not just remain silent without making changes in themselves. This is evidenced by the New Said that his life just devoted to

		born his monumental work Treatise Nur. Soul of the Qur'an is the seed, nursery and garden for the growing development of the Minutes of Nur. (p.423)	which he did not give me any answers on fundamental issues, such as war, death, and mortality. Because, according to the philosophy and moderns science just flopped to the materialistic world. Since that time, he felt the change in him, as well as its world outlook (worldview) of reality. Since then, along with the incessant threat from outsiders to Islam at the turn of the 20th century, Nursi decided to focus its attention on the Quran. In fact, all the knowledge he had learned to "measures to understand the Qur'an". Amin (vol.5: 34) works of Nursi was born of reflection and spirit of the Qur'an, which he maknai appropriate context of its time. Indirectly some of his work is a resistance and social criticism against the tyranny and authoritarian secular regime of Kemal Ataturk under Republicans. For twenty-five years in prison exile (1925-1950), did not dampen Nursi in to write a masterpiece that is currently collected in the collection of the nine-volume treatise Nur. There are several more that have not the collected volumes for certain considerations. Muaz and Faizuri (vol.7: 138) Rasail an-Nur Said Nursi is a college tarbiyyah fully based on Qur'an that touched on faith. Therefore Raisal an-Nur, known as "Kulliyatul Rasail al-Nur '. The main sources are the Qur'an and Hadith. He was composed and written by Said Nursi and sometimes written by his students. It is also then covered with tannic originally by himself	the Al-Quran.

CONCLUSION

Based on the research that has been done on the novel Api Tauhid written by Habiburrahman El Shirazy towards Turkish historical proof, it can be concluded that these more novel tells Turkey that is growing, both in academic circles and the general public. This happens especially when Turkey began to show amazing growth trend that can be said to represent two civilizations, East and West. The struggle of Turkish history Islamic period (Ottoman) and the modern era (secular) clearly illustrated through narration in this novel.

NEUROCOUNSELING THROUGH EEG ELECTRO ENCHEPALO GRAPHY: THE BRAIN WAVES DESCRIPTION ON THE STUDENT WITH THE PHOBIA BEHAVIOR

Khilman Rofi Azmi

State University of Malang, Indonesia

e-mail: rofiazmi@live.com

ABSTRACT

Today counselors are striving to make sure that their counseling process is scientific based. A new Counseling paradigm that related to neuroscience, called Neurocounseling, is acknowledge by American Counseling Association (ACA) and became a new branch of Counseling in 2015. This study is used Neurocounseling paradigm to overcome phobia phenomenon that is suffered by students in Malang and Tulungagung city, East java Indonesia. Preliminary study showed us that 46 students from 80 students had showed phobia symptom. It means that 50% students are suffering learning disorder with various levels. We designed our research to record students with phobia symptom's brainwaves through Electroencephalography (EEG). The record of counselee brainwave will make counselors achieve a better result of counseling because it will help them to choose the right counseling technique. We used qualitative approach and case study to find out student with phobia symptom's brainwave and mental condition. We used some data collecting techniques: interview, observation, and documentation. The finding showed us that the main brain wave of counselee with phobia symptom is Beta wave in frequency 20-30Hz, it means counselee has high level of anxiety. Counselee also had a deep tension on nerves and muscles during brainwaves record in counseling process.

Keywords: neurocounseling, phobia, brainwaves

Globalization has come and changes most of aspects, moreover knowledge and technologies. The development of psycology and counseling is an indicator of the dynamic society and human being. Counselor is one of profession that may face big challenges and problems in every change that happenned in education sector. It makes counselor have to be professional and have good competencies as a school helper.

The main issue that is faced by the counselor is school requires a good performance and high competencies, moreover in counseling services. As we know that some people arugue about counseling process is questionable, is it empirical or not? Then some people are prefer to choose other helper such as psycologist and psychiatry. This issue was idetified by Vogel and Wester (2007:5), according to their research, the main obstacle of counseling process is the hesitation of counselee and another school stakeholders.

Supriadi (1990:10) found that 38%-60% of parents were not satisfied by counseling sevices in school. And according to Murad (2011:15) stated that the level of satisfaction counselor performance only reached maximum on 70 %. Counseling and services have a significant role in answering numerous problems that is experienced by students .This was triggered by several missconception that counselor was only giving advice and counselor

did not understand the theory and techniques of counseling. Stelzer (2003: 20) stated that counselor has low competencies , lack of appropriate program, and counseling service is delivered ineffectively. In the 21st century , counselor as one of professional helper are demanded to show that they have to give an effective service, moreover counselor (Matthew , 2013: 25). If they can not show the best performance, the assumption of counselor is not as professional as another helper (psychologist and psychiatrist) would make them inferior and lack of confidence, as in the statement bellow.

> *For how long do we as counselors have to feel inferior to the psychologist and psychiatrist? Let's just do what we do well. I encourage other professions to chase that straw man because, in the end, that's just not the philoshophy of counseling* (Matthew, 2013: 45).

If we examine based on quotations above, the reason why counselor felt inferior compare to another helper is the authentication of counseling services. Counseling services has to change counselee better instead of make counselee doubtful to their problems . There are some research show us taht counseling theory and technique give students better solution, but it will be only a thousand pages of research report when we do not evaluate and increase counselor competencies immediately.

According to Chapin (2015: 30) counselor with a core of applied science or applied science

should begin to show a more scientific paradigms and counseling can be proven empirically. Mc Henry (2013: 35) argue that the counselor is necessary to know the internal conditions (the brain and mind) counselee. The better the condition of the brain counselee counselors know the more effective interventions that can be provided.

One paradigm that is used to support empirically changes in the counseling process is the science of the brain (neuroscience) and counseling. The development of a scientific assessment of neuroscience into one of the challenges that must be in the "attach" to the complexity of other scientific disciplines, including counseling. Griffin et.al (2012: 45) says that the integration of brain science with other disciplines or Neuro-Enhancement become one of the stronger predictors in the list of 12 scholarship that will thrive in the 21st century.

Statement of Griffin has also been justified by the Pledge (2016: 72) states that the development of science that has grown rapidly determined by the human brain. If before 2000 scholarly study of neuroscience-oriented only abnormalities, disorders and diseases of the brain, but in the following years is to focus on the study of the relationship between the brain with other disciplines such as technology, economics, education, language, community, psychology and counseling. For example, the paradigm approach which combines education with neuroscience terkaji in the work Mariale Hardiman (2012: 10) emphatically termed the term and concept of neuroeducation. While the study of psychology in the light of neuroscience known as neuropsychology (Millan, 2014: 60) that describes the position as a neuropsychological study of science as well as psychological phenomenon from the viewpoint of the brain.

Research conducted by Chapin (2015: 39) in a period of nearly 10 years have shown that counseling can change the brain. Counseling can create new pathways for neural circuits of the brain and changes in brain circuitry will affect the behavior of the counselee.

Through neurocounseling paradigm, counselors are required to be able to provide treatment in a more holistic and integral. Chapin (2014: 30) says "Counselors have known for years that counseling changes thoughts, behaviors and the brain, and now we have scientific evidence". In America, in 2009, the National Accreditation Board for setting up counseling programs related to education or the Council for Accreditation of Counseling and Related Educational Programs (CACREP) has

started to draw up a program for the training of counselors who are concerned in the field neurocounseling (CACREP, 2009: 53) , The latest standards issued by CACREP in 2016 also explicitly including scholarly study of the brain (neuroscience) in the curriculum counseling (counseling curricculum) on a section (section) to 5 ie Identity Professional Counselor (CACREP, 2016: 65).

The focus of this research is try to uncover the neurocounseling paradigm through brain wave analysis conducted on the counselee in pre counseling. Counselee who suffer from phobias will be recorded via EEG brain waves with the intervention of the object that is the source phobia with the aim of ensuring the assessment counselor before starting counseling.

METHODS

This study used descriptive-qualitative approach and study case to gain data from counselee with phobia symtomp. Depth interview, observation, and documentation are used as data collecting method. Triangulation is used as data validation and also checked the data to all of the participant s or members that are involved as informants. Here is the table of informant.

Informant

Counselor
Neurologist
Nurse
Counselee parents
Teachers

Table 1. Research Informant

RESULTS

The results showed that the counselee who suffer from a phobia showed normal brain waves with the diagnosis. However, experience muscle tension that affects heart rate, and breathing faster when the intervention, the researchers showed the source of phobia with a certain distance. The results also showed that the EEG brain wave is the most prominent Bheta wave with a frequency of 20-30 Hz. Chapin (2015: 85) categorizes brain waves with a frequency of 20-30 Hz as a wave Bheta high level (High Level Bheta) which means that such waves meruapakn brain waves that appear when a person with anxiety (anxiety) is very high.

Through these results are expected counselor will be able to empirically diagnose the problems being experienced by the counselor. The use of EEG beginning of the counseling process can be asesment strong results and empirical as a first step to follow up on stage counselor counseling (working stage).

Figure 1:Counselee Diagnose Result

Figure 2: Counselee Brainwave when Phobia Attacked.
DISCUSSION
Phobia Phenomenon

One neurocounseling application is through the use of EEG (electroenchepalography) used to determine brain waves before, during and after the counseling process. Neurocounseling implementation in the context of the present study is related to the phenomenon of acute anxiety and fear or phobia. The phenomenon phobia is a strong emotion and is associated with few signs of worry or anxiety were divided into three categories namely motor reaction, the reaction kogntif and psychological reactions (Marks, 1969: 80).

Preliminary studies conducted by researchers found that of the 80 students, 46 or

more than 50% of them reported having a phobia. Researchers distributing questionnaires adapted from Wolpe (1973: 283) with 86 kinds of phobia of different categories. Some types of phobia experienced by students at SMAN 1 Kedungwaru include a phobia of heights (Acrophobia), vitriol and gall (Agoraphobia), darkness (Nycophobia), loneliness (Menophobia), went into the water (Claustrophobia), germ (Microphobia), pets (Zoophobia) and certain objects are like balloons (Hellenologophobia).

Based on the level of phobia is so varied, the researchers chose one of the students who are experiencing phobia with a high enough level that the score of 9 to 10. Another consideration is the strong desire of the subject to get immediate treatment and recover from phobia experienced. Type of phobia is experienced acute anxiety of the balloon (Hellenologophobia). The reaction occurs when the saw the balloon is cold sweat, screaming and crying. The reaction appeared to be a constant and permanent. The subject of research (counselee) 16-year old female realize the phobia that happened since the age of 10 years and in the two figures are clearly visible picture viewed from a phobia suffered brain waves that appear.

Previous Research has Linked Neurocounseling

Neurocounseling is a branch of science that recently passed by the ACA (American Counseling Association) since 2015. Yet the science development is very rapid. Some research studies related case neurocounseling among others One application neurocounseling on previous research conducted by Chapin (2015: 105). Counselee experience anxiety and avoidance or avoidance due to the trauma of parental divorce. It also affects the hours of sleep problems. The counselee has been counseling for a few sessions, but the outcome has not been maximized. Though each meeting / counseling session has ended and counselee as optimistic for a change in him. Chapin then try using Neurofeedback therapy by examining the entire brain counselee through EEG (elektroensephalography).

EEG is a tool to know the brain waves that appear and captured by a specific electrode. The result of five channels in the EEG finding their dysregulation in the occipital lobe meaningful high anxiety still found in the brains of the counselee. Evaluation then carried back and counseling sessions undertaken by the counselee. After several sessions of counseling, counselee then undergo significant changes and to ensure it will decrease in anxiety and other disorders later carried through EEG records brain waves back.

The other study was conducted by Ted Chapin (2015: 77) found one counselees "suzy" impaired learning because of their anxiety and

dependence on sleeping pills have been doing counseling on a regular basis, and yet obtain significant results. The counselor then started using EEG and Neurofeedback to provide a holistic therapy, and as a result, the session to 12, then came to a disturbance in the prefrontal korteksnya. The next step is continued counseling session with a behavioral approach to control the progress of counseling through neurofeedback and recording brain activity. As a result, the counselee has experienced a very good progress in the session 16. The counselor can be more accountable for its performance through the results of the assessment and diagnosis are more empirical and scientific based.

Other studies have produced findings that the use neurocounseling paradigm through brain scans MRI (Magnetic Resonance Imaging) into neurocounseling empirical evidence that can be used to detect the effectiveness of cognitive approaches to reduce stress, depression, anxiety or anxiety. As for disruptions abnormalities, neurocounseling become one of the empirical evidence against ADHD, Asperger's Syndrome to Scizofrenia.

Minimum standards
■ At least 8 channels simultaneously
■ At least 17 electrode recording
■ Monopolar and bipolar
■ Procedures
■ Opened and closed eyes
■ Engineering calibrated at the beginning and at the end of the tape
■ In naman listed recordings and the patient's age and date of recording
■ Long recording a 15-20 minute (120 pages)
■ Status / state of the patient should be recorded on the tape (unconscious, drowsy, movements, coma, and so on).

The Meaning of EEG and Brain Waves

History electroencephalogram (EEG) was started in 1929 when one of the scientists announced the possibility to record a weak electric current is generated in the brain, without opening the skull, and the results are illustrated in the paper. Then the new recording format is known as electroencephalogram (EEG). So it can be seen that the EEG is a tool that records electrical activity in the brain and then interpreted according to Lunders (in Benson, 2000: 80).

Suspicion Seizure	Growth and Development Disorder	Change Behaviour	Mental Disorder
Epilepsy	- Speech delay - Motoric delay	- Awareness sudden decline, confusion	Learning disorder, hyperactivity, attention deficit disorder, phobias

Table 1.1 Individuals Need To Do EEG. Source: Lunders (in Benson, 2000: 40).

There are several criteria for individuals who need to be given treatment using EEG brain scan. Below is Table 1.1, which describes the individual criteria that need to be done EEG.

Furthermore, there are some minimum standards that must be met EEG recording, the following are their points.

Tabel 1.2 Minimum Standar of EEG Scanning Source : Lunders (Benson, 2000: 45).

Based on the results of recording brain waves in Figure 2, note that the counselee shows the dynamics of brain waves that vary widely. it is particularly visible in Bheta wave which is in the range 20-30 Hz. Actually there are several types of brain waves in accordance with By (Chapin, 2015: 17) Regions EEG frequencies can be classified into five sections for EEG analysis, namely:

Delta (δ)   (0,5 – 4) Hz
Theta (θ)   (4 – 8) Hz
Alpha (α)   (8 – 13) Hz
Beta (β)   (13 – 22) Hz& (22-35)Hz
Gamma (γ)   (35 – 45) Hz

The result of counselee recording ie 20-30 Hz brain showed high anxiety. The red line on gmabar shows heart rate and the flow of breath is not teruatur when intervention through phobia resources given to the counselee. Through advanced stages expected counseling can alter brain waves to the alpha range low Beta.

Fostering Neurocounseling in 21st Century

Neurocounseling included in the flow multidispliner very new science will hopefully help counselors recognize and diagnosis of the implementation effectiveness of the counseling process to the counselee. If in the United States have been using EEG and Neurofeedback therapy, it is expected that Indonesia Counselors will also do the same thing. Just because of limited equipment, the cost and the development of science, so that development must begin gradually neurocounseling. According Busacca (2015: 33) neurocounseling will be one of the integrative approach in counseling. At the end of the 21st century, ACA is targeting neurocounseling will be

able to help solve a variety of problems not only in principal and pratical, but also demonstrable empirical. Counselors do not just dwell on the philosophical approach to any counseling, but also began to prove scientific that counseling services are very accountable and verifiable.

The other thing relates to the preparation of counselors in the context of perkembangn nuerocounseling are each institution will set up a professional counselor already has its own tools that are used in implementing neurocounseling such as EEG, MRI and Neurofeedback so holistic and truly comprehensive counselors will soon be realized.

CONCLUTION AND SUGGESTION

This study shows that counselee with phobia has normal brainwave according to her EEG scanning. But there are some different conditions that make her different, first she has muscle spasm that influences the heart rate and increases the respiratory rate, in case, she is in phobia intervention. EEG scan result also shows that the main brainwave that appeared significantly is Bheta with frequency in 20-30Hz. According to Chapin (2015:85) 20-30Hz Bheta is High Level Bheta which appears when someone showed high anxiety.

FORMATIVE ASSESSMENT USING FEEDBACK: EFFECTS ON STUDENTS' SELF ESTEEM IMPROVEMENT AND LEARNING OUTCOMES IN PHYSICAL EDUCATION

Komarudin

Universitas Pendidikan Indonesia
Email: komarudin_pko@upi.edu

ABSTRACT

The main purpose of this study was to explore the effects of formative assessment using feedback on students' self esteem improvement and learning outcomes in physical education. Quasi-experimental method with counterbalanced design were used in this study. Population consisting six classes of 8th grade students in Laboratorium UPI Junior High School. Two classes of samples were collected by using cluster random sampling through random selection. Students' self esteem were measured by using self esteem rating scale questionnaire, whereas learning outcomes in physical education were measured by using self assessment and observation. Friedman and Mann-Whitney U nonparametric statistics tests were used for data analysis. Data analysis suggests that: (1) There's a significant effect of formative assessment using feedback to improve students' self esteem and learning outcomes in physical education; (2) There's no significant effect of formative assessment without feedback towards students' self esteem and learning outcomes in physical education; (3) There's no different effects between formative assessment using feedback and without feedback towards students' learning outcomes in physical education. Thus, Formative assessment using feedback is better than without feedback towards students' learning outcomes in physical education.

Keywords: *formative assessment, feedback, self esteem, andlearning outcomes in physical education*

Formative assessment is the activities undertaken by teachers and students in learning PE with a view to assess themselves in order to obtain some information that will be used as feedback to improve teaching and learning activities. Atkin, Steinberg & Coffey eds., (2001) defined that, "formative asssessment is a diagnostic assessment, which provides feedback for teachers and students regarding to ongoing instructional process." An assessment called "formative" if the findings obtained were substantially used and studied to achieve the learning objectives (http://www.tki.org.nz/r/,27/12/2005on Zaenul, 2008).

Formative assessment covers all activities involving teachers and students, ranging from obtaining into utilizing information, which aims to transform teaching and learning activities in order to achieve defined instructional goals (Black & William, 1998). In accord with these opinions, the essence of formative assessment is learning outcomes assessment to improve learning process, so that teacher and student have involved together in learning process to improve approach and ongoing learning process in order to achieve more effective learning.

Misconception committed by teachers during the formative assessment, (Broadfoot, 1996; Zaenul, 2008)described thatteachers too focused on responsibility in implementing summative assessment, so it doesn't help learning process and they are simply being a judge at the end of learning process. Lack of attention to the role of formative assesment caused by several factors, (1) Educational policy, especially the national education reform conducted by external parties at macro level of school education; (2) Teachers always feel lack of time to complete curriculum content scope; and (3) Assesment hasn't became an integral part of learning process. Further, assessment is often perceived incorrectly by educational practitionaire and public communities, it has considered as the process of taking final decision on learning outcomes. It is rarely seen that assessment used as an important component in learning process. Assessment should be treated as a learning process apparatus rather than just final judgment.

Misconception specifically occurs in teaching physical education, in which teachers assess students' learning outcomes are still ignoring the learning process, it means process oriented formative assessment is often overlooked by teachers. Most of them didn't conduct formative assessment after giving a learning unit materials. Even a fraction of teachers who conduct data

formative assessment or obtained information from such assessment are not followed up by providing feedback, it implies such data are not meaning for the success of the learning process. Teachers more focused on the end of results, in the form of derived data from summative assessment which tends to undermine the learning process. If such as these conditions allowed to continue in national education system, it will be very dangerous for sustainability of education in a future especially of raisingcompetent children of the nations. Consequently, its long-term impact is that student will not have sufficient ability to prepare themselves for learning throughout life. That was also confirmed by Fook & Sidhu (2013) that, "assessment in higher education is insufficient to the task of preparing students for lifelong learning." Thus, formative assessment is very important to be returned to its role and function, that allow various strengths and weaknesses possessed by both teachers and students could be early detected. It requires involvement of teachers and students in managing the process of teaching and assessing themselves after they finished learning.In the end of learning process, the learning objectives could be reached effectively.

In the process of assessing, teachers should be able to develop students'psychological aspects, especially their self esteem. It encompasses beliefs of students towards himself, they will feel themselves competent, feel that "worthy", so the students'success and happiness developed as a provision for an independent life in order to compete in a global world today. Self esteem will be developed whenever students experience success in solving various problems in learning, success by success will be the provision on developing their self esteem. Therefore, in a formative assessment process to achieve learning success is possible along with teacher's feedback on students'work, accordingly some aspects that haven't been mastered by students have its opportunity to be fixed succesfully by students.

The Implementation of fomative assessment using feedback expected to help students improve their self esteem and students' success in their learning. In accord with this background, problems to be examined in this study are: "(1) Is there any significant effect on formative assessment using feedback towards students'self esteem

improvement and learning outcomes in physical education?; (2) Is there any significant effect on formative assessment without feedback towards students'self esteem improvement and learning outcomes in physical education?; (3) Is there any difference effects between formative assessment using feedback and without feedback towards students' self esteem and learning outcomes in physical education?.

METHOD

Methods used in this research is quasi-experimental with counterbalanced design. (Ali, 2010).Population in this study is 167 students from six class of 8th grade Laboratorium School Universitas Pendidikan Indonesia, Junior High School students. Each class consists of 28 students (Class A), 28 students (Class B), 28 students (Class C), 27 students (Class D), 28 students (Class E), and 28 students (Class F).Cluster random sampling used in this study to determine two class of samples which is Class B and Class E. There's no control group on counterbalanced design, accordingly both group of samples used as the experimental group were given physical education learning assessed by formative assessment using feedback and without feedback. Instruments used in this study areSelf Esteem Rating Scale (R=0.985) onNugent & Thomas (1993, pp.203) as many as 38 items that can be used as a data collector, whereas learning outcomes in physical education were measured by formative tests on psychomotor domain in each basketball, volleyball, softball, and shot put learning units.

FINDING AND DISCUSSION

Data collected trough measurement process were analyzed using statistical approach. Data analyzed in this study are students'self esteem, and learning outcomes in physical education. Data calculation results described in the form of average scores on each session and standard deviation for each study variables, as shown in Table 1 and Table 2.

Table1.The results of average scores calculation and self esteem variable standard deviation in physical education learning process

Variable		Total	Average	Standard Deviation
Formative assesment using feedback	Session 1	68.85	2.75	0.36
	Session 2	74.00	2.96	0.30
	Session 3	71.90	2.88	0.29
	Session 4	74.44	2.98	0.28
Formative assesment without feedback	Session 1	72.91	2.92	0.23
	Session 2	71.41	2.86	0.30
	Session 3	72.36	2.89	0.23
	Session 4	69.59	2.78	0.17

Table2.The results of average scores calculation and learning outcomes variable standard deviation in physical education learning process

Variable		Total	Average	Standard Deviation
Formative assesment using feedback	Session 1	39.50	1.58	0.40
	Session 2	48.50	1.94	0.22
	Session 3	50.00	2.00	0.00
	Session 4	49.50	1.98	0.10
Formative assesment without feedback	Session 1	41.50	1.66	0.37
	Session 2	39.00	1.56	0.39
	Session 3	43.50	1.74	0.25
	Session 4	44.00	1.76	0.36

Analysis Requirements Testing

Analysis requirements tests is necessary before the hypotesis test, to determine normal and homogenous data.Based on the test results of normality by Kolmogorov-Smirnov test at significance level α = 0.05, students'self esteem and learning outcomesdata on several meetings are not nomal. Furthermore, based on the results of homogenity by Levene Test, students' self esteem and learning outcomes data on several meetings are not homogenous.Therefore, hypothesis testing is not feasible to use parametric statistical tests. Thus, hypothesis in this study analyzed by non-parametric statistical tests using Friedman Test and Uji Mann Whitney U Test (Santoso, 2013).Test results of non-parametric statistics formative assessments using feedback through Friedman Test.

Based on hypothesis testing results, student's self esteem variable gained value sig. 0,022< 0,05 then H0 rejected.It means that there's significant effect of formative assessment using feedback towards students' self esteem improvement. Meanwhile, learning outcomes variable gained value sig. 0.000 < 0,05 then H0 rejected,it means that there's significant effect of formative assessment using feedback towards students' self esteem improvement and learning outcomes in physical education. Furthermore, based on hypothesis testing results students'self esteem variable gained value sig. 0,425> 0,05 then H0 accepted, it means that there's no significant effect of formative assessment without feedback towards students' self esteem improvement. Whereas learning outcomes variables gained value sig. 0.090 > 0,05 then H0 accepted, it means that there's no sigificant effect of formative assessment without feedback towards students' self esteem improvement and learning outcomes in physical education.

Non-parametric statistical test by Mann Whitney U used to describe the difference effects between these two assessments. Based on results using Mann Whitney U Teststudents' self-esteem variable gained value sig. 0,712> 0,05 then H0 accepted, it means that there's no significant difference effects between formative assessment using feedback and without feedback towards students' self esteem improvement. Whereas, students' learning outcomes variable gained value sig.0.000 < 0,05 then H0 rejected, it means that there's significant difference effects of formative assessment using feedback and without feedback towards learning outcomes improvement. In accord to average scores gained on each sessions of formative assessment using feedback, it is better towards learning outcomes improvement in physical education.

Formative assessment using feedback gives significant effects towards students' self esteem improvement and learning outcomes in physical education. In order to support of these findings, author cites Burn on (Coopersmith, 1967) that described, self esteem is an evaluation of individual and the habit of looking at themselves, especially the attitude of accepting, rejecting, and indication of individual's belief magnitude towards ability, significance, success, and preciousness. Self esteem is such apersonal judgment about the sense of worth or meaning that expressed in individual attitudes towards themselves. Self esteemis a person's feeling, outlook, and confidence of their ability. Ability reffered to that statement is feeling worth, feeling confident, and useful, just like everyone else. Such feeling comes with knowledge, experiences, and skills possessed by individuals after they managed to solve a problem or given task, for example formative assessment provided by the teacher in learning process. Student who are able to solve problems in such process will be ready to survive on next learning process even interacting with their environment. Zaenul (2008) defines that, students' success in the test will improve their self esteem. Both progress or regress of test results achieved by students are fully results of their own learning activities, and will lead to "a sense of personal worth" which is the most important aspects on establishment and improvement of self esteem.

Therefore, educational process especially in teaching physical education, students must be challenged so they could gain a success experience gradually to overcome challenges later. Education to

improve students' self esteem according to Zaenul (2008) described that, self development education that conducted programmatically and sustainably are not just preparing student for job seeking in a future, but it is supposed to be a successful experience to solve problems and challenges that they will faced everyday. Each taste of success experienced by each student will be their savings to develop self esteem. Ability to solve problems and challenges will be achieved when teachers are creative and responsible in providing feedback on each assessment that they do. Thus, Teacher will know whether students have succeeded or failed in terms of giving instruction to students. (Djiwandono, 2009).

Formative assessment related to improving students' learning outcomes, described by Popham (2008) that, formative assessment is "a process used by teachers and students during instruction that provides feedback to adjust ongoing teaching and learning to improve students' achievement of intended instructional outcomes." Feedback provided to students can be a positive expressions or comments and grades accompanied by explanations of their weaknesses. Page (1998) on Djiwandono (2009) defines that, students who rated and received comments from teachers about their wrong answer had better achievement than they who rated only by numbers or letters. Teacher's comments given to students is useful to understand what students have to do later.

In research conducted by Cross & Cross (1991) on Djiwandono (2009) also described that students who had their quiz rated without comments, felt that their grades gained by luck or external factors not by their efforts, and it affects their success in school. Some of these opinions confirm that, feedback given by teacher to students in comments towards their achieved results will have a positive impact on students, so they will know which parts or materials that they need to learn more, and they will able to finish the next tests properly.

Feedback that Continuously and periodically given by teacher to students on each formative assessment implementation will have an impact on students' changing behavior in learning. Budimansyah (2002) defines that: "assessments should be carried out regularly and continuously, with the purpose to make it easier organizing results, whereas the purpose of continuously is to monitor students' learning experience growth and development ." Therefore, Nadler (1977) defines, "feedback can be viewed as information to effect a change." From the psychological perspective, feedback includes a comparative aspect that includes comments given to an individual by an outside source comparing their behavior compared to a standard (Claiborn, Goodyear, & Horner, 2001). The field of education supports feedback generated from a teacher to the student regarding the student's actions, with possible means to improve. Quality of feedback includes the ability to bring about thinking, thus stimulating the reflective process in the learner (Leahy, Lyon, Thompson, & William, 2005).Thus, formative assessment without feedback has been mostly done by teachers needs to be improved by providing feedback, because the formative assessment using feedback is better than without feedback towards students' learning outcomes in physical education.

CONCLUSSION

There's significant effect of formative assesment using feedback towards students' self esteem improvement and learning outcomes in physical education; There's no significat effect of formative assessment without feedback towards students' self esteem improvement and learning outcomes in physical education; There's no difference effects between formative assessment using feedback and without feedback towards students'self esteem; and There's difference effects of formative assessment using feedback and without feedback towards learning outcomes in physical education. Formative assessment using feedback is better than without feedback towards learning outcomes in physical education.

Based on these results, author wanted to give a recommendation to physical education teachers that, formative assessment using feedback should be given by teachers in learning process because it is better than formative assessment without feedback towards students'learning outcomes in physical education.

THE DIFFERENTIATED INSTRUCTION IN DANCE LEARNING AND THE PROBLEM

Kusnadi

Postgraduate University State of Malang

Email: kusnadi13@yahoo.com

ABSTRACT

This paper is intended to discuss the implementation of differentiated instruction strategy in dance learning. This strategy was chosen to maximize the potential of students in appreciate, expression, and creativity. Conventional learning has several deficiency: (1) aspect of art appreciation is less explored to the fullest, especially in the dimension of feeling, (2) differences in interest in art inadequately accommodated in the praxis of learning, (3) gender differences have received less attention, especially in terms of choice of expression / creativity, and (4) the implementation of appreciation and expression is carried out separately that caused no continuity of students' interaction with the artwork are studied. Problematic use of differentiated instruction in learning the art of dance in schools is the limited hours of lessons and mindset of teachers who are still based on behavioristik approach. The proposed solution is: (1) integrate the activities of art appreciation and expression/ creative art of dance in a series of activities, (2) accommodate the interests of students are limited by considering gender and artistic tastes, (3) implement all activity with experiential learning with 'gradual release', and (4) utilizing school environment.

Keywords: differentiated instruction, dance learning

Naturally, every student is different in many ways. Many individual differences in theory affect the students' learning activities, among which are: (1) the cultural, ethnic, and racial, (2) differences in language, (3) gender differences, and (4) social class differences. In addition, there are internal factors that distinguish the other student with other students in learning, which is characteristic of students in terms of: (1) learning styles, (2) cognitive style, (3) learning preferences, (4) multiple intelligences , (5) interest and (6) the readiness to learn (Arend, 2007). So that learning outcomes can be maximized, a variety of diversity requires the teacher's attention. One form is the selection of learning strategies diversity merspon various conditions such students.

On learning the art of dance in schools where students are relatively homogeneous, especially in terms of culture and language, individual differences that need to be considered in the selection of learning strategies is directly related to the interest in the art of dance, gender, and the initial experience. These three things need to be accommodated for the purpose of learning the art of dance in schools can be achieved to the fullest. Thus, each student will be able to evolve any potential art in accordance with their interests, early experience, and gender condition. One form of the diversity of the

student accommodation is dipergunakannya differentiated instruction.

Tulbure (2010) in research experiments conducted on Pre-service teachers, produced findings that differentiated instruction has a positive impact on academic achievement. While the research conducted by Karadag & Yasar (2010) conducted on students aged 5 years in Turkey showed that differentiated instruction positive effect on students' attitudes towards learning. Students assume that the differentiation of learning is better than the konventional learning, and more entertaining (fun).

DISCUSSION
The Concept of Differentiated Instruction

Differentiated Instruction (DI) is an approach that allows teachers to design learning strategies tailored to the needs and readiness of each student. This approach does not use a single strategy, but rather a learning approach that incorporates various strategies. In other words, DI is a responsive learning designed to meet the unique needs of individual students (Watts-Taffe at al., 2012: 304). DI is often referred to as a responsive learning (Watts-Taffe at al, 2012), and an adaptive learning (Arends, 2007a). DI allows all students to access the curriculum of the same class by providing a learning task, and the results that are tailored to the learning needs of students.

DI based on the belief that there is a diversity that occurs in a group of students, and the teacher responds to diversity by selecting a suitable approach for their learning (Tomlinson, 1999, 2001). This approach is based on the thoughts of: (1) the difference in developmental and cognitive abilities, (2) the theory of "zone of proximal development" of Vigotski, (3) the theory of Multiple Intelegency of Gardner/ Stenberg, and (4) the difference in styles and learning preferences (Arends, 2007a; 2007b).

Tomlinson (1999; 2001; 2006) states that DI can occur by focusing on three aspects: (a) the process by which students learn, (b) the products of their learning, and (c) the content they are learning. DI on the means of selecting some activity or learning strategies are explored from the concept of a unit of study based on the interests of students, cognitive capacity, or learning style (Tomlinson, 1999.2001). DI in products include variety of learning products produced or demonstrated by the student in accordance with the level of mastery of subject matter unit (Tomlinson, 1999.2001). DI on content means that teachers can provide a different lesson content tailored to the needs and readiness of students according to the results of the initial assessment (Chien, 2012; Tobin & McInnes, 2008).

One of the key practices to differentiate learning is the use of flexible grouping. (Arends, 2007a). Flexible grouping is an attempt to place students into groups smaller for subjects and specific activities. To be flexible grouping to be successful, Arends (2007) suggested six things that must be considered by the teacher, namely: (1) an accurate diagnosis of the performance and prior knowledge, (2) the differentiation of curriculum and instruction, (3) the identification of the learning community regular classes, (4) maintain the temporary nature of small groups and flexible, (5) continuous assessment, and (6) work is meaningful and honorable for students in all groups.

Watts-Taffe at. al. (2012), which implements the DI in the field of literacy propose steps DI as follows: (1) a prior assessment of students, (2) determining the differentiation strategy, (3) to form small groups of blocks of literacy, (4) fit the text to the reader, and (5) using a gradual release. A prior assessment is required before to the start of DI. The purpose of this assessment is to accurately determine individual differences of students in various ways, such as their ability, their interests, their multiple intelligences, learning styles, learning preferences, cognitive styles, and its locus of control. Prior assessment can be made on some aspects in accordance with the conditions and readiness of teachers.

Determination of differentiation strategy is based on the results of the prior assessment and conditional factors, such as differentiation strategy chosen is the differentiation process, content, or product (Tomlinson, 1999, 2001) or some combination of all three. Determination of differentiation strategy is also adapted to the characteristics of the subjects. The formation of small groups are the hallmark of the DI. The formation of these groups is done flexibly adapted to certain similarities between group members. DI is not a classical learning but also not learning ididual. Adjustment of text on the reader (in literacy), can be transferred in a wider sense that provide materials, different learning activities to students based groups that are tailored to the needs, readiness, or the interests of students. Gradual release in this concept is the release of teachers teaching responsibilities gradually towards active learning centered on the student.

Adami (2004) tries to explore various forms of DI approach. Research will be undertaken in Malta indicate that there are many variations of differentiation that can be carried out by teachers include the differentiation of interests, content, rate of speed, access, response, sequence, structure, time, teaching styles, and grouping. These results provide a broader picture regarding the implementation of the DI of the original ideas are only three things that differentiate content, process, and product (Tomlinson, 1999, 2001).

Based on the various theories and research findings above can be identified some of the characteristics of the application of DI in learning, namely (1) prior assessment that is meant to determine the individual characteristics of students, especially in terms of their interests, prior abilities, learning styles, learning preferences, gender, and multiple intelligent; (2) determine the type of relevant differentiation (3) to form small groups; (4) adjusting the materials and activities to student characteristics, and (5) gradual release that guide students toward active learning step by step.

Application of Differentiated Instruction in Dance Learning and the Problem

Learning the art of dance in the school has a dual purpose in addition aims to enable students to have an aesthetic experience, is also intended to foster student appreciative attitude towards art and culture of the nation. This means that the two main aspects of the dance should get equal attention, namely the appreciation of the art of dance and expression/ creative dance. In the praxis of learning the art of dance in the school, two aspects are mostly studied separately. Appreciation dance performed by learn of dance knowledge that includes the definition of dance, types of dance, elements of dance, dance styles, and aesthetics. Expression/ dance creations embodied in the form of teacher-led learning to dance in the classical and usually followed by creativity in floor design and level. Moot it is done with a classical approach, meaning that all students are treated equally without exception.

Judging from the relevance of the implementation of learning with the achievement of the ultimate goal of learning, there are some disadvantages learning practices the art of dance conventionally, namely: (1) aspect of art appreciation is less explored to the fullest, especially in the dimension of feeling, (2) differences in interest in art inadequately accommodated in praxis learning, (3) gender differences have received less attention, especially in terms of choice of expression/ creativity, and (4) the implementation of appreciation and expression is carried out separately that caused no continuity of students' interaction with the artwork are studied.

One approach offered to solve the problems mentioned above is to DI. This approach was chosen to maximize the potential of students in appreciate, expression, and creativity. However, the use of DI in learning the art of dance in schools is also no obstacles, namely (1) the limited hours of lessons, and (2) mindset of teachers who are still based on behavioristik approach. Therefore, to overcome these weaknesses is done by the following solutions: (1) integrate the activities of art appreciation and expression / creative art of dance in a series of activities, (2) accommodate the interests of students are limited by considering gender and taste of art, (3) implement all activity with

experiential learning with 'gradual release', and (4) utilizing school environment.

Integration of Art Appreciation Activity and Expression / Creative Arts

Learning a limited time constraints and the complexity of aspects of the art that was developed in learning the art of dance in schools requires the integration of activities of art appreciation and expression/ artistic creations in a series of activities. In the context of art appreciation, appreciation passive in the sense of enjoying the dance art work should be continued with an active appreciation activities, ie trying to feel dancing activity and creation of dance works. Indeed, when someone finishes enjoy the artwork will appear aesthetic ideas that need to be expressed. Thus the teacher needs to facilitate the need for students to express themselves in accordance with the initial understanding of the capabilities that have been owned by the students.

Accommodating Students Interest in the Limited

Interests art students clearly vary both in terms of the background of gender or personal taste. If the learning is done in the classical style, not all students are accommodated interests which impact most of them do so reluctantly. On the other hand, if the individual interests are accommodated in the form of individual learning allows less time and it will be difficult to do in class. Learning the art of dance in both junior high school or high school / vocational school for only two hours a week, and even then had to share time with art and music. Then the solution is to differentiated interest limited as follows.

In the expression activity (dance) teacher provides a choice of 2 different material but similar level of difficulty. Students choose one of the materials in accordance with the expression of interest. Thus will form two large groups of students with different materials. To accelerate mastery of materials teachers need to prepare instructional media such as video both interactive and non-interactive.

In the expression activity, the teacher makes small groups whose members are selected based on shared interests. For example, when appreciation is directed at the type of 'sendratari' (ballet), students can choose the characters in the ballet as a starting point expression activities. If the

appreciation is directed at a single type of dance, students can be grouped on the type of dance she likes. Of course the type of dance that is appreciated by passively amount more than the active appreciated.

Use of Experiential Learning with 'Gradual Release'

Experiential Learning is an authentic experience-based learning learners. There are two important characteristics of experiential learning, namely: (1) the involvement of learners in concrete activities that allow them to "experience" what they learned, and (2) an opportunity to reflect on these activities (Silberman, 2007). On learning the art of dance in schools, form the most effective experiential learning for appreciation is by interacting directly with the work of dance and its artists, especially in the form of watching the show live in the community. Can also be able to bring artists to enter the school for the stage, dialogue, and practicing dance together. It could also take advantage of class brothers to learn together. If everything is not possible new uses video media assistance.

'Gradual release' in learning the art of dance school is defined as the management role of the teacher in learning, especially in the activities of expression and artistic creation. In the early days of learning the teacher's role is still dominant role as a coach in artistic expression. In the next phase of this role is slightly reduced by utilizing other friends in the group and the role of video media. At this stage of creation, the role of teachers as facilitators. Students are given the opportunity to create their own according to their interests.

Utilizing the School Environment

The limited hours of lessons on the side can be addressed substantively by integrating aspects of art appreciation and expression/ artistic creations, can also be overcome technically by using time outside of school hours. In Curriculum 2013 is no principle that learning can be done anywhere and at utilizing the potential and agenda dance performance in the environment around the school. Teachers need to identify performances of dance performed regularly around the school as a learning resource.

In contrast to the problem of learning time, the problem requires a change of mindset relatively long time. Traditionally many teachers are accustomed to learning based on learning theory behavioristik. When the Curriculum 2013 that is more constructivist implemented, training and socialization strategies and learning model that many are based constructivist approach must constantly be done by not closing the possibility of developing new learning models that match the characteristics of the subjects.

CONCLUSSION

The success of learning the art of dance in schools in addition is determined by the approach, strategy, or learning model used by teachers was also determined by a better understanding of the characteristics of the subjects and characteristics of students with a wide range of individual differences. Naturally gender differences and artistic tastes will take students on a different interest in art activities. The potential of art students will develop optimally with DI as a learning approach that accommodates differences in students.

These weaknesses in learning approaches conventional behavioristik and the limited learning time can be treated in several ways, namely, (1) integrate the activities of art appreciation and expression / creative art of dance in a series of activities, (2) accommodate the interests of students are limited by considering gender and artistic taste, (3) implement all activity with experiential learning with a 'gradual release', and (4) exploit the potential of the school environment. However, to change the mindset of teachers towards learning takes a long time and need continuous efforts in the form of training models of learning based on constructivist approach and the development of new learning models that match the characteristics of each subject.

IMPLEMENTATION OF INFORMATION SYSTEM ON AUTHENTIC ASSESSMENTIN PRE-SCHOOL AND KINDERGARTEN RAUDHATUL JANNAH WARU SUB DISTRICT, SIDOARJO

Leni Gonadi

Early Childhood Education, State University of Malang
Email: lenigonadi@gmail.com

ABSTRACT

The present study aims to: 1) describe the implementation of information system in the implementation of authentic assessment in Pre-school and Kindergarten Raudhlatul Jannah in WaruSub District, Sidoarjo 2) describe the extent to which the information system used in accordance with the implementation of authentic assessment in 2013 Early Childhood Curriculum. This study uses a qualitative approach with qualitative descriptive research. The research location is in Pre-school and Kindergarten Raudhlatul Jannah, Waru Sub District, Sidoarjo. The data source of this research is teachers, assessment information system, and documents. The data is collected through interviews, observation, and documentation. The research findings indicate that the implementation of information system of authentic assessment is carried out through the stages of including the assessment results in information system, and saving and printing the results of the assessment. Based on the data analysis, it is concluded that 1) the implementation of information system of authentic assessment in Pre-school and Kindergarten Raudhlatul Jannah, Waru Sub District, Sidoarjo is performed by entering the data on the assessment information system, and saving and printing the reports, 2) the information system used so far is still focusing on entering, storing, and printing the data. Based on the above study, the proposed suggestions are teachers need to improve the skills of mastering information technology, and there is an urgent need for assessment of information system in accordance with the characteristics of authentic assessment in 2013 Early Childhood Curriculum.

Keywords: information system, authentic assessment

Implementation of authentic assessment has been a familiar discussion in early childhood education. In previous curriculums, the assessment made in early childhood education institutions is conductedby assessing the learning process and results. Assessment is not just how children achieve their outcomes, but also their process to achieve them. Assessment that includes assessing the process and results of children's achievements refer to an authentic assessment.

Authentic assessment in Curriculum 2013 is "assessment of learning processes and outcomes to measure the level of achieving competence attitudes (spiritual and social), knowledge and skills of an ongoing basis". Assessment does not only measure what children know, but there is an emphasis to measure what they can do. Measuring is an initial stage of reporting the development of children to parents. Assessment is carried out before the next stage of evaluation. "It means that this activity is carried out sequentially, starting with the measurement, assessment, evaluation and reporting" (Basuki and Hariyanto, 2014: 10). Assessment in early childhood education is an important process to determine the child's development.

Rules by Minister of Education and Culture No. 146, 2014 on Curriculum 2013 Early Childhood Education mentions "assessment is the process of collecting and processing information to measure the achievement of children's learning activities". Teachers have a very important role in assessing the processes and results of early childhood development. Teachers need an understanding and knowledge of the curriculum, of early childhood competence, and of performance characteristics of the stages of early childhood development.

This 21st century teachers got a new challenge to constantly improve their competence with the times. Teachers can always provide innovation in the implementation of learning. Human Resources (HR) need to answer the challenges of the 21st century as stated in the principles of introduction of Curriculum 2013 (2014: 8) "human resources that are skilled in the lives and careers are those with the skills of 4C learning, namely: critical thinking, communication, collaboration, creativity, and skills to master technology, information, and media". Early childhood teachersare expected to have criteria of the above-mentioned human resources.

The era of technology, as mentioned previously, bring changes and development in various aspects of life, as well in the field of

education. The magnitude influence of information and communication technology brings its own role as a supporter for a good education system and media education. Haryanto, Ariani (2010: 172) mentions the use of information technology that includes three related activities, namely: (1) learning by utilizing information and communication technology, where teachers and children use ICT as a learning resource, learning tool, and means of learning communication. (2) data processing, information management, management system and electronic school works. (3) utilization of advanced information technology and communication for education services that can be accessed easily and affordably by people in all regions of the state. Improving the quality of learning by utilizing information technology can be performed through the implementation of information system in an authentic assessment.

Based on the results of field observations conducted in October 2014 in Pre-school and Kindergarten Raudlatul Jannah Sidoarjo and interviews with the principal and early childhood teachers, it is obtained that the reportingsystem used in Pre-school and Kindergarten Raudlatul Jannah isconducted through computer information system, in the form of printout report that is indicated with the level of achievement in a coding system. However, there are some discrepancies in the implementation of information system in authentic assessment that are not in accordance with the 2013 early childhood curriculum.

METHOD

Based on the presented background, this study aims to investigate further the implementation of information system of authentic assessment in early childhood institutions. Curriculum reference used is the 2013 early childhood curriculum. This study will describe the implementation of information system of authentic assessment, and the extent to whetherthe existing information systemis in accordance with the characteristics of authentic assessment.The research method uses a qualitative approach. This type of research is qualitative descriptive because in this study there will be descriptions of the circumstances that occurred in the field. Researcher acts as the main instrument at the same time data collector. The research is conducted in Pre-school and KindergartenRaudlatul Jannah Sidoarjo. Sources of data in this study are divided into two, namely primary data sourceand secondary data source. The sources of primary data consists of the principals and teachers, while the

secondary data source consists of photographs of school activities as well as the printed documents of information system. Data is collected through interviews, observation, and documentation of the assessment of information system. Data analysis is presented in the stage of data reduction, data presentation, and conclusion. In this study,data validity control done through perseverant observation, triangulation, adequate referential, and checking members.

RESULT AND DISCUSION
Results
Implementation of information systems on the implementation of authentic assessment in Pre-school and KindergartenRaudhlatul Jannah, WaruSidoarjo.

The assessment of information system is divided into three phases, namely the stage of entering the assessment on information system, the stage of storing and printing the assessment results. In entering stage,teachersenter the assessment in the form of a code of achievement. Inthe stage of storing,teachers keep the records in accordance with the child's name. Printing stage is carried out by printing the indicator report.

Based on the observation, interview and documentation in the implementation of information systemof authentic assessment begin with the stage of entering the results of the assessment. Assessment is taken during the learning processin which there are two teachers in a classroom. In addition, the learning activities are based on the daily lesson plan (RPPH) that has been developed by the teachers in Pre-school and Kindergarten RaudhlatulJannah. The learning is implemented in school subjects designed by the teachers.The variations of school subject have been set up in the early years of learning. Children in Pre-school and KindergartenRaudhlatul Jannah play and learn with their own school subjects and activities. When the activities take place, teachers will role as facilitators and the children will choose the activities according to their interests.

Teachers manually record the process and the results of the children development during the learning activities within a day. Teachers take note on any developmental outcome of the children with the attached format in the daily lesson plan (RPPH). Teachers indicate the note with development achievement codes, such as BB that means undeveloped yet; MB means begin to develop; BSH means developing appropriate with expectations; BSB means developing very well. After going through the manual recording, the recording is analyzed by the teachers. The results of the analysis are stored in the form of notes in accordance with the children's names.

The results of daily assessment has been analyzed according to the children's name. Each assessment is collected daily. When near the end of the semester, each daily assessment will be collected and analyzed by the teachersand the results of the assessment will be included in the information system assessment. The process is done by the teachers ofhomeroom. The teachers enter the results of the analyzed assessment in the information system.

The process of inserting the assessment in information systemis carried out by manually selecting the code that corresponds to the analysis results. Code achievement is called level, i.e. E (Excellent) / special to BSB means developing very well, VG (Very Good) / very good for BSH means developing appropriate with expectations, G (Good) / well for MB means begin to develop, S (Satisfactory) / MB means sufficient to begin to develop and NI (need improvement) / needs improvement to BB means undeveloped yet. Teachers open the half report menu that is available in the information system, and then enter the username as the homeroom teachers. Afterwards, they search menu corresponding to analysis results at each school subject, opening the menu school subjects (Religions, Preparation, Blocks, Role Playing, Nature Materials, Art, Exploring Class, Multimedia Class, Typical Curriculum and Personal Development).

The process of choosing school subject is followed by searching the child's name and school year (academic year), and then followed by posting a teacher's comment that reflects the overall development of children according to the school subjects. What happens next on the menu is the option of skills, values, and achievements. Here, the teachers have to choose the existing development skills and values on the menu by clicking on the appropriate target with the results of assessment. Option listed on the menu skills and values are the indicators of performance skills and values, and the achievement of the so-called choice level E (Excellent) / Special to BSB means developing very well, VG (Very Good) / very good for BSH means developing appropriate with expectations, G (good) / well for MB means begin to developing, S (Satisfactory) / MB means sufficient to begin to develop and NI (need improvement) / needs improvement BB means undeveloped yet. Teachers will then click the appropriate children's development outcomes.

The next choices are the menus of development and indicators that encompass menu ofskills of achieving development, menu

of development achievement, indicators, and levels. Teachers choose a menu according to the results of the analysis and then enter the results into appropriate level.

The next process in the assessment of information system in Pre-school and Kindergarten RaudhlatulJannnah is storing stage. Teachers store the assessment results in the information system according to the name of each child. Storage process is done by selecting the save menu on the screen. Furthermore, teachers can continue to process the other school subjects following the same method. The processes of information systems of this assessment are conducted by the homeroom teachers in accordance with the results of assessment in each school subject.

The extent to whether the information system is used in accordance with the implementation of authentic assessment in 2013 early childhood curriculum.

Rules of Minister of Education and Culture of the Republic of Indonesia Number 146, 2014 about Curriculum 2013 Early Childhood Education mention that "assessment of process and learning outcomes are to measure the level of achievement of competence attitudes (spiritual and social), knowledge and skills on an ongoing basis".Assessment does not only measure what children know, but also what they can do.

Wortham (2005:13) states authentic assessment as follows:

> Within this evolution in the purposes for assessment and interpretation of assessment is the move to authentic and performance assessment. Authentic assessment must have some connection to the real world; that is, they must have a meaningful context. They are contextual in that they emerge from the child's accomplishments.

Authentic assessment should be completely connected to real life, so that it actually produce meaningful assessment. Authentic assessment is done in accordance with the assessment exercise in early childhood education institutions.

Based on interviews, observation, and documentation of authentic assessment with the information system implemented at Pre-school and KindergartenRaudhlatul Jannah Sidoarjo,the assessment during the learning process is carried out manually by recording the results of the assessment on the assessment sheet. Teachers will then observe the learning process in each school subject and fill out the assessment format with codes BB, MB, BSH, and BSB.

The assessment conducted on the process and learning outcomes is done every day according to the rotation of school subjects. The assessment is conducted by marking a checklist on each code corresponding with the achievements of the

children's development in each child's name sheet. The learning activities are adapted to the design of lesson planning. The children will focus on working on their tasks while the teachers will monitor them.

The next stage,the teachers will analyze the results of the assessment. The results of the analysis are collected for inclusion in the assessment of information system. Having put all the results of the assessment analysis of children, the teachers will store the results of such assessments. The children's masterpiece is stored in portfolio that has been organized in each child's locker. At the report day of children's achievement during the learning, teachers give the printout of the reports along with the children's portfolio.

Homeroom teachers will then include the results of analysis carrying out assessments of educators in each school subject. The results are then saved in information system.

Discussion
Implementation of information system of authentic assessment in Pre-school and Kindergarten Raudhlatul Jannah, Waru Sidoarjo.

Based on the data collection in the field,the implementation of authentic assessment with the information system in Pre-school and KindergartenRaudhlatul Jannah Sidoarjo includes the step of inserting the assessment on information system, saving, and printing the results of the assessment. This is in accordance with the opinion of Barret (1994) in a publication in March 1994 with the issue of The Computing Teacher, the alternative assessment supported by the application of technology is divided into two major categories, as follows: (1) program which electronically record and store teachers' observations or anecdotal data about the child's learning (i.e., observational assessment software), and (2) electronic portfolio that digitizes and stores a collection of artifacts from the children's portfolio using a variety of technologies and multimedia elements.

Implementation of authentic assessment with the information system in the school includesassessment observation software that includes the step of inserting assessment results, storing them and finally printing the results out to be distributed to the children's parents each semester. The information system does not include electronic portfolio because it is stored only in the form of documents and not digital.

The extent to whether the information system is used in accordance with the implementation of authentic assessment in 2013 early childhood curriculum.

Based on the data collection in the field, the implementation of authentic assessment with the information system in Pre-school and KindergartenRaudhlatul Jannah Sidoarjo includes the step of observing the process and learning outcomes and it is appropriate with the authentic assessment characteristics, as summarized by Basuki and Hariyanto (2014: 171) as follows: (a) involving a real experience (b) carried out during and after the learning process takes place (c) including a personal assessment (d) measuring skills and performances, not considering the fact (c) continuous (f) integrated (g) can be used as feedback (h) the criteria of success and failure that students know clearly (i) using a variety of instruments, measurement, and methods appropriate with the characteristics and essence of the learning experience (j) is comprehensive and holistic covering all aspects of the learning objectives.

Authentic assessment has characteristics that emphasize that the measuremendoes not consider the fact, use a variety of instruments, measurements and methods appropriate with the characteristics of competence and is covering all aspects of development.

Kostelnik et al (2007: 170) describes the characteristics of authentic assessment as follows: (1) a variety of the data is collected across time; (2) all developmental domains are of interest; (3) it takes place in the natural learning context; (4) it is functional and curriculum embedded; (5) it is based on discovering children's best performance; (5) it is useful for planning classroom instruction; (6) it is a shared responsibility.

Natural learning context which will showcase the best work of children is a shared responsibility between teachers, children, parents, and the people who are interested in the early childhood education. Characteristics of authentic assessment provides an opportunity for teachers to construct a class to be more appropriate to the achievement of the child's development.

Authentic assessment activities cover the entire learning. Rubric, portfolio, video recordings and records of anecdotes are types of an assessment tool that have been implemented in early childhood education. The information system is used in pre-school and kindergarten Raudhlatul Jannah Sidoarjo is still so far on entering, storing, and printing the reports.

CONCLUSION AND RECOMENDATION
Conclusion
Based on the findings of the research and discussion, it could be concluded as follows. Implementation of information systems of authentic

assessment in Pre-school and Kindergarten Raudhlatul Jannah WaruSidoarjo is performed by entering data on the assessment information system, saving and prining the reports ofthe child's development with level code, such as E (Excellent), VG (Very Good), G (Good), S (Satisfactory), and NI (Need Improvement).

Information system used is still so far done by entering, storing and printing the performance reports of children's development and portfolios in the form of a document of each child's achievement at the end of the semester which are handed over to the child's parents.

Suggestion

We recommend that educators need to improve the skills of mastering the information technology. It is recommended to have an information system that actually assesses children's development in accordance with the characteristics of authentic assessment in 2013 early childhood curriculum.

ABSTRACT

This study aimed at identifying/investigating the practices of Elementary and Secondary Teachers in the implementation of K+12 curriculum and the underlying problems along with its implementation with an end view of determining the teachers' best practices to come up with a more effective implementation of the Senior High School. The research work used percentage and mean to analyze demographic profile and responses and Pearson r to determine whether the relationship between practices and problems existed. The findings revealed that in the initial implementation of the K+12 Curriculum, the teachers were able to refine best practices in three areas of the five identified areas of concern. There were no identified best practices in learning resources as well as teaching strategies and techniques This research endeavor was delimited to the teachers who are under K+12 curriculum for the S.Y. 2014-2015. This study provided significant information on which best practices are needed to be adapted and which problems are needed to be addressed for the learners' benefits. The study employed a descriptive-correlation research to identify the best practices and determine the most pressing problems among teachers in the initial implementation of K+12. The results of data gathered were correlated to be the bases for the effective implementation of Senior High School.

Keywords: K + 12 curriculum, best practices and problems in the areas of: teaching preparation/readiness

Education in its general sense is a form of learning in which the knowledge, skills, and habits of a group of people are transferred from one generation to the next through teaching, training, or research. Education frequently takes place under the guidance of others, but may also be autodidactic. Any experience that has a formative effect on the way one thinks, feels, or acts may be considered educational. Education is commonly divided into stages such as preschool, primary school, secondary school and college, university or apprenticeship.

Education has always been considered a vital factor in achieving the general objectives of national development and progress.

Section 1 Article 14 of the 1987 Philippine Constitution provides that "the state shall protect and promote the right of all citizens to quality education at all levels" and Section 2 of Republic Act 7722 otherwise known as the Higher Education Act of 1994 mandates that "the State shall protect, foster and promote the right of all citizens to affordable and quality education at all levels". To promote such provisions the government continuously explores innovative programs and measures to improve the educational system. In its effort to effect quality education, the current administration through the Commission on Higher Education (CHED), the Department of Education (DEPED) and the Technical Education and Skills Development Authority (TESDA) is deliberately undertaking a paradigm shift in order to design a new educational landscape that would make Filipino graduates at par or even better than their counterparts abroad.

The CHED recently issued Memorandum Order No. 46 series of 2012 with subject "Policy Standard to Enhance Quality Assurance in Philippine Higher Education through an Outcomes- Based and Typology- Based Quality Assurance". This policy standard is intended "to enhance the quality assurance system of Philippine higher education through learning competency based standards and an outcome-based system of quality assurance…" It mandates among others, "Philippine higher education to produce thoughtful graduates imbued with values reflective of a humanist orientation, analytical problem solving skills, the ability to think through ethical and social implications of a given course of action, the competency to learn throughout life, and to produce graduates with high levels of academic,

thinking, behavioral, and technical skills/competencies that are aligned with national, academic, and industry standards and needs and international standards…"

On the part of DEPED, it constituted a functional partnership with TESDA to configure an enhanced basic education by adding senior high school in basic education and formulating a relevant and responsive curriculum. This initiative is articulated in Republic Act 10533 known as Basic Education Act of 2013. The Act provides that it is the policy of the State to empower every basic education graduate who has learned the following: life-long foundations of learning, work competency and productivity, harmonious coexistence with local and global communities, creative and critical thinking and transformation of oneself and others. Therefore, the State should create a functional basic education system that will develop productive and responsible citizens equipped with the essential competencies, skills and values for both life-long learning and employment". The discharge of this directive has been assigned to the DEPED that is mandated first and foremost to "give every student an opportunity to receive quality education that is globally competitive based on the pedagogically sound curriculum that is at par with international standards".

As an investment in the nation's economic recovery, social unity, and political stability, education calls for a sincere and full commitment by the political leadership and all sectors of society to give the children and youth all the opportunities for acquiring and developing necessary skills, attitudes, values and scientific creativeness to become self-sufficient, self-reliant, and ultimately lead a useful and productive life in a fast changing modern world.

It is well established that improvements in education are associated with long-term improvements in economic performance. There are three broad theories about how education influences economic performance:

- The basic human capital approach is that education improves the overall skills and abilities of the workforce, leading to greater productivity and improved ability to use existing technology, and thus contributing to economic growth.
- The innovation approach links education to improving the capacity of the economy to develop new ideas and technologies.
- An extension of this is the knowledge transfer approach, which sees education as a means of spreading the knowledge needed to apply new ideas and make use of new technologies (OECD, 2010a).

However, there is an important question as whether there is a causal link between education and economic performance, and if so, in what direction? It may be that the two are associated, but not causally linked. It also could be that better economic performance leads to an increase in educational participation and achievement. Or it could be that having more people with education leads to improved economic performance.

In general, education and economic performance are likely to be interlinked. Having a more educated workforce enables firms to take advantage of new economic opportunities, leading to improved performance. Also, economic growth can lead to greater national and personal wealth, which increases the resources available and opportunities for education. Economic analysis shows that on the whole, improvements in school-level education lead to improvements in economic performance, and more so than the other way around. Analyses using international cognitive tests have shown that it is improvements in cognitive skills, rather than years of schooling, which have a strong influence on economic growth. The amount of schooling undertaken is not related to growth, unless it also results in improved cognitive skills. Therefore, the quality of education is very important (OECD, 2010a).

The evidence about the relationship between tertiary education and economic performance is less clear. Long-run analysis of the economy has shown that increased tertiary education is related to economic performance. Razzak and Timmins (2010) showed that increases in the proportion of employees with bachelor's degrees and above are highly correlated to increases in the average gross domestic product per person. However, it is not clear if the growing economy attracted more degree-qualified workers or the increase in degree-qualified workers stimulated economic growth, or a combination of both.

According to President Benigno Aquino III, "Education is the key to the long-term problems of the country. If we fix basic education, we fix the long-term problems of the country. And if we fix the country's problems, we will build a truly strong society."

Education will contribute to economic growth. Several studies have shown that the improvements in the quality of education will increase GDP growth. A better educated society provides a sound foundation for long-term socio-economic development.

According to the human capital theory, the economic development of a nation is a function of the quality of its education. In other words: the

more and better educated a people, the greater the chances of economic development.

It has been argued that high rates of education are essential for countries to be able to achieve high levels of economic growth. Empirical analyses tend to support the theoretical prediction that poor countries grow faster than rich countries because they can adopt cutting edge technologies already tried and tested by rich countries. However, technology transfer requires knowledgeable managers and engineers who are able to operate new machines or production practices borrowed from the leader in order to close the gap through imitation. Therefore, a country's ability to learn from the leader is a function of its stock of "human capital". Recent study of the determinants of aggregate economic growth has stressed the importance of fundamental economic institutions and the role of cognitive skills.

The modern world in which we live is often termed a "knowledge society"; education and information have become production factors potentially more valuable than labor and capital. Thus, in a globalized setting, investment in human capital has become a condition for international competitiveness.

In a forum, Juan Miguel Luz, a former Department of Education Undersecretary, stated that the quality of the Philippine education has really been declining continuously for roughly 25 years. Describing the quality of Philippine school education today, another senior Department of Education official stated the following: "Our schools are failing to teach the competence the average citizen needs to become responsible, productive and self-fulfilling. We are graduating people who are learning less and less."

Apart from the above-mentioned statements which came from the country's former educators, another set of facts came out that the Philippine Educational system is continuously declining. Guillermo M. Luz, co-chairman of the National Competitiveness Council presented the result of the recent Global Competitiveness. Report on the World Economic Forum which showed the Philippines ranks a poor seventh among nine Southeast Asian nations in the area of education and innovation. The report also showed that the Philippines only fared better than Cambodia, among the Southeast Asian countries that were surveyed in the field of education, science and technology, and innovation. Of 138 countries, the Philippines ranked 98th in economies, 69th in the educational system, 112th in Science and Math, and 76th on the Internet access. In all

categories the Philippines was falling behind Singapore, Brunei, Malaysia, Indonesia, Thailand and Vietnam.

The educational status of the country is parallel to its economic status. This supports what Ronald Meinardus wrote in his article that the economic development of a nation is a function of quality education. It only means that if the Philippine economy would be the basis of identifying how much quality its educational system possesses, one would come up to a conclusion that the country has a poor educational system.

There are lots of factors which hinder Filipinos from achieving quality education. Almost all Filipinos already know this. As a matter of fact, when Luz delivered this statement about how the quality of Philippine education is, no one in the forum disagreed. Apart from the fact that the government and non-government people have identified those factors; some already proposed different possible solutions on how the Filipinos can uplift the quality of education.

One measure taken by the government specifically by the Department of Education is the implementation of the enhanced basic education curriculum - the K+12 basic education curriculum. This would strengthen the education of the country which would expectedly result to production of better and competent graduates. The K+12 basic education curriculum framework supports the primary goals of education which are: (a) a primary goal of education should be the development and deepening of the students' understanding. Students reveal their understanding most effectively when they are provided with complex, authentic opportunities to explain, interpret, apply, shift perspective, empathize, and self-assess. When they applied the complex tasks, these six facets provide a conceptual lens through which teachers can better access student understanding. (b) student and school performance gains are achieved through regular reviews of results (achievement data and student work) followed by targets and instruction. (c) teachers become most effective when they seek feedback from students and their peers and use the feedback to adjust approaches to design teaching. Teachers, schools, and districts benefit by working smarter through collaborative design, sharing and review of units of study.

The above-mentioned key ideas are the bases on how the K+12 framework is implemented in teaching. This framework aims at enhancing the teacher's role as designer of student learning.

Because of its success in the United States and other countries across the globe, it slowly made its way to the Philippine Educational System.

The K+12 Basic Education Curriculum framework was formally implemented in the

Philippines through the Enhanced Basic Education Act which was implemented in SY 2012-2013. It was implemented in all public and private schools across the country.

The implementation of the K+12 curriculum has been running for two years now. However, not all teachers could easily adapt to this sudden change. Different teachers with different types of learners have various observations and experiences towards the implementation of the framework. Inevitably, there are some problems met by the teachers in implementing the K+12 framework in teaching, thus the need of this study.

This study aimed at identifying and investigating the practices of Kindergarten, Elementary and Secondary Teachers in the initial implementation of the K+12 curriculum and the underlying problems along with its implementation with an end view of determining the teachers' best practices to come up with a more effective implementation of the K+12 Curriculum.

METHOD

The descriptive method of research was used and a validated questionnaire was employed to determine the teacher-respondents' best practices and problems in the initial implementation of the K+12 curriculum. Ninety-three kindergarten, elementary and secondary school teachers of the Infanta District, Province of Quezon, actually participated in the study.

RESULT AND DISCUSION
Results
Profile of Respondents

Age of respondents. As shown on the table, there were only 36 (39%) teachers whose age brackets range from 20 t0 30 years old. Thirty seven (37) or 40% of the teachers belong to the 31 to 40 years age bracket while 13 0r 14% of them were within the 41 to 50 years age bracket. Six (6) or 6% of the teachers belong to the 51 to 60 age bracket and 1 or 1% belongs to 60 and above age bracket who was already planning to retire from the service as a professional teacher.

Foronda (2010) asserted that old persons were being "tapped as resource persons to provide transfer of technology and new skills acquired by virtue of their training, tutorial consultancy services, actual teaching and demonstration of income-generating skills and lectures in specialized fields"

An aged teacher-respondent revealed that he is intentionally not pursuing his studies because he has no money. He prefers to save his salary for his son and daughter who are studying in college.

Sex of respondents. Majority or 84 (84%) of the teacher-respondents were female and only 15 or 16% were male teachers. The female teachers were more numerous than the male teachers in Infanta District. According to Carney (2007) as cited by Abuel (2013), the number of male teachers in Public Education is low. She posited that teaching little kids is a responsibility for women. It is domestic; it is tied to the home. On the other hand, according to Acker (1994) on " Gendered Education: Sociological Reflections" on women feminism, one common reason is that teachers take over the mother function as loving, caring, and understanding persons. Lau and Shani (2010) claimed that by disposition and mood, male workers tended to be better than female workers in team activity.

Civil status. Table 5 shows that 27 or 29% of the teachers are single while 64 or 69% are married. According to Abuel (2013), once a person is hired in a public school with all the benefits and privileges given to a government employee, he/she is assured of a stable job. This may be the primary reason why majority of the teachers is married. As cited by the above-mentioned researcher in answer to the question, "What do Social Scientist Know about the Benefits of Marriage" - marriage is positively associated with better and stable earnings for adult people. In other words, once individuals have acquired a stable job, they seek for a good marriage which is associated with stable income.

Stuafer (2008) asserted that married workers were more emotional in doing work than their single counterparts. He further added that single workers were more inclined to passive leisure times.

Highest educational degree earned. There are 33 or 36% who have earned a Bachelor's degree (BEED/BSED). This is followed by forty five (45) or 48% BEED/BSED teachers who have Master's Degree units. Fourteen (14) teachers or 15% are Master's Degree holders. Only one (1) teacher or 1% has Doctoral units.

De Vega (2010) asserted that the level of educational attainment of an individual should be raised to make him/her an effective participant in the national undertaking for progress. Bertland further stressed that the completion of a college degree was associated with estimated averaging and increasing an earning power.

It is very interesting to note that teachers from Kinder to Grade two, Grade 7 and Grade 8 are all Education graduates. One respondent shared, "Teaching will be easier if a teacher is a graduate of education because he/she has learned strategies/techniques and concepts in his

undergraduate studies/courses unlike a teacher who just earned professional education units. He still has to cope with the lesson on teaching strategies and techniques".

As presented above, among the 93 teacher-respondents, 45 of them or 48% earned MA units. Some teacher-respondents commented, *"Studying/earning units in graduate studies is not only an instrument for promotion but also for self-fulfillment. Once enrolled in a graduate studies program, many updates on trends in education will be acquired, also teachers will be upgraded of the contemporary teaching strategies which are useful and helpful."*

However, a senior teacher-respondent revealed, " He is intentionally not pursuing his studies because he has no money. He prefers to save his salary for his son and daughter who are studying in college".

Length/years of Service. It can be gleaned from the table above, that (64) teachers or 69% have rendered their services in the field of education for almost ten (10) years. This is due to the fact that they were newly hired as permanent teachers. Eighteen (18) or 19% have been in the service for 11 to 20 years while ten (10) or 11% for 21 to 30 years. Only one (1) teacher or 1% is planning to retire soon from the service due to old age. According to the International Journal of Social Economics as cited by Abuel (2013), the workers' length of service is related with their level of job satisfaction.

According to Beat, et. Al. (2010), experienced individual workers are likely to achieve success in solving problems they handle in any situation than the inexperienced ones. Gonzales emphasized that working conditions prepare education not only of the mind but of the entire person.

Some experienced teacher-respondents shared "A lengthy experience in teaching is great. Age in teaching shows respect. Teacher is more equipped with ways on how to manage the whole class, can easily address disciplinary problems among students and can share a lot of things about the lessons/experiences that are helpful to the students".

Lesson preparation. Twenty six (26) or 28% prepare their lessons once while there were four (4) or 12% with two preparations. Nine (9) teachers or 10% have three lesson preparations; one (1) teacher prepares four times. On the other hand, forty six (46) or 49% have five (5) preparations of lessons.

Some kindergarten and elementary teachers revealed, "Difficulties preparing the lessons under seven areas hinder them to execute the lessons well".

Number of Trainings on Area of Specialization. It can be gleaned from the table that there were 57 teachers or 61% who attended trainings on the area of their specialization at least five times. Twenty five (25) or 27% attended for at least 10 times and only eleven (11) or 12% attended trainings 15 times.

Trainings on K+12. The table above shows that eighty seven (87) teachers or 94% attended trainings on K+12 for at least 5 times and only six (6) teachers 0r 6% 6 and above were able to have trainings related to K+12.

According to Fulmin and Franklin (2010), working many hours resulted to the inefficiency of an individual and affected even his family life. They also pointed out that a person must have a full knowledge about the program he/she is working for because the clientele rely much on him/her for information. Teacher-respondents commented, "Seminars, trainings, workshops are of great help for them. They help teachers grow professionally and to be aware of the latest innovations in teaching".

Teacher Preparation

The average mean score, 3.76 which is verbally interpreted as "Often" denotes that the teachers are prepared/ready to discuss the subject matters before delivery in the class.

Item 9 ranked first with a mean of 4.24, verbally interpreted as "Often", pertains to reviewing of all the subject matters before delivery. "Assesses student performance through varied tools" ranked second with a mean of 4.12, and Item 3 "Prepares all needed materials first before starting the lesson proper" with a mean of 3.99 are both verbally interpreted "Often". These first-three ranked items are closely related with one another. The teachers are aware that reviewing all the subject matters and preparing and designing all needed materials first before delivery or starting the lesson proper affect teaching effectiveness. Assessment of student performance through varied tools serves as a basis of effective learning. The last ranked item with a mean of 3.24, verbally interpreted as "Sometimes" pertains to consultation with experts on the proper implementation of K+12 which reveals that teachers lack an in-depth understanding why K+12 curriculum was implemented.

In summary, there are eight (8) items which are verbally interpreted as "Often" and two (2) items, "Sometimes".

The findings revealed that the teachers in the public schools in the Division of Quezon, District of Infanta were prepared in the implementation of K+12 curriculum, as indicated by the overall mean

score of 3.76, verbally interpreted as " Often". This shows that the teachers always practice preparing, designing and reviewing the lessons, collecting a variety of materials for instruction, and soliciting support and feedback from other K+12 teachers but lack dialogues and updates about K+12 from experts and school heads.

Many of the teacher-respondents gave the following comments:

> "Once we go to the class we make sure that we mastered our lessons because there are smart students who will ask and test you whether you have the full knowledge about the topic. We prepared necessary materials needed in teaching so that there will be a better learning at the end of the period".

Curriculum Enhancement

The average mean score, 3.46 which is verbally interpreted as "Often" denotes that the teachers are doing some adjustments/enhancements with the prescribed curriculum to make it easier for the learners to understand the topics.

Item number four (4) ranked first with a mean of 4. 18, verbally interpreted as "Often", pertains to simplifying of the content to suit to the level of the learners. Item number 6 "Creates situations that enable the students to develop communication skills" ranked second with a mean of 4.02, and Items number 1 "Revises the content to suit to learner needs as needed" and number 8 "Designs activities that develop student creativity and flexibility" with a mean of 3.98 and are both interpreted as "Often". These first-four ranked items are closely related with one another. The teachers need to be mindful that making and revising the curriculum to make the content simpler and designing and creating situations and activities that enable the learners develop communication skills, creativity and flexibility facilitate the teaching-learning process.

Item number ten (10) ranked last with a mean of 3.28 which is "Integrates relevant scholarly works and ideas as needed", verbally interpreted as "Sometimes". This finding revealed that teachers were not engaged in the integration of relevant scholarly works and ideas. A response "Sometimes" shows that teachers lack the interest in doing researches. It may also mean that the job itself hinders them to grow professionally and academically due to the reasons that they lack finance/s, too many reports and other tasks to be done as well as too many teaching preparations and the location of the station from the school. However, teachers whose work stations are a bit nearer show no interests to engage themselves in scholarly because they are not research-oriented.

In summary, majority of the items - nine (9) are verbally interpreted as "Often" while only one item, as "Sometimes". The findings revealed that the teachers in the Division of Quezon, District of Infanta are generally showing good practices in " Curriculum Enhancement" in terms of enhancing the contents and designing all the needed and appropriate materials to develop and create situations that will boost students' creative and critical skills.

Some respondents explained:

> " There are certain instances that we do not follow the prescribed lessons or modules because they are difficult on the part of the students, instead, we simplify and revise them to suit the level of their understanding".

Teaching Strategies and Techniques

The average mean score, 3. 46 which is interpreted as "Sometimes" denotes that the teachers occasionally employ varied teaching strategies to address different learners in different levels. Item number ten (10) ranked first with a mean of 4.02 verbally interpreted as "Often" refers to using varied assessment tools to rate student performance. Item number eight (8) "Explores the use of varied teaching strategies in teaching" with a mean of 3.92 ranked second (2nd). Item number seven (7), "Uses student-based knowledge on subject matter as spring board for discussion", with a mean 3.87 ranked third (3rd).

This means that teachers need to employ varied assessment tools to determine which skills need to be developed more. Also, the teachers need to be properly guided of appropriate teaching strategies to be used on the next discussion. Activating/using student-based knowledge on subject matter as spring board for discussion helps the teacher identify how the students went through and how farther they can go through. Through this, teachers can design activities suited to the learners. In terms of teaching strategies, teachers have to be equipped with varied teaching strategies so that they can address and develop the learners' creative and critical thinking skills.

Item number five (5) ranked last with a mean of 2. 29, which is "Invites resource speakers to share expertise in the subject matter", verbally interpreted "Rarely". This finding reveals that the teachers rarely considered the community to be outlets of learning. This statement "rarely" denotes that community human resources are not tapped to share expertise to a subject matter they are proficient of.

In summary, there are six (6) items which are verbally interpreted as "Often" and four (4) items, "Sometimes".

The findings revealed that teachers in public schools in the Division of Quezon, District of Infanta were not totally equipped with varied teaching strategies and techniques. As indicated by

the overall mean score, 3.46, verbally interpreted, as "Sometimes". This displays that teachers from the Division of Quezon district of Infanta lack in-service trainings/seminars on teaching strategies and techniques. Aside from that, the community has not been invited as channels of learning.

Some of the teacher-respondents shared:

"It is an advantage for the teachers who always attend and undergo training, seminars, and workshops. These help them to be aware of different problems that our educational system faces now. Training help them address the problem. These also equip teachers with the knowledge to design lessons suited to the levels of the learners".

Learning Resource

The average mean score, 2.54 which is interpreted as "Sometimes" indicates that the teachers experience a shortage of the learning resources to be used in class. Item number ten (10) ranked first with a mean of 3.08, verbally interpreted as "Sometimes" pertains to providing numerous project materials and books. Item number three (3) "Provides 1:1 ratio of textbooks in every subject", with a mean of 2.95 ranked second (2nd). Item number nine (9), "Uses books and other references in the community library" with a mean of 2.86 ranked third (3rd).

This means that the three (3) items are closely related. Teachers must provide all the necessary learning materials, modules and other related references present in the school and community library. Materials of instruction refer to the various resources available to the teachers and learners which help instruction and learning. These represent elements found in the environment and which are meant to help students understand and explain reality. They serve as stimuli in the teaching-learning situation.

Item number five (5) ranked last with a mean of 1. 90, which is "Exposes the students to the community through excursion/fieldtrip at least once in a school year", which is verbally interpreted as "Rarely".

This finding revealed that teachers rarely expose the students to reality. This result "rarely" denotes that the teachers do not directly consider the community as a resource of student learning. One which is closest to reality is the direct, purposive experience where the learner makes use of practically all five senses in establishing contact with true-to-life objects, artifacts, views, sounds. This is sometimes referred to as experiential learning where learners acquire knowledge about particular situations, events, through experiences. An educational fieldtrip provides a type of learning obtained from real-life situations. This above-mentioned type of learning is an outlet that teachers failed to provide.

In summary, there are five (5) items which are verbally interpreted as "Sometimes" and five (5) item, "Rarely". The findings revealed that teachers in public schools in the Division of Quezon, District of Infanta experienced shortage of learning materials, modules and other related references used in the teaching-learning process as indicated by the overall mean score of 2.54, verbally interpreted as "Sometimes".

All these provide an immediate and first-hand learning laboratory in which learners may participate in a wide variety of experiences that are significant to them.

Some of the respondents shared:

"Learning materials are really problems in our stations. We have a school library but the books stored there are not useful, they are out-dated, so we let the students reproduce the texts but it is a burden on their part".

Student Preparation

Table 6 presents the mean scores, ranks and verbal interpretations of the items on student preparation/readiness. The average mean score, 3.62 which is interpreted as "Often" indicates that the teachers react, orient and explain to students the K+12 curriculum.

Item number ten (10) ranked first with a mean of 3.83 verbally interpreted as "Often" pertains to the orientation of the students on different class activities. Item number seven (7) "Explains clearly the objectives of K+12" with a mean of 3.76 ranked second (2nd). Item number nine (9), "Demonstrates new ways on how the lessons are presented" with a mean of 3.72 ranked third (3rd).

This means that teachers orient the students on different class activities wherein students' communication, creative and critical thinking skills are enhanced. This relates with item number seven (7), if the students' communication, creative and critical thinking skills will be developed, graduates of K+12 will be qualified to any field of work and will easily compete with the other graduates of other countries. This is related to the objectives of the K+12 curriculum.

Item number four (4) ranked last with a mean of 3. 29, which is "Discusses to the students the rationale why the enhanced basic education curriculum needs to be implemented." which is verbally interpreted as "Sometimes".

This finding reveals that teachers have to discuss from time to time the rationale why the K+12 was implemented. Students have to be aware that based on DepEd findings as cited by Poliquit, the Philippines has not yet met the standards required of students to compete on an international level. Our country ranked the lowest in Math and Science in the international level of the 2003 TIMSS (Trends in International Mathematics and Science

Study). The low achievement scores of the Filipino students can be attributed to poor quality education in our schools more specifically because the current basic education designed as-a 12-year curriculum is delivered in 10 years.

In summary, there are eight (8) items which are verbally interpreted as "Often" and two (2) items, "Sometimes".

The findings reveal that teachers in public schools in the Division of Quezon, District of Infanta engaged, oriented and demonstrated new ways on how the activities and lessons are presented. On the contrary, teachers have to constantly explain the logic of implementing the K+12 curriculum so that every student will be aware that graduates are not automatically recognized professionals abroad. The Philippines is the only country in Asia and among the three remaining countries in the world that has a 10-year basic education program. International universities and professions call for a 12-year education program. Add the fact that shorter schooling breed younger graduates, most of whom are younger than the legal limit of 18 to enter the workforce and arguably not as emotionally prepared for the demands that higher education, employment and entrepreneurship call for.

Some of the teacher-respondents shared:
"I always explain to my students the rationale why the K+12 curriculum needs to be implemented. I discuss the goals, purposes, objectives and benefits they can get from the curriculum. This helps them to be aware of the program of our educational system".

Teacher Practices in the Initial Implementation of K-12 Curriculum

The Data show that the 20 Highest Ranked Items on Practices in the initial implementation of the K+12 Curriculum in Infanta, Quezon. The above-mentioned ranking is based on the five categories of teachers' best practices in teaching.

Among the practices, "Reviews all subject matters first before delivery" under the area of teacher preparation with a mean score of 4.24 ranked first (1). Ranked second (2nd) under curriculum enhancement with a mean score 4.18 is "Simplifies content to suit the level of learners." "Assesses student performance through varied tools" with a mean score of 4.12 under teacher preparation ranked third (3rd).

Reviewing the subject matters first before delivery is considered as one of the best practices of teachers in Infanta District Division of Quezon. This category revealed that the students' level of thinking is highly considered to determine as to whether teachers need to make necessary adjustments to suit the levels of the learners.

Another category "Simplifies content to suit the level of learners" is taken into consideration as best practice of teachers in the Infanta District. Teachers observed that when the K+12 curriculum was initially implemented many of the lessons were not really fitted to the level of understanding of the students. Hence, enhancement/simplification of the contents to suit the level of learners was done.

"Assesses student performance through varied tools" is an area that is always employed by the teachers in the Infanta District. Knowing the results of assessments gives the teachers ideas whether they will improve teaching or they need to proceed to the next subject matter.

"Commences discussion of lessons with what students already know" with a mean score of 3.74 under teacher preparation ranked last. The above-mentioned category is the least practiced by the teachers from the Infanta District Province of Quezon. This means that the learners and the contents are the focus of the teaching-learning process.

In summary, there are eight (8) items on curriculum enhancement, 6 items on teacher preparation, 4 items on teaching strategies and techniques, two items on student preparation while no items on learning resources. In particular, the following are the teachers' best practices in the initial implementation of the K+12 curriculum: reviews all subject matters before delivery (teacher preparation), simplifies content to suit the level of learners (curriculum enhancement), Assesses student performance through varied tools (teacher preparation), uses varied assessment tools to rate student performance (teaching strategies and techniques), and creates situations that enable the students to develop communication skills (curriculum enhancement).

Problems in the initial implementation of K+12

The average mean score, 2. 60 which is interpreted as "Moderately a Problem" indicates that the teachers moderately experienced a problem when it comes to preparation/readiness. Item number one (1) ranked first with a mean of 3.17 verbally interpreted as "Moderately a Problem" refers to inadequacy of seminars/trainings and other related readings on K+12. Item number two (2) "Insufficient readings and study materials on K+12" with a mean of 3.14 ranked second (2nd). Item number three (3), "Lack of knowledge, skills, attitudes, values pertinent to K+12" and "Inadequate knowhow on the use of varied assessment tools" with a mean 2.58 both ranked third (3rd).

Item number seven (7) ranked last with a mean of 2. 28, which is "Lacks mastery on teaching

content and objectives", verbally interpreted "Slightly a Problem".

This means that teachers lack an orientation why the K+12 curriculum was implemented. Absence of proper orientation, insufficient readings and study materials and lack of knowledge, skills, attitudes, values pertinent to K+12 are some of the problems encountered by the teachers.

In summary, there are six (6) items which are verbally interpreted as "Moderately a Problem" and two (4) items, "Slighty a Problem".

The findings revealed that teachers in public schools in the Division of Quezon, District of Infanta are in need of trainings/seminars on teaching strategies and techniques related to K+12. Trainings and seminars aim to equip every teacher with contemporary teaching strategies to be used in classroom discussion. In teaching to be able to give children quality learning, varied teaching strategies and techniques are necessary. These inspire pupils to learn more. This is based on the concept that education is a preparation for adult life, mental discipline, transfer training, acquire knowledge for its sake, seeking truth and perception, and habit formati0n.

Some teacher-respondents shared:
"In the first year of the implementation of the curriculum, we made necessary adjustments. Everything is new to us; the lessons and activities even the designs on how to attack the lessons are totally different. We are confused of what strategy to use. We lack training on constructivist approaches. The curriculum is more on employing the constructivist methods."

Interpretation of items on problems on teacher preparation/readiness.

The average mean score, 2.75 which is interpreted as "Moderately a Problem" indicates that the teachers experienced moderate problems in terms of enhancement of the curriculum.

Among the ten (10) items on problems on curriculum enhancement, item number three (3) ranked first (1st) and got the highest mean score, 3.00, verbally interpreted as "Moderately a Problem" refers to integration of the resources and needs of the community is not evident in the curriculum. Item number six (6), "Project-based learning activities have not been carefully planned" with a mean of 2.97 ranked second (2nd) while item number seven (7), "Revision as needed to make content relevant has not been given attention" with a mean of 2.93 ranked third (3rd).

This result showed that teachers are not experts in revising the content as well as planning and designing activities that employ project-based learning or constructivist approaches. They lack the ability in designing lessons using project-based learning (PBL). PBL as described by Markham (2011) "integrates knowing and doing. Students learn knowledge and elements of the core curriculum, but also apply what they know to solve authentic problems and produce results that matter. PBL students take advantage of digital tools to produce high quality, collaborative products. PBL refocuses education on the student, not the curriculum--a shift mandated by the global world, which rewards intangible assets such as drive, passion, creativity, empathy, and resiliency. These cannot be taught out of a textbook, but must be activated through experience."

On the other hand, as revealed in Item number nine (9) ranked last with a mean score of 2.30, verbally interpreted as "Slightly a Problem" means that teachers do enhancement of the subject matter. They consider the level of students. It means, if topics/activities were difficult for the students to understand, necessary revisions were made.

The above-mentioned finding was supported by a teacher-respondent's statement on open-ended question number four (4), "Content enhancement, researches, and readings were made to get ideas on how to design lessons/activities to catch the students' interest".

This finding revealed that the teachers in the Division of Quezon, District of Infanta were adequately knowledgeable when it comes to curriculum enhancement. They possess the ability on how to modify the prescribed curriculum for easy understanding. On the other hand, they lack knowhow on how to engage constructivist approaches which require the students to learn as they work on their own.

Further, the findings manifest that the DepEd is wanting in the conduct of regular trainings/seminars which focus on designing plans/activities in line with the constructivist theory. Since, K+12 aims to equip every K+12 graduate with the necessary knowledge, skills, attitudes, and values, they will be taught of the above-mentioned characteristics from Kinder to High School. There will be a better senior high school implementation. Through this, they will be able to meet the standard of education which is to be competent graduates, competent and productive in the world of work.

Some respondents expressed:
"Our students are not exposed to the community. They are rarely engaged to field trips especially in the elementary level, because of the financial incapability of the parents/ learners. Even a single penny to have a copy of the materials needed for

discussion is a burden to them, how much more if they will spend on transportation for field trips".

Teaching Strategies

The average mean score, 2.87, interpreted as "Moderately a Problem" indicates that the teachers experienced moderate problems in terms of employing teaching strategies and techniques in teaching.

Out of the 10 items, item number three (3) "Lack of technology assisted-instruction" ranked first. This finding revealed that teachers lack the ability in using appropriate materials for a technology-assisted instruction. The answer "moderately a problem" proves that teachers only occasionally used technology and other ICT-related materials in teaching.

The finding was supported by the response of the teacher-respondents in open-ended-question number 4. According to the teacher-respondents, "Technology and other ICT-related materials needed for instruction become problems in teaching because we ourselves do not have the ability to operate computers. There are also no enough facilities and ICT- related materials that can be used in teaching in our stations. They also shared that students are not inclined to operating computers so they prefer not to use such in teaching"

Item number six (6) "Resources of the community are meager for student exposure" ranked first with a mean of 3.21 which is verbally interpreted as "Moderately a Problem". Item number seven (7) "No qualified or available resource speaker to share expertise on the subject matter", with a mean of 3.06 ranked second (2nd). These two items are closely related as both refer to community resources. These resources can be places or persons. Students can acquire authentic learning if they go on excursions/fieldtrips. Fieldtrips are more than a "vacation" from school. Coupled with meaningful and relevant lesson objectives, a field experience can engage students in learning and leave a lasting imprint. The experience is very useful because it engages most of Gardner's multiple intelligences, including the naturalist bodily-kinesthetic, interpersonal, verbal-linguistic, intrapersonal, visual-spatial and logical-mathematical. Teachers who routinely integrate multiple intelligences into their lessons and assessments engage the different types of learners, making the learning process successful for all.

There is no question that every fieldtrip or experience requires more time and coordination, especially on the part of the instructor. But the benefits far outweigh the challenges. Students gain meaningful, hands-on experiences directly tied to course objectives and content standards. The best part of a well-organized field experience is that students will remember the "whats" and "whys" even after the class has ended.

Some of the respondents explained:
"In our station, supplies of computers are very inadequate. It will be helpful if we have more of them, so that the needs of digitally-native learners will be addressed".

Problems on Learning Resources.

The average mean score, 3.34 which is interpreted as "Moderately a Problem" indicates that the teachers experienced moderate problems in terms of providing enough learning materials. Three out of ten items on problems in terms of learning resources got a verbal interpretation, "Much of a Problem". Item number three (3), "No available modules in the subjects" ranked first (1) with a mean score of 3.76 while item number six (6) "Few reference materials are found in the school library" ranked second with a mean score, 3.52, verbally interpreted as "Much of a Problem". Item number nine (9), "Limited numbers of books and references are found in the community library" ranked third (3rd) with a mean score of 3.5 and verbally interpreted as "Much of a Problem".

These three items are closely related with each other. All pertains to inadequacy of learning modules, books, and other references. The result, "Much a Problem" revealed that learning materials were not provided for when the Enhanced Basic Education Curriculum was initially implemented.

This finding relates with the answers of the teacher-respondents wherein they listed that the most pressing problem they encountered when K+12 was initially implemented was the absence/lack of learning materials. If there were materials provided, only the teachers owned a single copy of them and the contents were good for the second quarter only.

Among the items on problems in learning resources, item number five (5) inadequate community resources as an aid of student learning ranked last with a mean score, 3.07, verbally interpreted as "Moderately a Problem". This means that the community can only be considered as a secondary source of learning.

In summary, among the five (5) areas on problems when K+12 curriculum was initially implemented, lack of learning resources became the major problem of the teachers of the Division of Quezon, District of Infanta. Learning materials according to Jocelyn Right (2014) are the resources teachers use to deliver instruction. Teaching materials can support student learning and increase student success. Ideally, the teaching materials are tailored to the content in which these are used, to

the students in whose class these are used, and the teacher. Teaching materials come in many shapes and sizes, but they all have in common the ability to support student learning.

On the other hand, teachers learned to be resourceful in reproducing the learning materials.

Some of the respondents shared:

"Learning materials are a big problem, no available modules, books and other references to be used. We only use the old references available in the library".

Problems on Student Preparation/Readiness

The average mean score, 2.97 which is interpreted as "Moderately a Problem" indicates that students were inadequately prepared with the enhanced curriculum. Three out of ten items on problem in terms of student preparation mainly focused on problems that explain and orient the students on the rationale, goals, purposes, and objectives of the K+12 curriculum. Item number two (2), "Lacks orientation, symposium to broaden the knowledge on K+12" ranked first (1st) with a mean score of 3.28 and verbally interpreted as "Moderately a Problem". Item number three (3), "Lacks knowledge on the rationale on the implementation of the enhanced basic education curriculum", ranked second with a mean score, 3.19, verbally interpreted as "Moderately a Problem". Item number one (1) "Poor awareness on the goals, purposes and objectives of the K+12 curriculum ", ranked third (3rd) with a mean score of 3.09 and verbally interpreted as "Moderately a Problem".

These three items are closely related with each other. All of them pertains to the poor orientation and explanation to the learners of the rationale, goals, purposes and objectives why the curriculum was implemented. The result, "Moderately a Problem" revealed that they are unaware of the benefits they will acquire after graduating under the enhanced curriculum.

In summary, among the five (5) areas on problems met by teachers when the K+12 curriculum was implemented, student preparation/readiness ranked second (2). On the whole, schools through school heads and teachers failed to conduct regular symposia/proper orientations to students, parents, stakeholders about the K+12 curriculum.

Some of the teacher-respondents explained:

"Orientation and explanation done by teachers and school heads before the scheduled of classes are not enough. There must be experts to be invited to share expertise about the curriculum".

Problems on implementing the k+12 curriculum

"No available modules in the subjects" with a mean score of 3.74 ranked first (1st). "Few reference materials are found in the school library" with a mean score of 3.52 ranked second (2nd). "Limited numbers of books and references are found in the community library." with a mean score of 3.51 ranked third (3rd).

Absence of learning materials (books, modules and other references) became the major problems of the teachers from the Infanta District Province of Quezon. The above-mentioned problems were supported by the answers of the teacher-respondents in the open-ended questions.

"Lack of understanding on concepts and class activities" with a mean score of 3.02 ranked last. This means that teachers from the District of Infanta Province of Quezon possess some knowledge on how to enhance the curriculum or the contents for the learners to fully understand the subject matters.

Out of the 20 highest ranked items on problems on the initial implementation of the K+12 program, 10 are on learning resources, five (5) on student preparation/readiness, three (3) on teaching strategies and techniques and two (2) on student preparation/readiness while zero (0) for curriculum enhancement. Therefore, the most pressing problems of the teachers in the District of Infanta Province of Quezon are on learning resources followed by student preparation/readiness. In Particular, the most pressing problems of the teachers in the initial implementation of the K+12 program are: no available modules in the subjects, few reference materials are found in the school library, limited numbers of books and references are found in the community library, few available materials for projects and research work, and absence of resource persons to give further discussion/talk about specific topics.

Correlation Of Practices And Problems In The Initial Implementation Of K+12

The correlation between the teachers' practices and their problems relating to the initial implementation of the K+12 curriculum is presented in Table 18.

From data analysis known that the computed coefficient of correlation, .55, with a verbal interpretation of marked substantial relationship, reveals that the practices relate with the problems of the teachers in the Division of Quezon, District of Infanta, in the initial implementation of the K+12 Curriculum. This signifies that their practices positively relate with their problems. To determine whether the coefficient of correlation obtained is significant, the t-ratio was computed. The obtained t-ratio was 6.55 which registered significance at the .01 level. This shows that there is a significant relationship between the practices and problems

encountered by the teachers in the initial implementation of the K+12 Program. Therefore, the null hypothesis which states that 'there is no significant relationship between the teachers' practices and problems in the initial implementation of the K+12 Curriculum' is rejected.

Correlating the practices in teaching with the problems they encountered when the K+12 was initially implemented, the relationship obtained was significant. In others words, while the teachers were found to be consistent in employing certain practices in teaching or good in their performance, the problems they encountered hindered them in delivering excellent outcomes. Students' educational achievement as cited by national and international tests and competitions were very low; far from the international mean score or the standard passing rate which is 75 percent as prescribed by the Department of Education.

Through this very alarming scenario in our educational system, to be able to achieve the ASEAN standards and to be able to compete with the international standards, the government through the help of three educational agencies: Commission on Higher Education, Department of Education, and Technical Education Skills Development Authority is currently doing educational reforms in the three identified educational levels. One priority and a very relevant initiative is outcomes-based education (OBE).

This concept revolutionizes the evaluation of teaching performance. Teachers will be withdrawn from the traditional ways of teaching; instead they will be focusing on the outputs or what students have learned. Here, their creative, critical, communication and problem-solving skills will be honed and developed; and their abilities to formulate solutions to the problems and projects which would make them to be contributing members of their communities and also the global community as whole are practiced. Truly, teachers play vital role in the community as reiterated by a former Secretary of Education "Be proud you are a teacher, the future depends on you".

Implications for an Effective Implementation of Senior High School
The last specific question asked in this investigation pertains to the implications derived from this study for an effective K+12 implementation. The following are the significant implications:

First, the findings that majority of the teacher-respondents are in the middle age and that many of them are female imply that they are experienced working with kids and are tied to the home. This implies that they are best substitutes to take the position of being second parents to elementary and secondary students. It is a fact that a school serves as second home for every learner, meaning each of them will be provided parental guidance when their parents cannot attend to them.

Second, the findings that majority of the teacher-respondents are young, as what has been mentioned in the first finding that majority of the teacher-respondents are at a young age, imply that they are active, dynamic, energetic, responsible and resourceful. This implies that they will be able to perform every assigned task to them mostly in teaching and in managing the class. Their ages can be considered in the prime level, thus they are more productive and proactive.

Third, the findings that most of the teacher-respondents are married. This finding shows that teachers and elementary and secondary levels imply that more parental care is involved. As a teacher, who pays attention to the students' needs would require deep passion for the children. He/She has to fully understand their attitudes, necessities and interests.

Fourth, the findings that all of the teacher-respondents hold a degree in education imply that they possess the necessary knowhow in child psychology, growth and development. The fact that they understand, know and apprehend one's uniqueness and differences, they can guide and teach them well.

Fifth, the findings that majority of the teacher-respondents hold BEED/BSED with MA units imply that they need to be encouraged to finish their master's degree. This implies they will be more research-oriented. Earning graduate studies degrees helps the teachers to be more competent in teaching in the subjects they are handling.

Sixth, the findings imply that teachers are in need of adequate trainings and seminars about the latest innovations in teaching, especially nowadays that students are more engaged in technology. In this manner, they will be equipped and be abreast of the latest strategies and methodologies in teaching.

Seventh, the findings that majority of the kindergarten and elementary teachers have five and above preparations. This implies that they are in need of teacher-assistants to address the large number of pupils and to do other school chores. Large number of pupils in the classroom and many lesson preparations hinder them to be effective teachers, thus, number of class size and lesson preparation must be reduced.

Eighth, the findings that most of the teacher-respondents utilize lesson planning. Teachers

review the subject matter before the delivery, prepare all the needed materials and assess the students through varied assessment tools. They also consult regularly with school heads and experts for updates in curriculum. This implies that good teaching ensures effective learning and good classroom management.

Ninth, the findings that many of the teacher-respondents simplify, design, and integrate the contents that will get the students' interests and will develop their creative, critical, communication and problem-solving skills. This implies that if these are practiced regularly there will be an effective teaching-learning process.

Tenth, the results that many of the teacher-respondents explore varied assessment tools and employ the uses of varied teaching strategies in teaching imply that strategies address the students with different levels. If these are always done, students will be developed holistically.

Eleventh, the findings that teacher-respondents find difficulties having a complete and enough numbers of learning resources. They are in need of materials and human resources. Materials imply that as an integral part of the teaching-learning situation, these help to bring about permanent and meaningful experiences.

Twelfth, the findings that most of the teacher-respondents come up with different class activities and motivate the students to engage in independent study imply that they establish real, concrete and explicit learning.

Thirteenth, the results that teacher-respondents lack seminars , trainings and readings related to the area of their specialization and of the K+12 curriculum imply that these hinder them to design lessons/activities prescribed in the newly implemented curriculum. This also implies the need for teachers to be familiar with the latest teaching strategies and techniques to create fun and engaging lessons.

Fourteenth, the findings that many teacher-respondents do not expose the learners to community resources, integration of the community as resources is not evident imply the needs of the students to be engaged to excursion/fieldtrips to make learning effective, direct and authentic.

Fifteenth, the findings that most of the teacher-respondents lack appropriate technology-assisted instruction and ICT-related materials, imply that teachers have to be equipped with knowledge and skills in manipulating such. This helps to catch the learners' interests especially nowadays that they are in the digital age. The more engagements to the resources, the more that learning occurs.

Sixteenth, the findings that many teacher-respondents need to be resourceful enough to address the scarcity of teaching materials imply that teachers must tap community members and materials in the local community which can be very good substitutes for what are needed to implement the curriculum. Some can be resource speakers. They can be interviewed. The whole community can serve as a curriculum resource thus each has a great stake in curriculum implementation.

CONCLUSIONS AND RECOMENDATION
Conclusions

Based on the findings of this study, the following conclusions are hereby drawn: (1) the teacher-respondents in the pre-elementary, elementary and secondary public schools in the Infanta District of Quezon are predominantly female and married, in their age bracket 31-40 years, have finished teacher education courses with licenses and civil service eligibilities and with graduate education units, have been teaching for 10 years; and have attended trainings on K+12 below 10 times.

(2) In the initial implementation of the K+12 Curriculum, the teachers were able to refine best practices in three areas of the five identified areas of concern. There were no identified best practices in learning resources as well as teaching strategies and techniques while the following are the top ten best practices in the areas of teacher preparation/readiness, curriculum enhancement, and student preparation/readiness: (a) reviews and ensures understanding of subject matter before delivery, (b) simplifies curriculum content to suit the level of learners, (c) measures student performance through varied assessment tools, (d) creates situations that enhance communication skills among students, (e) integrates learner nature and interests into subject matter, (f) prepares the needed materials before starting lesson proper, (g) designs activities that develop student creativity and flexibility, (h) explores the use of appropriate varied teaching strategies and techniques, (i) integrates with the lessons the culture, customs and traditions of the community, and (j) uses student base-knowledge on lesson as a springboard for discussion.

(3) The top ten most pressing problems encountered by the teachers in the initial implementation of the K+12 Curriculum are: (a) no available modules for use in the different subject areas, (b) very few books and other references are found in the school library, (c) very limited related reading materials are available in the community library, (d) very few available materials for projects and research work, (e) absence of resource persons

to enhance discussions on specific topics, (f) inadequate seminar-workshops/symposia to broaden knowledge on K+12, (g) lack of technology-assisted instructional materials, (h) insufficient computers and other IT equipment in aid of instruction, (i) community resources are meager for student exposure, and (j) lack of textbooks in the different subject areas.

(4) The practices of the teachers to bring about an effective implementation of the K+12 Curriculum significantly relate with the problems they encountered. The more practices they initiated, the lesser the problems they encountered or the other way around.

Recommendations

Based on the aforementioned findings and conclusions, the following are hereby recommended to the following: (1) Teachers; (a) participate in more seminar-workshops/ trainings on the K+12 curriculum and other K+12 related seminars and trainings to be able to effectively implement said curriculum considering in particular the skill in designing appropriate instructional modules and audio-visual materials as well as the use of varied assessment tools; (b) Through self-study and own initiatives, master the competencies and skills in enhancing the curriculum to fit the nature, needs and interests of the learners as well as the needs of the industry and the community thus making the curriculum relevant and responsive for purposes of mitigating the problem on mismatch; (c) learn to indigenize and localize the curriculum in order to maximize the use of community resources for student projects and research work as well as to make the curriculum appropriate in addressing community needs; (d) explore and establish linkages with different sectors in the community as well as other educational institutions, business establishments and agencies to act as partners in the effective implementation of the K+12 curriculum; (e) make a survey on community resources and needs or an environmental scan to get the necessary and appropriate information in contextualizing or enriching the curriculum; (f) partner closely and harmoniously with the students' parents to solicit their all-out support in effecting an effective K+12 curriculum implementation; (g) step-up the student orientation campaign regarding the K+12 curriculum for them to fully understand its rationale, objectives and importance.

(2) *Heads of Schools;* (a) sponsor more in-house K+12 seminars and trainings or provide budget for them to attend such activities off-campus for purposes of a heightened understanding on the K+12 curriculum; (b) regularly mentor and monitor teachers on how the K+12 curriculum should be properly implemented and evaluate to cite and reward functional practices, address problems or eradicate undesirable practices in the implementation; (c) create a dynamic home-community-school partnership to collaboratively advance the objectives of the K+12 curriculum; (d) Allot adequate budget for the purchase of K+12 books and other reference materials, modules and IT equipment in aid of instruction; (e) track the progress and evaluate the implementation of the K+12 curriculum as a basis or groundwork for the forthcoming implementation of Senior High School.

(3) *Students;* (a) strive to understand and to fully embrace the rationale and objectives of the K+12 curriculum by being focused during information drives especially organized for them; (b) cooperate with their teachers in the attainment of the objectives of their daily lessons.

(4) *Parents*; (a) attend K+12 forums/symposia to fully understand the need and benefits of the K+12 curriculum; (b) provide for and assist their children in the accomplishment of their school projects and research work as well as assist them in their reviews for major examinations; (c) partner with the school in providing the best quality of education for their children.

(5) *District Supervisor*; (a) conducts regular visits to the schools to provide the necessary assistance in the effective implementation of the K+12 curriculum

(6) *Department of Education*; (a) make a survey on the needs and problems of the schools relative to the implementation of the K+12 curriculum and promptly offer corresponding appropriate solutions; (b) provide follow-up K+12 seminar-workshops/trainings to teachers geared at an effective K+12 implementation; (c) provide to all schools the necessary building and laboratory facilities as well as learning resources required; (d) track and evaluate the initial implementation of the K+12 curriculum for purposes of immediately addressing any problem or difficulty encountered; (e) make use of the findings of this study as a basis or groundwork in bringing forth an effective implementation of the Senior High School Program.

DEVELOPMENT MODEL IN ISLAMIC EDUCATION THROUGH SOCIAL PROBLEM STRATEGY TO FORM STUDENT'S SOCIAL INTELLIGENCE

Lilik Nur Kholidah
State University of Malang,
e-mail: lkholidah@yahoo.com

ABSTRACT

Character education through Islamic education learning is a strategical effort to develop the quality of Indonesian human resources. An enhancement on character value in higher education institutions can be performed by implementing a social-problem-based Islamic education. Islamic education based on social problem is expected to be able to develop student's social intelligence. This research aims to develop a package of Islamic education based on social problem as a way to develop student's social intelligence. The result shows that (1) the result of substance exploration study upon social intelligence component being developed in Islamic education based on social problems highlights the awareness of self and others situational, empathy competence and communication competence. (2) the developed educational package is reasonable and can be utilized as educational package. There are 75% people that validates ("validation persons") who assessed the package as 'very valid' and the rest 25% assessed it as 'valid'. (3) Islamic education package based on social problem can enhance student's social intelligence.

Keywords: *development, project-based learning model, learning media, learning outcomes*

Character development through education is a strategical effort to advance our nation. Human resources quality of a nation is determined by educational process, one of the way is through character education. Reorganization of character education, in higher education curriculum structure, can be performed by, one of the way, implementing an education that emphasizes on the process of student's character development.

College as a higher education institution is obliged to develop characters of the students, whether in academic field or non-academic field as well as spreading out science and knowledge for the sake of society advancement. In order to spread out science and technology, students are liable not only to master academic competence, but also the competence to establish social interaction.

In social life, the basic value of social interaction competence is an essential value that needs to be developed in educational process, considering that human beings are dignified creatures. The basic value of this social responsibility cannot be obtained from social environment, individual or communal interactions. The interaction being performed is marked by the existence of concern for others, kindness for each other and love. Hence, the embedded process is considered as an important matter in establishing the awareness of teaching subjects upon their social life.

Social intelligence may occur in the form of entire parts of the development of one's competence that is utilized for interacting or connecting effectively to others. Specifically, the referred social intelligence may come up in the form of competence in performing interaction with others and in understanding others.

In the structure of Indonesian higher education curriculum, Islamic education holds an important role in transforming values which based on Islamic dogma to form student's personality with character. Through the lecturing of Islamic education, it is expected for the lecturing to be able to form student's character to be the one with interpersonal competence in building interaction with their social environment that is referred as social intelligence.

In the context of Islamic education learning which contains norms value, the activities for social intelligence development including development of substances, process and arousing atmosphere or environment that support the students to improve their well behaviors in their daily life. Learning experience is directed on the development of learning interaction atmosphere that is designed to achieve the goals of social intelligent character forming, by conditioning learning situation and condition that sought after the students so that they will be accustomed to behaving according to norms value and social intelligence character.

Islamic education based on social problem emphasizes on social problem as the basic analysis. Hence, it is expected that the transformation of Islamic dogma values will be dynamic and can provide appropriate response toward the problems that occur in society.

Islamic education based on social problem, in this case, is different from the conventional Islamic education, as provided in the table below.

No	Conventional Islamic Ed	Social-problem-based Islamic Ed
1	Based on belief (doctrine)	Putting social problem as the basic.
2	Using exclusive paradigm	Using inclusive paradigm.
3	Orientating on the mastery of theology and religious rituals	Orientating on religious norms and ethics to form social behavior and social problem solving
4	Curriculum based on religious knowledge	Curriculum based on social reality
5	Religious norms become learning materials for the students to memorize and understand	Religious norms are embedded to the students as the base for them to behave and act in society
6	Students are charged to master religious knowledge	Students are guided to be religious agents in social development

Table 1. Differences of conventional and social-problem-based Islamic education implementation (Sutrisno, 2012).

Ability to analyze social problem becomes a tool to form student's social intelligence. By problem solving skill, the students will get not only knowledge but also the competence in utilizing all of their obtained knowledge to overcome new situation or to solve the problems related to real life. Application of whole knowledge in social life problem solving will enhance student's competence in overcoming life reality and their skill in solving problems. This problem solving skill, in social life context is considered as an effort to form a character on the students who have social intelligence.

Through problem solving, the student will be motivated to expose themselves in thinking process, obtaining learning experience directly by themselves. Ability in solving problems which is integrated with Islamic dogma value is important for the students in the future. Competences in Islamic value, in this case, are assessed by positioning student's understanding upon values exposed to various problems that occur in social life.

The specific goals of this research are to describe the substance of Islamic education materials based o social problem as an effort in developing student's social intelligence, to

describe that the educational package being developed can be implemented. Meanwhile, the urgency (advantage) of this research is to generate a package of Islamic education that may form student's social intelligence.

METHOD

This study is categorized as a *Research and Development (R&D)*study. Research procedures employed in this study adopted research procedures proposed by Carey (2005). Research Step I utilized developmental research design (Carey, 2005). The main target of this research is to arrange model prototype of Islamic education based on social problems. Hence, a survey on (1) theoretical concept of material substance on Islamic education based on social problem was needed. This survey was utilized as a material to arrange the model prototype. Product design. Manifested in the form of educational package development. Design validation was conducted by expert lecturers education/teaching design, material experts. Design revision. Validation result was done for the remedial of educational package and Revision of product after the research result was analyzed and performed through *Focus Group Discussion (FGD)*

The outcome of this research activity is the educational package that has been revised and been ready for try-out or implementation. This research took place on higher education institutions in *Malang Raya*. The subjects (respondents) of this research are Islamic Education Lecturers in *Malang Raya*.

RESULTS AND DISCUSION
Results
Components of social intelligence being developed in Islamic Education through Social Problem Strategy

Social intelligence as a competence of an individual in performing social interaction is related to the competence of an individual in establishing relationship with the environment or a group of society. In the context of social relation, social intelligence is the ability of an individual to contribute him/herself on his/her social surroundings, signified by the individual skills in positioning him/herself in social interaction, both in self-understanding and understanding-towards-others aspects.

This development on social intelligence may occur in the form of entire guidance from the one's competence which is utilized for interacting or communicating effectively with the others. Fundamental aspects in this social competence guidance may be implemented via materials delivery in learning programs that emphasize on the forming of social intelligence.

Self-Situational and Others-Situational Awareness

Situational skill upon one's self and others' selves is a well-managed skill in terms of interacting with others and scrupulously reading surrounding situation. The forming of this competence is started by understanding one's own emotion then dealing with others' emotion.

This social proficiency is an aspect that may support the succeed in mingling with others. The absence of this skill from ones' selves may result in the inability in dealing with social world. Indeed, due to the absence of these skills, people with such high academical value are mostly fail in maintaining their relationships (Goleman, 2002:158-159).

According to the research findings, lecturers deliver these situational comprehension upon one's own self and others' selves through the delivery of materials that shall lead students' awareness of their natural tendency as human in life.

Situational comprehension is directed on the transformation process of cognitive through the deliveries of concepts, facts, principles on the materials as quoted from the following interview

Discussion of contents of materials or subjects in Islamic Education (*"Pendidikan Agama Islam"* - PAI), such as : Human rights, Democracy in Islam, Ethics, morals, religious harmony, civil society and human prosperity, where these materials are more possibly to be an entry point to develop student's social intelligence.(REK WWCR-DS-S-UMM)

Moreover, those materials are elaborated on the discussion of the nature of life, social life, meaning of life, purposes of life and how existence and actualization from students as human beings who hold noble obligations to bring this universe into a better one go on.

Message transformation is delivered by integrating character value taught in Islamic education according to normative guidelines from *Al-Qur'an*. Moreover, it is also delivered through social life problem analysis.

Empathy Competence

Empathy is one of the important skills that needs to be developed in students' daily life. Empathy is also one of the important parts of social intelligence. It is closely related to other components such as basic empathy, harmony in empathic accuracy and social comprehension.

Empathy is understanding the feelings and problems of others and thinking from their point of views, appreciating the difference in others' feelings upon many things (Goleman,

2002:428). According to Goleman, the competence in sensing one's feeling before the corresponding subject say it in words is the main essence of empathy.

Empathic attitude in social interaction is essentially needed, because through this attitude, students will be able to read the social tendency of others and may result in positive attitude to always understand others' conditions. By possessing this empathic attitude, the students' will understand their friends better, and possess a high social attitude to their peer friends. The impact shows is that the learning and teaching process and relationship of individuals with others will be maintained better.

Batson et al. (1997) in their journal entitled *Information Function Of Empathic Emotion: Learning That We Value the Other's Welfare* conducted a research to identify the effect of empathy on the attitude which generated three steps of model, they are:

a. Performing a perspective view on somebody who are in a condition of needing some helps (for instance by imagining what they are feeling) will improve empathic *feeling* on those individuals

b. *Feeling* this empathy will bring towards a perception to improve individual condition

c. According to the assumption that individuals as the members of certain group who need helps, a positive assessment is generalized to the group as a whole, so that the one who empathize on a member of that particular group will make that group member will give the same empathetical response on the group as a whole.

Mercer and Reynolds (2002) stated that empathy may form climates between individuals free from defensive attitude and may result in the individuals to be able to talk more openly about their perception on their own needs.

Moreover, Ioannidou and Konstanikaki (2008) stated that teamwork is a quite effective way in making an individual to be more focus in forming their empathy attitude, by supporting that particular individual by understanding others' needs and providing some suggestions that they probably need, and also cooperating together in achieving a certain goal. This is one of the way to develop individual's confidence in their daily interaction and cohesiveness inter-group members to be in a better harmony.

According to the research finding, empathetical competence is being developed by the lecturers through message transformation as quoted from the following interview.

The implementation of PAI that orients to the problem solving emphasizes on the social problems, social problems, poverty, ignorance, oppression, the difference in loving and

appreciating other human beings and especially other parties, putting service into top priority and to live worthwhile for others, and social empowering,(REK-WWCR-DS)

The development of empathic attitude is directed on the cognitive transformation process via delivery of concepts, facts, principles of materials which are accompanied by social problems. Analysis of social problems is directed to establish students' awareness so that they can feel the experience of being on the shoes of the others as illustrated and according to the analysis of the social problems.

The development of educational package comprises of guideline and textbooks.

After the package is developed, then a validation upon the package is performed. Validation execution on 1 lecturer of material contents and educational/learning design expert.

Table 1. Summary of Educational Package Validation Results

No	Aspect	Validation Result				
		1	2	3	4	5
1	Aim(s)	0	0	0	2	6
2	Material(s)	0	0	0	3	5
3	Recency	0	0	0	1	7
	Mean	0	0	0	2	6
	Percentage	0	0	0	25	75

Descriptions:

It can be seen that, 75% of validation persons saying that it is very valid, 25% of them stating that it is valid, so that the developed educational package can be considered as valid or reasonable to be implemented on Islamic education course.

Discussion

Higher education institution as an educational institution holds a role to form the younger generation hopeful for this nation and it needs to develop a character education which emphasizes on he forming of student's social intelligence. Education is an important aspect in the development of social intelligence, especially during the period of self identity forming, which is performed on the students.

Social intelligence, as well as other self qualities, does not developed automatically. Social intelligence development on each of the students is not only affected by nature factor but also nurture factor. Hence, socialization and education that are closely related with the value of kindness whether in the college, in society or wider environment is essential in the forming of student's character who has a high social intelligence.

Social intelligence as a competence to interact with others needs to be developed. The

intelligence includes sensitivity for detecting others' needs, consciousness to act empathetically or feeling others' hardships and ability in putting own self on others' shoes in a certain social situation. Social intelligence also includes competences in communication, cooperation, sharing ideas, negotiation, acting in full responsibility awareness, etc.

Via Islamic education based on social problems, the students are likely to be able to develop their social intelligence which is considered as one of the important competences that they need to master as the agents of change. According to Goleman (2006), an individual who possesses a high social intelligence has these two major competences as follow. They are: *low-road capacities* means that a basic competence in social intelligence that automatically operates beyond human consciousness and happens quickly. *Low-road capacities* includes: basic empathy and synchronization. On the other hand, *high-road articulations* is a more complex competence in social intelligence which operates with the control of desire or will. It needs some efforts and conscious motive and happens slower, such as: empathy accuracy and effects (*influence*).

The developed educational package contains guidelines, and some validations are executed on the textbooks by the experts of material contents and education/learning design experts. The validation result shows that 75% of the validation persons saying that the package is very valid and the rest 75% acknowledged that it is valid, so that the educational package that was being developed can be considered as valid or proper to be used. FGD implementation FGD implementation for the enhancement of developed package. FGD implementation with the lecturers of Islamic Education and lecturers of educational technology.

CONCLUSIONS AND SUGGESTIONS
Conclusions

The developed educational package is reasonable and can be utilized in Islamic Education. The number of validation persons stating that or stating that the result is very valid were 71.87% and the rest of 28.14% acknowledged it as valid. The developed Islamic education package may optimize character development, especially student's social intelligence.

Suggestions

Package of Islamic education based on social problem as an effort to enhance student's social intelligence can be a reference alternative for lecturers in developing a strategy for developing student's social intelligence. The educational package can be used as a reference for developing an educational package for materials that have the

similar or nearly similar characteristics. The implementation of Islamic education based on social problem can be implemented on other materials since it optimizes the forming of student's social intelligence. ✍

EFFECTIVENESS OF TEACHERS' COLLEGIAL ACTIVITIES IN SUPPORTING PROFESSIONAL DEVELOPMENT

Luki Emiliya Hidayat

Postgraduate of English Departmen, State University of Malang, Indonesia
e-mail: luki.hidayat@gmail.com

ABSTRACT

Teachers' collegial activity is one form of continues professional development (CPD) that aimed to improve teachers' competence. This article aimed at describing the effectiveness of teachers' collegial activity in promoting teachers' professional development. This quantitative-descriptive study involved 31 teachers in Jawa Timur area, using checklist and interview guide as the instruments. The checklist measured the effectiveness of teachers' collegial activity from the aspects of 1) supportive, 2) job-embedded, 3) instructionally-focused, 4) collaborative, and 5) ongoing. It was found out that teachers' collegial activities were categorized "efficient" in promoting teachers' professional development, but needs improvement in the aspects of instructionally-focused and ongoing.

Keywords: *continues professional development, teacher professional development, collegial activity*

Teachers as front liners of the nation in educating and shaping future generation have to dedicate themselves to education and never stop learning. By choosing teacher as a profession, one has to continue learning as long as he or she holds the profession. Teachers have to hold their professional responsibility through Continuous Professional Development (CPD) as long as they are committed to be educators (Amin, 2012; Brown, 2007). They have to continue developing their competence by gathering new information on current teaching methods, strategies, and technology.

In Indonesian context, according to Law No. 14/2005 Verse 8, a qualified teacher is viewed from the following criteria: academic qualification, competence, educator certificate, physical and psychological wellness, and capability to achieve national education target.In addition to the need of possessing the pedagogical knowledge, teachers as professional educators also need to have very good mastery in the subject matter they teach, as well as possess teaching ability and professional responsibility (Minister of National Education Regulation No. 16/2007). Furthermore, teachers' professional development has a big impact to students' learning (Kang et.al, 2013) as it will eventually facilitate the students to achieve optimally (Usman, 2011), and more significantly, students' individual development (Cubukcu, 2010).

Teachers can decide to work on their professional development either based on their own awareness (bottom-up development) or on the requirement of their institution (top-down development). In bottom-up development, teachers become an active initiator and overtakes the responsibility for their own professional growth. As for top-down development, teachers improve their competence because of being enacted by their institutions (Christodoulou, 2010, as cited in Putri, 2015).

In Indonesian school context, teachers as individuals or together with their colleague have to be involved in a learning organization by consciously, voluntarily, and intensively joining different kinds of learning activity to develop their competence (National Education Ministry, 2010). Government Regulation No. 1 2010 on Continuous Professional Development stated that teachers are regulated to develop their competence, one of which is through collegial activity, a scientific summit activity held to help teachers achieve a standard or above required standard in their professional competence. The collegial activity includes: 1) workshop, seminar, or activities held by teachers' community, 2) speaker or participant in a seminar, panel discussion, or other scientific summits, and 3) other collective activities on teacher's practice.

It requires an effective professional development activity in order to achieve the aim of CPD, that is to support teacher's professional competence. According to Hunzicker (2010),an effective professional development activity should

have the following characteristics: 1) supportive, 2) job-embedded, 3) instructional-focused, 4) collaborative, and 5) ongoing.

The first characteristic of an effective professional development activity is supportive, which is a fundamental pre-requisite for learners of all ages (Csikszentmihalyi, 1997) because it supports teacher motivation and commitment to learn.It addresses the learning needs of specific schools, classrooms, grade levels, and teachers (Quick, Holtzman, & Chaney, 2009). It accomodates teachers' individual learning styles and preferences (Tate, 2009) and allows teachers to choose their learning pace and direction (Fritz, 2000; Porter et al., 2003). This combination strengthens teachers' commitment to develop their competenceand increases their motivation to learn (Porter et al., 2003; Smith et al., 2000). Once this supportive characteristic earned, teachers' commitment and intrinsic motivation are established, and therefore, effective professional development is likely to be achieved.

The second characteristic of an effective professional development activity isjob-embedded, which makes it both relevant and authentic. A relevant professional development activity directly addresses teachers' specific needs and concerns (Guskey, 1995) and shows connection between a learning experience and teachers' daily responsibilities (Flores, 2005; Tate, 2009). Furthermore, a professional development activity is deemed authentic when it is integrated seamlessly into each school day (Fullan, 1995). It can be concluded that job-embedded professional development engages teachers in learning through their daily activities and responsibilities, and requires time to consider any possibilities, try out new ideas, and analyze the effectiveness of their actions. According to Tate (2009), job-embedded activities increase teachers' perceptions of relevance and authenticity which in turn, supports professional learning.

The third characteristic of an effective professional development activity isinstructional-focused. It emphasizes subject area content and pedagogy as well as student learning outcomes. An instructional-focused professional development activity supports teachers to increase students' achievement,

which is undoubtly the ultimate goal of professional development (Mundry, 2005; Porter et al., 2003; Quick et al., 2009). Instructional-focused professional development is effective because teachers consider the emphasis on subject area content and pedagogy relevant and authentic to their daily responsibilities. Furthermore, Porter et al. (2003) stated that instructional-focused professional development activity connects to teachers' experiences, which is more likely to result in changed behavior.

The next characteristic of an effective professional development activity is collaborrative, which emphasizes both active and interactive learning experiences through participation in learning communities. Effective professional development engages teachers physically, cognitively, and emotionally through such activities as sharing and discussion, visual representations, simulations and role play, problem solving, application and follow through, and reflection (Lieberman & Pointer Mace, 2008; Mundry, 2005; Porter et al., 2003;Quick et al., 2009; Tate, 2009). In fact, a study asserts that teachers' active engagement in professional development activity booststheir remembering to 90% of what they experience through professional development (Tate, 2009).

Finally, one characteristic of an effective professional development activity is ongoing, which involves combination of contact hours, duration, and coherence. Ongoing professional development activity is deemed effective because the more time teachers spend engaging in professional developmentactivities, such as in study groups, mentoring, and task forces that require active participation over time, the more likely their teaching practice is to improve (Porter et al., 2003; Quick et al., 2009).Research shows that teachers' learning process and changes in teaching practice involve a recursive and continual process that takes place over time (King & Newmann, 2004; Lieberman &Mace, 2008). In fact, lasting change typically takes a minimum of three to five years (Quick, et al., 2009)because teachers often need several months or even years to endure transition from personal concerns about a new innovation to planning, implementation, and management concerns aimed at addressing student needs (Loucks-Horsley & Stiegelbauer, 1991).

CPD has become essential needs in today's education system, which had spawned numerous

professional development activities for teachers in Indonesia to improve their pedagogical and professional competence. However, recent result of National Teachers' Competence Test (UKG) in 2015 showed that teachers' competence was still below expectation, only reaching the average score of 56,69. Therefore, this study needed to be conducted to describe the effectiveness of teachers' collegial activity as one form of CPD that supposed to improve teachers' competence.

This study was expected to provide the following significances: 1) as a resource of information for relevant institutions that organize teachers' collegial activities so that they will pay more attention to the relevancy of the activities and teachers' needs, 2) as a reference for teachers, both pre-service and in-service ones, who look for further information on CPD, particularly in form of teachers' collegial activity, and 3) as an evaluation tool in measuring the effectiveness of teachers' collegial activities.

METHOD

This quantitative-descriptive research was aimed to get description of the effectiveness of teachers' collegial activities in supporting teachers' professional development. The subject of this study was 31 teachers who taught at the level of SMP, SMA, and SMK across Jawa Timur area, including Malang, Singosari, Pandaan, Pasuruan, Batu, Jombang, Kediri, Pacitan, Madiun, Ponorogo, dan Probolinggo. The instrument used was questionnaire in form of checklist that was distributed through teachers' WhatsApp groups, and interview guide. The questionnaire was adapted from Hunzicker's (2010) checklist model of professional development effectiveness, which covered the following aspects: 1) supportive, 2) job-embedded, 3) instructional-focused, 4) collaborative, and 5) ongoing. The collected data was analyzed descriptively using Likert scale with the following weighing method:

Table 1.1 Questionnaire Weighing Method

No.	Attitude	Description	Score
1	Strongly agree	Consistently found	4
2	Agree	Usually found	3
3	Disagree	Inconsistently found	2
4	Strongly disagree	Not found	1

The result was then summated and converted into percentage form and the percentage result was subsequently interpreted into the effectiveness level of teachers' collegial activity: very effective, effective, fairly effective, and ineffective, using the measurement in the following table:

Table 1.2 Qualification of Teachers' Collegial Activity

No	Percentage Score	Category
1	85% - 100%	Very Effective
2	75% - 84%	Effective
3	65% - 74%	Fairly Effective
4	55% - 64%	Ineffective

RESULT AND DISCUSSION

Result showed that the effectiveness percentage of teachers' collegial activities viewed from the aspects of: 1) supportive was 83,71%, 2) job-embedded was 83,60%, 3) instructional-focused was 75,60%, 4) collaborative was 78,76%, and 5) ongoing was 77,15%. Overall, the average percentage of the effectiveness of teachers' collegial activitiy was 79,77%, indicating that the activity was generally categorized effective.

Despite the good result, the effectiveness of teachers' collegial activity still needed to be improved, particularly in the aspects of instructional-focused and ongoing. In the aspect of instructional-focused, relevancy of the materials discussed in teachers' collegial activity and materials in the teachers' real classrooms was not categorized effective yet, gaining the percentage of 72,58%. It was also found out that the ability of teachers' collegial activity in improving students' achievement was not categorized effective yet, gaining the percentage of73,39%. Another effectiveness aspect that needed to be improved was ongoing, in which the ongoing communication between teachers after the completion of the collegial activity was not categorized effective either, gaining the percentage of73,39%. The result

of the data collection was summarized in the following chart:
Figure 1. Effectiveness Percentage of Teachers' Collegial Activity

Althoughtheoverallaverage percentage of the effectiveness of teachers' collegial activity was categorized effective, there were some aspects, however, that needed to be improved. The first was the effectiveness from the aspect of instructional-focused, particularly in the relevancy of the materials delivered in teachers' collegial activity and materials in the teachers' actual classrooms. From interview with some teachers, it was revealed that the cause of this matter was probably from the activity organizer who did not conduct needs analysis prior to the event. Therefore, there were gaps between the materials or topics delivered in the teachers' collegial activity and the materials the teachers face in their actual classrooms. Another possible cause came from the teachers themselves, who were frequently joined in the teachers' collegial activity mainly for the sake of the credit point they would get from the certificate awarded by the organizer. The credit point would be beneficial in improving teachers' career stage.

Another effectiveness from the aspect of instructional-focusedthat needed attention was the effectiveness of teachers' collegial activity in improving students' achievement. It is clear that the ultimate goal of professional development is to increase student achievement; therefore,teachers' collegial activity should support teachers to achieve that goal. Effective teachers' collegial activityshould focus on both subject area content and how to teach it so that teachers would have a very good mastery in

their subject area content to anticipate students'difficulties and engage students in learning through various instructional strategies.

Another effectiveness aspect that needed to be improved was ongoing, in which the ongoing communication between teachers after the completion of the collegial activity was not categorized effective. From interview with teachers and analysis on previous research, it was revealed that this happened because teachers perceived their learning experiences in different way and they needed a recursive and continual process within several months or even years (Loucks-Horsley & Stiegelbauer, 1991) to absorb new information before eventually made a change in their teaching practice(King & Newmann, 2004; Lieberman & Mace, 2008).

CONCLUSION

This article describes the effectiveness of teachers' collegial activity in supporting teachers' professional development. In general, teachers' collegial activity in Jawa Timur area of Indonesia was categorized as effective, although some aspects of effectiveness needed to be improved; they were the instructional-focused and ongoing aspects. It is essential for teachers' collegial activity organizer and the teachers to organize and participate in learning activities that are effective in terms of supportive, job-embedded, instructional-focused, collaborative, and ongoing aspects so that it has significant, meaningful impact in improving teachers' competence.

ABSTRACT

This article focuses on moral values in adolescents who diminishing. Adolescents are individuals who are in the process of evolving. To reach maturity, the teens need guidance, because they still have little understanding of themselves, their environment and in determining the direction of his life. Youth development is inseparable from environmental influences physically, psychologically and socially. One that can affect adolescents that any deviation values that should be owned by teenagers. That is partly a result of a cultural shift that makes teens increasingly want to follow the changes in the new culture. This led to a negative, namely the establishment of greed such as consumer behavior and hedonism. Characteristics of adolescents who have greed among other anti-social,narcissism and a lack of gratitude for something that they already have. To inculcate gratitude need the required media that effective and practical to do . Culture is an aspect that is capable of being an alternative media, one of them with the traditional game of "Cublak Cublak Suweng". The game has a meaning of happiness should have be obtained through a clean conscience and gratefully. Thus it can be applied in group guidance services that enable each member of the group to interact in the game, resulting in the transfer of knowledge from one another by giving meaning to each of the steps in the game. Therefore, through the game "Cublak Cublak Suweng" can inculcate moral values in the form of gratitude that is expected to minimize the greed owned by teenagers.

Keywords: gratitude – group guidance – traditional game

Teenager is constitute a period in life human limitations age nor role often no too clear. Adolescence often considered as time transition, where moments when child no want again be treated as children, but from growth physical childern not yet could said adult. According to Anna Freud (in Joseph. S, 2004). Adolescence too be known with time storm and stress where happen upheaval emotions that accompanied growth rapid physical and growth psychicvaried. Adolescence constitute time for search identity or identity self. Individual want get recognition about what can he produce for others. Adolescence including a crucial period because at this age children experience a lot of changes in psychic and physical. In addition, adolescents are individuals who are in the process of evolving. To reach maturity, the teens need guidance, because they still have little understanding of themselves, their environment and in determining the direction of his life.

The times in this era of globalization has changed the values of human life and moral values especially teenagers, it is a result of a cultural shift that makes teens increasingly want to follow the changes in the new culture. One result of these developments is the emergence of a negative, namely the formation of greed in adolescents such as consumer

behavior and hedonism. According to the hedonic style Kartono in Yanti (2016), said which means a lifestyle *of hedonism* or worldview that considers that the pleasures and the material is the main purpose of life, and this lifestyle experienced by teenagers. Thus, the lifestyle of hedonism owned teenagers today to cause greed which means want to have anything to excess without being satisfied, in addition to the nature of the greedy desire is that thinking about happiness in the form of material and non-material as much as possible not concerned with ways in which to get it , This becomes a problem for teenager in time transition which makes teens capable of doing everything possible to obtain a material and non-material happiness. Characteristics of greed teenagers like, many teens are anti-social, narcissistic personality disorder and lack of gratitude possessed teenager.

To overcome this, teen should be grateful on what they have in this life. As far as this character greedy on. Adolescence could influence welfare psychological. For identified process psych ological to be used for againt case this is gratitude (McCullough and Polak, 2006). This matter because that grateful constitute emotion positive. Gratitude has the power to change social cognition, motivation, and social relations with the right, one of which is a way that may be used to reduce greed. Grateful able to make a person better, it can refrain from exaggeration in obtaining

something. Gratitude high is expected to minimize the greedy nature of adolescence as Froh in Lopez study (2009) showed that individuals who are grateful tend to exhibit positive health and behavior than individuals that are less grateful.

In instill gratitude in adolescents, can be a variety of ways one using guidance and counseling services, one of which is a group guidance. However, guidance services group which has been granted only based delivery of information only, so that the services rendered less effective for adolescents. characteristics of young people prefer learning that is active and involve youth. According to Piaget in Alfiani characteristics of young people, actively using reactions that are "trial and error" to study the objects around it. The guesswork was doing began to change his movements to achieve a clearer objectives (Alfiani, 2015). So, teenager need for services that are active and involve youth, so that teenagers would be interested in such a service.

Hence, to instill gratitude required effective techniques, active and involve youth in doing so. In connection with the guidance of the group, with a culture that is one aspect that has alternative techniques. Theres a connection between group guidance service with the culture and the benefits of their own culture to be seen from an understanding of the culture itself. according to Harris in Birukou (2009) said "A culture is the total socially acquired life-way or life-style of a group of people. It consists of the patterned, repetitive ways of thinking, feeling, and acting that are characteristic of the members of a particular society or segment of a society ". Thus there is a connection between groups guidance services with cultural . Implementation culture one can through traditional games. In the traditional game contains the values of education are not directly visible, but sheltered in a symbol and values (Nugrahastuti, 2015). Many traditional games that have meaning and value of gratitude, one of which is "Cublak Cublak Suweng".

The game "Cublak Cublak Suweng actually has much meaning in the game. *Cublak-Cublak Suweng* has a value of cooperation, the value of harmony, the value of creativity, and so on, in which these values can be entered in three categories: value affective, values of cognitive and value psychomotor (Herath, 2014). Traditional games can be applied in group guidance services that enable each member of the group to interact in the game, resulting in the transfer of knowledge from one another by giving meaning to each of the steps in the game. Therefore, through the

game "Cublak Cublak Suweng" can instill moral values in the form of gratitude that is expected to minimize the greed owned by teenagers.

STUDY
Group Guidance

Group guidance services is the provision of information or assistance is intended to achieve certain objectives held by the group and given shape by the supervising teacher. This strengthened by rusmana who said that the group guidance can be defined; as a process of assistance to individuals through group atmosphere, this allows each member to learn to participate actively and share experience in the development of knowledge, attitudes or skills required (Rusmana , 2009). Thus, guidance group is a service that is preventing but also develop the potential within the individual by way of receiving information that is useful in supporting their daily lives.

In the provision of guidance services have a wide range of interest groups. Where each destination in the group guidance services support the ability and potential within the individual. according Romlah is the purpose of group guidance to help individuals find themselves, self-directed and able to adapt to their environment (Romlah, 2009). While Prayitno explaining the purpose of guidance more spesific.

According to Prayitno The purpose of the guidance of the group include: a) Being able to speak in front of people; b) Ability to express opinions, ideas, suggestions, comments, feelings and forth to the crowd; c) Learn to respect the opinions of others; d) Responsible for the opinion put forward; e) Being able to control yourself and keep your emotions (negative shocks mental); f) Can tolerate; g) Become familiar with each other; h) Discussing issues or topics of general perceived or common interest. (Prayitno, 2009)

Thus, group guidance services has a goal that increase the potential within each individual but in the group conditions. With group guidance services, individuals will learn to be an independent person and competent. Wicaksono said that the purpose of group guidance is to make counselee become be autonomous in the arrangement of his life, his self-confidence and in terms of decision-making (Wicaksono, 2013). Thus, through group guidance services, individuals will be trained in various skills which are useful for later life.

according Prayitno (2009) there are four Phase of group guidance, namely:

Phase (I) formation, at this stage an introduction phase, phase or stage for involving themselves insert themselves into the lives of a group.

Phase (II) an intermediate stage, at this stage after the atmosphere formed the group members

and the group dynamics have started to grow, the group's activities should be carried further by the leader of the group headed to actual group Activities.

Phase (III) of group activities, this stage is the core activities of the group, the aspects into the content and the accompanying need to get the attention of the leader of the group.

Phase (IV) termination phase. At this stage it would put an end to the activities at the time were considered appropriate

In group guidance services have a wide range of technique services. The provision of this service techniques are used based on the situation and needs of each individual member. There are several techniques that can be applied in the service of group guidance services. according Romlah, techniques commonly used in the guidance of the group is the provision of information *(ekspository techniques),* group discussion, problem solving (problem-solving techniques), *game hubungan (role playing)* consisting of sociodrama and psychodrama, simulation games, field trips and the creation of an atmosphere kinship. (Romlah, 2009). Thus, various techniques can be used in the provision of guidance services based on the needs of each individual. For example if you want to create an atmosphere of active guidance services, then in the group guidance services using techniques that are active such as role playing, psychodrama, *roleplaying* and others.

One technique in group guidance services such as simulation games have many benefits in its implementation. According to Justine Howard (2011) said the benefit of the game that says *"Game Techniques in improving the understanding, planning and practicing self-confidence".* So, the game in group guidance services, youth will increase our understanding of planning and train confidence. Thus, the game will train a lot of understanding of the values that will be delivered.

The traditional game "Cublak-Cublak Suweng"

Culture is something that belongs to the whole country. With culture, signaling a hallmark of characteristic every region and even a country. Culture so is important because the culture itself has a very important role in a country. Birukou said "Culture means the whole complex of traditional behavior of the which has been developed by the human race and is successively learned by each generation" (Birukou, 2009). Culture itself has a very important role. According to Bascom there are

some roles that culture, as a projection system, as an educational tool and as kontorl that the norms of the community will always be respected member of the collective (Manuaba, 1999). So, culture has an important role in the development of the country both in terms of education and of the norms.

Form of culture that was in Indonesia there are various, one of them was a traditional game. The traditional game has a very important role in the development of learners. In the traditional game contains the values of education are not directly visible, but sheltered in a symbol and values (Nugrahastuti, 2015). thus the traditional game has a value-value that can be taught to children and has its own characteristics. Besides from the traditional game that play by children have a wide range of benefits. Many of the benefits derived from the traditional game. According to Ki Hadi Sukatno benefits of playing traditional games children will learn to imitate the act, to test the strength and skill, trained sensory, language training, to train children in the art of the art sound and rhythm (Agni, 2015). in that case, from the traditional game not only train one's ability, but a wide range of abilities will be obtained and will be embedded in the child.

In Indonesia has a wide variety of traditional games that are still played. one of these games is Cublak-Cublak Suweng. *Cublak-Cublak Suweng* comes from word *Cublak Cublak* which means a perfume; *dicublak* meaning a knock or dredged. *Suweng* means pendants (Herath, 2014). Cublak-cublak suweng is traditional game from Java. by Herath Cublak-Cublak Suweng a traditional game *Cublak-Cublak Suweng* have the same values of cooperation, harmony values, the value of creativity, and so forth (Herath, 2014). History of Cublak-Cublak Suweng itself there is a saying that Cublak-Cublak Suweng created by one of the members, or the Sunan of propagator of Islam in the archipelago also called wali Songo is Sunan Giri. According Wibhyanto that song dolanan children in Java, the work of Sunan Giri (1442M) contains poems 'sanepo' (symbol) that is full of meaning, of the values of the primacy of human life (Wibhyanto, 2013). but in another article describes one of the characters in yogyakrata Ki Hadi Sukatno, but did not mention that Ki Hadi Sukatno the creator Cublak-Cublak Suweng. Sukatno more clear that these kinds of games are sung among others, such Cublak-Cublak Suweng.

In this game has several stages, this game played by at least 3 people were sitting in a circle. One of the cast members are curled up in the middle of the circle, and the circle of players who play the game on back's players who curled up. When in the game each member sings a song the playing song which has special meaning

Lyric like this:

Cublak-Cublak Suweng
(The jewelry)
Suwenge ting gelenter
(Watch scattered)
Mambu ketundung Gudel
(Smell buffalo)
Pak Empo lera lere
(Mr. toothless saw to right to left)
Sopo ngguyu ndhelikake
(Who hide will laughs)
Sir sir pong dele kosong
 (Sir sir pong empty soy)
Sir sir pong dele kosong
 (Sir sir pong empty soy). (Yuliani, 2014)

In the lyrics and the activity in the game has a lot of meaning. many people are interpreting this game from a variety of viewpoints. It has been suggested that the game is able to exercise creativity, some said that the game is to train students to stay focused and attentive, and so forth. while according to the viewpoint of Wibhyanto said that Cublak Cublak suwen means "To find real happiness treasure humans do not obey one's own desires or greedy, but everything back into the conscience, so that it could spill treasure happiness overflows into a blessing for anyone" (Wibhyanto, 2013), and   is therefore based on the lyrics of the song can reflect on gratitude. This is reinforced by the movement in the game. No one noticed when palyer Curled up in teh middle of circle of the members. Curled up is a movement on gratitude. Thus, the game has a meaning of gratitude itself.

Implementation Cublak Cublak Suweng in group guidance services

traditional game Cublak cublak Suweng has a very deep meaning about gratitude. This is especially useful for adolescents in living in an era that is growing increasingly rapidly. This gratitude is necessary so that teenagers will receive and respectful what has he gained during this time and will reduce greedy behavior.

The implementation of Cublak-cublak Suweng, this game can be implemented in group guidance services. Tutoring services group that is the traditional game of choice in implementing Cublak-Cublak Suweng because in group guidance services can improve the potential in adolescents. Besides According to Babatunde, "Group guidance is organized to Prevent problems and the purpose of group guidance in school setting is to provide educational and vocational information the which is not systematically taught in academic courses." (Babatunde, 201 3). Therefore. Group guidance is a service that is preventing. In addition, the guidance of the group is also a service that helps teenagers in solving the problem in the daily life. This statement Wicaksono clarified by saying Guidance Group is a group activity that is carried out by a group in order to discuss a few things, to support their daily living as well as for consideration in decision-making as a form to prevent the problem and develop the potential (Wicaksono, 2013). This is similar to saying Widitya who said group guidance services intended to enable students jointly acquire a variety of materials from a useful resource for everyday life both as individuals and as students, family members, and community (Widitya, 2014). Similarly game Cublak-Cublak Suweng can be implemented in group guidance services.

In addition Implementation of the game can be done in group guidance services because there is a group guidance techniques that have relevance to the conduct of the game. techniques services that can be applied in group guidance services there are various, among other things like *games hubunganan (*roleplaying*)* consisting of sociodrama and psychodrama, simulation games, field trips and the creation of a family atmosphere (Nartoyo, 2013). In the service of group guidance to do techniques simulation game, in which the provision of material and information provided by using a traditional game involving members of the group. According Romlah (2006), the simulation game is a game that is meant to reflect situations which are in real life with some modifications. thus there is a link between the group guidance Cublak - Cublak Suweng. Thus the services using game techniques is effective for adolescents, in which adolescents are more like services involving the teens themselves and teenagers prefer services that are active in the process of its services.

Implementation Cublak-Cublak Suweng in group guidance services through several phase of the formation, the intermediate stage, the group's activities, termination phase (Prayitno, 2009). In the group there are leaders who lead the group guidance process. In the early phase, namely the establishment phase, members of the group introduce themselves each and outlines the objectives and expectations of each of their respective members. Once they are familiar with each other, the next phase is the intermediate phase. In this phase is a bridge between phase one to phase three. In this stage the group group leader made the atmosphere more conducive and dynamic. As is done in this phase such offer or observe whether the member is ready to run the activities, discuss the atmosphere occur, improve the participation of members and others.

In the next phase of the group's activities, traditional games Cublak-Cublak Suweng can be implemented. When the condition is already a dynamic group, each member of the group guidance play the game Cublak-Cublak Suweng. The first step in all the sitting members sit circle, then selected one member to curl up in the middle. Then start the game was moved stone or seeds from one hand to the other on the backs of players huddled. This activity is done singing Cublak-Cublak Suweng. after the song is nearing end, the stone stopped at one of the members. After it, the members of clasped hands, one of which holds the stones or seeds. Not only the person who brought the stone clasped hands, but also all the members clasped of both hands. Afterwards the members who curled up and guess who is holding the stone. If the correct guess he replaced that had curled up, if the guesses is wrong still remained curled for the next round.

After several rounds of the game, the next entry in the termination stage. At this stage, the leader of the group members to say that the service will soon be over. In this stage members and leaders to discuss the meanings of the songs sung during the game progresses and explain movements in the game. Thus the guidance of members in the group will be to understand and interpret what he has played before. After understand and interpret the content of the game, group guidance services may be terminated.

Although the service was just teenagers who are involved in the service, but the teacher guidance and counseling also have an important role in this service. Teacher guidance and counseling role is to steer teens and conveys the intent and straighten the meaning of the game if the teen is still difficult and misunderstand the meaning of the game, in addition to the teacher guidance and counseling should prepare a variety of things such as a conducive and prepare the youth in the state good when it will receive group guidance services. Thus, through the role of guidance and counseling teachers, the benefits of this game will be received by teenagers correctly. The benefits of this game is a teenager would understand, learn and understand the meaning of thanks and gratitude to implement embedded in him in life.

CONCLUSION

The times have changed paradigms and values of human life, especially teenagers, including in terms of behavior. One negative behavior among teenagers today are greedy. Greedy is a trait want to have anything to excess without being satisfied, in addition to

the greedy nature of desire is that thinking about happiness in the form of material and non-material as much as possible no matter the way to get it done. Thus, the need to instill gratitude in adolescent self. This can be done in various ways one of them using a traditional game that is used as a medium in guiding and instill a sense of gratitude in adolescent self. Cublak-Cublak Suweng have deep meaning associated with gratitude. Meaning of gratitude is in Cublak-Cublak Suweng seen in the song and movement in his game. The game is done in groups. Cublak game-Cublak Suweng can be implemented in group guidance services. With these services group guidance is the provision of information or assistance is intended to achieve certain objectives held by the group and given shape by the supervising teacher. Through the guidance services that implement Cublak-Cublak Suweng, will instill a sense of gratitude in adolescent self. So teens will understand the meaning of gratitude through the game.

A GROUP SOLUTION-FOCUSED GUIDED IMAGERY COUNSELING TO OVERCOME ELEMENTARY SCHOOL STUDENTS' PROBLEM

M. Ramli

State University of Malang, Malang, Indonesia
Email: m.ramli25@yahoo.com

ABSTRAK

Upper grade elementary school students, especially the sixth graders, are in puberty period—the beginning period of early adolescence. At this time, the reproductive organs have started to mature. Therefore, it affects all aspects of student development relating to the development of personal, social, learning, and career planning. In the implementation of developmental tasks, upper grade elementary school students face a variety of complicated problems relating to personal, social relationships, learning, and career planning. Their problems are physical development problems, health problems, personal development problems, social adjustment problems, academic problems, and career planning problems. In order that elementary school students can carry out developmental tasks optimally, they need to be helped to overcome the problems encountered by counseling models. Among them is a group solution-focused guided imagery counseling. The counseling model is potential to be effective and efficient in helping school setting counselees overcome their recurrent problems. Because of that, the group solution-focused guided imagery counseling is expected to be effective and efficient in helping elementary school students construct solutions for their problems. A group solution-focused guided imagery counseling is a process of constructing solutions to problems faced by students step by step imaginatively guided by counselor direction. This paper focuses on the description of the techniques and procedures of group solution-focused guided imagery counseling to help elementary school students construct solutions for their problems in order to achieve optimal development.

Keywords: group counseling, solution-focused guided imagery, elementary school

Elementary school students are at the end of childhood. However, in general, students at the end of elementary school (the sixth graders), are at puberty, in the beginning of early adolescence. This can be understood from the periodization of human development according to Hurlock (Ramli, 2005) which stated that children aged 10/12 years to 13/14 years are at puberty/preteens. At this time, the reproductive organs have started to mature so they affect all aspects of child development, whether related to the development of personal, social, learning, and career planning.

In its development, upper grade Elementary Students must learn to perform the developmental tasks of of puberty that is no longer at late childhood. Social environment considers them still children, but in terms of their development, they have already been puberty. Therefore, there are often conflicts between themselves and the social environment, especially parents and teachers. The conflict is exacerbated by exposure to printed media, electronic, or internet that is less favorable to their development in a positive direction. Therefore, a final grade elementary school students potentially face a variety of problems, whether personal, social relationships, learning, and career planning. The problems that plagued them based on research are as a matter of physical development and health, personal development issues, and social adjustment problems (Kartadinata, 1999); Personal problems, social adjustment problems, and academic problems (Furqan, 2005).

In order that elementary school students can carry out developmental tasks optimally, they need to be helped to overcome the problems encountered. For that, a lot of guidance and counseling models can be used. A model of guidance and counseling services that is effective and efficient for improving the quality of students' personalities is solutions-focused counseling (Franklin & Hopson, 2008; Charlesworth & Jackson, 2004; Gingerich & Eisengart, 2000; Littrell, Malia, & Vanderwood, 1995; Capuzzi & Gross, 2009). To improve the effectiveness and efficiency of solutions-focused counseling in counseling services with a flexible group size so that it can answer the real needs of counseling services requires the visits counselor in primary school were able to help many students at one time because of the limited number of roving counselors, while students who need to be helped very much. Therefore, solution-focused counseling that is already effective and efficient need to be developed as a group counseling that can help students in flexible groups according to the needs of small groups, classroom groups, and large groups.

For that, the solution-focused counseling need to be combined with the technique of guided imagery that provide stimulation to a group of

students to perform activities imaginatively step by step under the direction of counselor as a group leader to address the problems faced by students (Learner & Klessmann, 1983 ; Roseman, 2000; Hall et al, 2006). Thus, the solution-focused counseling alloy with guided imagery techniques into counseling model of group solutions-focused guided imagery. The counseling model is potentially effective and efficient in helping adult counselees overcome their recurrent problems (Sklare, Sabella, and Petrosko, 2003; Sklare, 2014). The solution-focused counseling is effective and efficient to help elementary school students to solve their problems (LaFountain & Garner, 1996; Geil, 1998. Besides, a guided imagery is an effective technique for helping elementary school students overcome their problems (Omizo, Omizo, and Kitaoka, 1998). Given the group solution-focused guided imagery counseling model is potential effectively and efficiently for helping counselee solve their problems, then the counseling model is expected to be effective and efficient in helping elementary school students overcome their problems. Therefore, the counseling model needs to be explored, especially, the techniques and procedures of the counseling model for helping primary school students solve their problems.

Techniques of Group Solution-Focused Guided Imagery Counseling

The following counseling techniques derived from solutions-focused brief counseling used in the implementation of the group solution-focused guided imagery counseling. Some of the techniques generally used are as follows (Prochaska & Norcross, 2007; Gladding, 2009; Corey, 2012; Sklare, 2014).

First, Exception-finding questions: questions about the moments when the counselees are free from their problems. The discovery of exceptions helps counselees clarify the change conditions, has the strength and ability to solve problems, provides tangible evidence of completion and helps the counselees to find the forgotten strengths used to achieve the expected goals. For example, "When were you able to manage this problem calmly?" "When did you do differently from that now?" " Let me point out times when you are free from your problems!"

Second, Miracle questions: questions leading counselees to imagine what would happen if a problem is experienced miraculously resolved. This technique helps clarify goals and highlights problem exceptions by stimulating the counselees to imagine a solution and eliminate obstacles in solving

problems and building expectations for the expected changes. For example, counselees were asked, "Imagine that one night, while you were asleep, there was a miracle and all your problems that you put forward today resolved. How do you know that the problem was solved? What were you doing at that time which shows that the problem was resolved completely?"

Third, Scaling questions: questions that ask counselees make the abstract become concrete, vague become clear by quantifying strengths, issues, circumstances, or counselees' changes. Generally, scaling questions are used to help counselees see their progresses. For example, " On a scale ranging from 1 to 10, where 1 means you have no control at all to your problems and 10 means you have full control over your problems, then on what number will you put yourself on that scale ? and "What will you do when you go up one number on the scale?"

Fourth, Compliments: Written or oral messages designed to provide reinforcement, rewards, and praise for the strengths, progresses, and positive characteristics for the achievement of the counselees' objectives. This technique is often used before counselees given the task at the end of counseling sessions. For example, the counselor statement, " I am very impressed with the zeal to achieve your goals so that you can explain in detail about the objectives, the means that you will implement to achieve these objectives, and the ways that will be used in dealing with barriers to achieve the goals."

Fifth, Presession change questions are the questions that are aimed at finding an exception or explore solutions that have been attempted by counselee before the counseling session. The goal is to create hope for change, emphasize the active role and responsibility of counselees and show that change can occur outside the counseling room. For example, the counselor asked, " Since the last meeting, did you notice any change in you? " or "Since the last meeting did you find a new way of seeing the problems that you experience? " or "Since our conversations on the phone last week, what changes have you experienced so far ?"

Sixth, The formula first session task: The format of homework given to counselees by the counselor to be done between the first and the second meeting. For example, the counselor said , "Between now and the next meeting, I hope you can observe what happens to your problems that you want to continue to maintain so that you can explain it to me at the next meeting." At the beginning of the second counseling meeting, counselor asks counselees what has been observed so far and ask them what they want to continue to be maintained with regard to their problems.

Seventh, Giving feedbacks is a technique used by counselors to convey messages to the counselees in order to be motivated to achieve the desired objectives. Feedbacks consist of three elements, namely compliments, bridging statements, and the tasks assigned to the counselees. Compliments contain counselees' progress made to achieve the goals effectively. Bridging statement contains a sentence that connects the destination to a given task. Tasks contain what counselees need to be done to achieve the desired objectives consisting of observations or actions taken to achieve the goal. For example, "I am very impressed with your attention to your problems. You can explain the expected goals in detail. Similarly, you can express clearly the ways to overcome your problems. More than that, you have a high motivation to carry out the ways to overcome your problems. In order to overcome your problems so that you can move to number 5 in the scale, then I hope that you carry out the ways to overcome your problems that you pointed out earlier."

Procedures of Group Solution-Focused Guided Imagery Counseling

A procedure of group solution-focused guided imagery counseling is a process of solution construction by counselee imaginatively progressive to their problems through counselor's direction to raise awareness of their sources of solutions, the realization that the changes taking place on an ongoing basis, the realization that every problem has exception (times when the lack of problems / the least severity of the problem, and creative construction of solutions to the problems experienced by counselees.

Implementation of the group solution-focused guided imagery counseling consists of thirteen steps beginning with an introduction and information of goals of counseling followed by step by step from step one to step thirteen. The media used are counseling worksheets consisting of fourteen pages. Each sheet contains activity directives at the top of the page and followed by space in the bottom as counselees write imaginative responses to the directives given by counselor for every step.

The procedures of group solution-focused guided imagery counseling are as follows (Sklare, 2003).

Opening

At the opening, the counselor informs goals and counseling implementation steps as follows. In this activity we are going through a process to help you deal with problems that often arise that you want to overcome. It may be something you want to do but do not do now or something you want to stop. You will get an order to direct you step by step through the process.

Each page of counseling worksheets that you receive contains directives for each step in this activity along with an empty section to write responses. In most of these steps, I will ask you to close your eyes and imagine the situation that I described to you. Then I'll give you some time to write down your responses. Please look up when you are finished writing a response on the move so that I know when I am going to read the direction of the next step.

Before you begin, please note that if I asked you to bring up things or specific measures that you will do, then let you respond with behavior that can be observed and detailed. For example, instead of saying, "I will be friendly." Then pointed out specific behaviors that you will do to show that you are friendly, like, "I would smile, say hello, and shake hands." Indicate what will you do as if you observe yourself in the film. Remember, look up when you have finished writing your response to a step.

Step 1

Just close your eyes and describe the problems that often arise that you want to overcome or want to overcome personal challenges more effectively. As mentioned earlier, this could involve something you want to do, or something you want to stop. On a scale of 1 to 10, where 1 means very severe problem and has not been resolved, while 10 means the issue is resolved completely. At what number you now?

In the space, show what number you are on now. My numbers are (circle one number):

Theproblem is so severe	The problem is resolved
1 2 3 4 5	6 7 8 9 10

Step 2

Just close your eyes. If your problem involves something you want to do, describe the specific behaviors what you want to observe yourself. If your problem involves something you want to stop, describe what you want to do instead. On a problem, visualize what kind of behavior that, as if a video show you want to do. Focus on something that you do, not on something that does not want you to do.

Once you visualize a mental image of what would you do, write a description of what you describe in the space below. Remember, do not describe what you do not want to do, but discribe what you want to do.

Step 3

With eyes closed, imagine that a miracle happened overnight while you sleep, and this miracle resolved your problem. But, as you sleep, you do not know that the miracle occurred. When you wake up, what little things would indicate to you that this miracle happened? What will you see that you are doing something different from before? Think of a specific action to be performed after the miracle happened.

Write a brief description of the mental picture of what would you do differently below.

Step 4

With eyes closed, imagine what else would you see that you're doing, thinking, or saying something different after a miracle occurred. Write a description of what you see that you're doing, thinking, or saying something different after a miracle occurred!

Step 5

With eyes closed, describe who will see different things you do. Imagine how you will respond when they see a change in your behavior. In the space below, write a description of what you imagine the other person's response to you.

Step 6

Just close your eyes and imagine what will you do to give back to the behavioral response of other people you described in the previous step. In the space below, write a description of your response to the other person.

Step 7

With eyes closed, imagine in your mind a time when you experienced this problem but some of this miracle has happened, though slightly. Write down a description of what you imagine!

Step 8

With eyes closed, picture in your mind of how you can make the most of these miracles happened during the time of having problems. This process can be thought or act differently.Write down a description of what you imagine that you think or behave that makes some miracle happens.

Step 9

Just close your eyes and think how happy you are now with your efforts at that time. In the space below, write what you thought about the efforts made to make some magic happen.

Step 10

Now, how is your problem condition if it is associated with the following scale.

On a scale of 1 to 10, where 1 means the problem is very severe and has not been resolved, while 10 means the problem is resolved completely. At what number are you now?

In the space, show what number you are on now. My numbers are (circle one number):

The problem is so severe
1 2 3 4 5 6 7 8 9 10

Step 11

On a scale, you are at that number as you wrote down in step 10. If you are a higher rate than the current rate, then what would you do that was not done at that time? Write on the space below what would you do!

Step 12

Write a short note about yourself that explains what has been discovered and rediscovered about yourself and your situation!

Step 13

On a scale of 1 to 10, where 1 means very severe problem and has not been resolved, while 10 means the problem is resolved completely. At what number, are you now?

In the space, show what number you are on now. My numbers are (circle one number):
The problem is so severe
1 2 3 4 5 6 7 8 9 10

CONCLUSION

The sixth graders of elementary school potentially face a variety of problems, whether personal, social relationships, learning, and career planning. The problems are matters of physical development and health, personal development problems, social adjustment problems, and academic problems. In order the elementary school students can carry out developmental tasks optimally, they need to be helped to overcome the problems encountered by counseling models. Among them is a model of group solution-focused guided imagery counseling. The counseling model is potentially effective and efficient in helping adult counselees overcome their recurrent problem. The counseling model consists of a solution-focused brief counseling and a guided imagery technique. Both are effectively and efficiently used to help elementary school students overcome their problems. Therefore, the counseling model of group solution-focused guided imagery is expected to be effective and efficient in helping elementary school students overcome their problems. For that, it needs to be explored the techniques and procedures of group solution-focused guided

imagery counseling for helping primary school students overcome their problems.

Techniques of group solution-focused guided imagery counseling consist of exception-finding questions, miracle questions, scaling questions, presession change questions, a formula first session task, giving feedback, and compliments. In practice, the counseling model of group solution-focused guided imagery consist of steps: asking a scaling questioning, goal setting, asking a miracle question, asking what else questions, asking reciprocal relationship questions, asking reverse reciprocal relationship questions, asking instances of success, detailing instances of success, strengthening the success, asking a scaling question, moving up the scale intervention, giving feedback, and asking a scaling question.

PEACE EDUCATION, THE WAY OF RELIGION AND SPIRIT " THE UNLIMITED OCEAN OF LOVE"

M Thoriqul Chaer
S.…
Email: …

ABSTRACT

Indonesia is pluralist nation, where cultural plurality and diversity are hinted at the existence of differences. The understanding and management of diversity and multicultural will generate a positive force for the development of the nation. On the contrary, when it is not understood and managed correctly, diversity and multicultural tend to be destructive factor and disaster. Conflict and social violence that often occur among communities are part of diversity and multicultural which are not managed properly. Religious conflicts as happened in Maumere (1995), Surabaya, Situbondo and Tasikmalaya Rengasdengklok (1996), (1997), Solo, Jakarta and Kupang (1998), Poso, Ambon (1999-2002), did not only claim that the casualties are not simple, but also destroyed hundreds of places of worship (churches or Mosques). Similarly, notes smelling of ethnic violence, such as certain ethnic violence in West Kalimantan (1933), Central Kalimantan (2000). Therefore, it is to conduct as early prevention efforts, so that such events do not reoccur in the future. For thus reason, the religious understanding of inclusive needed. Borrowing the wishfull thinking of Malinowski; the existence of a conviction despite the religious truth are considered nil, but the religion still has a positive role which is able to help the frustration and must the social union

Keywords: plurality-the way of religion-social-religious problems

Indonesia society is a plural society, it can be seen from its diversity of peoples, languages, religions, customs and cultures. Suparlan, 2001:2, see also Geertz, 1982:105; Shihab, 1998:40; Nasikun, 1984:10) said that the General compound (plural society) is the community being formed due to the ethnic communities-communities that exist have been directly or indirectly forced to unite under a national system.

John Sydenham Furnivall include people who first mentioned Indonesia enter into the category of community compound (plural society). The community thinks is a pluralist society in which value system embraced a variety of social unity into its parts make them have less loyalty to society as a whole, lacking its homogeneity of culture or even lacking the basics to mutually understand each other (Nasikun, 2006:39).

A plural society, the potential for conflict is very possible happening. Spectrum of conflict can be sourced from various things, such as: the existence of a conflict between religions, conflicts between ethnic conflict between cultures, tribal conflicts or conflicts of interests between people from different provinces or regions. David a. Nadler (1970) as set forth by Anoraga (1995:54) and Thoha (2007:33) stated that human behavior is as a function of the integration between the person or individual with the environment. Various characters shown by individuals in accordance with jabatanya of course will vary. And his behavior is

determined by each environment are indeed different.

The interaction of individuals in a plural society, allowing the existence of a claim of truth (truth claim) and the character of missioner religion triggers a clash of religious life and the incidence of wrong understanding between faiths. This is because every religion declared his teachings as the totality of the system meaning that applies to all life, both individual and social (Hidayat, 1993:11; 21 February 1987 tempo; Pahrudin dkk., 2009:148).

Understanding religion in Indonesia society is generally understood as a system of beliefs, behaviors, values, experience, oriented to the spiritual problem/rituals used interchangeably in a community and are passed on between generations in the tradition. The assertion that want conveyed here is that the consequences of religious understanding that rigid, non-scientific will bring up negative stigmatization against the important role of religion in relation of humanity. The religion holds that stigmatization is identical to dogmatism, rigidity, excessive self-blaming and gender bias.

Malinowski as quoted Steenbrink (1988:23), argued that religion is as "-wishfull thinking"; Despite the conviction of religious truth are considered nil, but still capable of helping has a positive sense of frustrated and still potentially in realizing the social Union (religion as a societal glue). (See, 1998:187; Nottingham, 1997:31; Hidayat 2001:58; Shihab, 2000:58; Riyadi, 2006:59; Suseno, 2001:66).

In sociological, religious influences can be seen from two sides, namely that it has a positive influence or the influence unifying (integrative

factor) and the influence that is negative or the influence that is destructive and divisive (disintegration factor). The social role of religion as an integrative factor for society mean the role of religion in creating a shared bond, both among members of some communities and social obligation that helped unite them. This is because the values underlying social liability systems supported by religious groups so that religion guarantees the existence of a consensus in the community.

The function of the disintegration religion although it has a role as a unifying force, binding, and maintain the existence of a society, at the same time religion can also play a role as a force that scatters, divisive even destroy a society's existence. This is a consequence of so strong a religious group adherents binding in itself so often ignore even blame the existence of other religions. This article try to unravel over the problems of social-religious conflict in Indonesia a plural society, containing questions; (1) the plurality of Indonesia society; (2) how the understanding of religion generally; (3) what is the contribution of religion in addressing social problems in the life of society?, answer the problems above are certainly not easy, this is due to a conflict not only occurred on one for sticking to the surface of a conflict that could be exemplary causal interconnected have multidimensional. This article describes how to challenge the role of religion in a plural society and attempts compromise hope; How should religion "is present and there is" be the solution for the problems of the nation currently hold it rushes by the schisms and claims of truth groups.

DISCUSSION
The Plurality of Society Indonesia

There are several factors that cause the condition of the plurality of society Indonesia, namely: first, the geographical area of the State of Indonesia which consists of 3,000 less scattered islands along the equator approximately three thousand miles from East to West, and a thousand miles from the North to the South, a factor that greatly influence on the occurrence of the plurality of ethnic groups, religions in Indonesia. Opinions about how the real number of tribes that exist in Indonesia, there are various diverse opinion among scholars. For example the opinions expressed by Hildred Geertz (1982) for example, she mentions there are approximately 300 tribes who inhabited the regions of Indonesia, each with its own style and language diversity, the different cultural identities.

Second, which led to the existence of a plurality of Indonesia society is the fact that Indonesia is located in Indonesia between the ocean and the Pacific Ocean. These circumstances make Indonesia become the traffic trade, so strongly influenced the creation of the plurality of religious and ethnic plurality in Indonesia society. Geographically Indonesia is an archipelago country. According to the results of the identification of these islands has been done, there is much less 17,508 Islands throughout Indonesia. 7,353 island named island 10,155 and has not been named in the entire Republic Indonesia (Kaligis, 2003:8; Kahar, 2004:1).

Third, different climate and structure are not equal among the various regions of the archipelago, has resulted in a plurality of regional. The difference in rainfall and soil fertility is a condition that creates two kinds of different ecological environments, namely agricultural areas wet (wet rice cultivation) are particularly plentiful on the islands of Java and Bali, as well as the fields (shifting cultivation) are encountered outside of Java (Nasikun, 1984:10). This situation encourages the existence of exodus of people from one place to another with the hope of improvement of life. The plurality of religion or promoting diversity of religions is a fact of axiomatic (can not be refuted), and is a historical inevitability (historical necessary) that is universal.

The plurality of religion should be viewed as a part of human life, which can not be obliterated, but it must be addressed with tact. The plurality of religions, cultures and ethnic communities Indonesia on one side begets a potentially clash, conflict, violence, and the anarchist attitude toward other faiths, but on the other side of religion is unifying the nation rides.

Peace Education

Peace is meant as the absence of war or conflict and violence. Causative factors of the peaceful atmosphere is when an individual has a sense of peace in yourself, have the ability to control emotions and mind not to take actions that harm others and can trigger the onset of conflict and violence. According to Sahlan and Tine (2012:39), peace-loving is the "attitudes, words, and actions that cause others to feel happy and secure over the presence of himself".

Peace is a concept and a positive way of looking either to himself or to others. Peace can be defined in two sides; peace first "negative", i.e. the absence of war or violent conflict. This situation is achieved by the structural approach, namely the prevention of any potential conflict with the controlling parties who could ignite the potential conflict into open conflict and the use of force. Secondly, peace is positive, i.e. a prosperous

existence of freedom and justice, which formed the basis of the creation of a peaceful atmosphere in a community, see, Department of International & Transcultural Studies, *Fundamental Concepts of Peace Education,* Columbia: Columbia Univerity, 2006, p. 1; also Betty A. Reardon, *Comprehensive Peace Education; Education for Global Responsibility,* New York, Columbia University: Teacher College Press, 1988, p. 11-38

While the meaning of peace, as the core of peace, according to Ursula Franklin contends that peace is not merely the absence of war, but also the creation of Justice and a loss of fear in the individual and the community. The fear that question is the insecurity of the economic factors such as fear of no job or a decent place to live.

Franklin (1984), further highlighting the so-called "system that threatens", i.e. a system that was created by a group to control and regulate individuals or other groups by giving them the fear and uncertainty for the sake of achieving a particular goal. In other words, to create peace nor a peaceful life to do the effort to meet the sense of fairness and a sense of security of the individual or community, either a physical threat, safe from economic or other aspects of the threat. In addition, experts and practitioners of conflict resolution (conflict resolution) understanding of peace is not just freedom from war (absence of war) but includes the existence of economic justice, social and culture, as well as free from discrimination based on race, class, gender, and religion.

In Western literature, the term peace education materials into the discussion, which discusses and develops the idea of a peace education and action. There are some definitions expressed about education, peaceful version of UNICEF. UNICEF define peace education as the process of promoting the knowledge, skills, attitudes and values needed to bring about behavior changes that enable children, youth and adults to prevent (to prevent) the conflict and violence; resolve (to resolve) conflicts peacefully; and creating (to create) the conditions conducive to peace, whether at the level between personal, interpersonal, between groups, nationally and internationally, see Susan Fountain. 1999. Peace Education in UNICEF. UNICEF. New York, p. 1.) From this definition it can be concluded that peace education is the process of promoting the knowledge, skills, attitudes and values to prevent, resolve and create peace on every level.

The concept of peace education is a continuation of the commitment UNICEF about the vision of a quality basic education that emphasize there needs to be a process of education that teaches about the knowledge, skills and values regarding living and working together in a sovereign and participated in the construction. This can be seen in the agenda of The Future Global Agenda for Children – Imperatives for the Twenty-First Century in 1999, committed to ensuring that education and learning processes help to form 2 things: (1) human capital for economic growth and respect for the right of every individual to participate embodies the equation in family life, community and economy; and (2) against the culture of violence that is a threat that can destroy family life and community in many countries.

Aghulor and Iwegbu (in Babatunde Adeniyi Adeymi and Mujidat Olabisi Salawudeen (2014:187) added that peace education is a program to impart to the citizens about the relevance of peace, both in the context of the lives of individuals, communities and nationwide. Peace education is empowering community model seeking to resolve the conflict with its own creative way and without violence. The values that are enshrined in the peace education was mutual appreciate, love, fairness, justice, cooperation, and mutual tolerance, see the priest Machalli. Peace Education and the Deradicalization of religion. Journal Of Islamic Education. Volume II, number 1, June 2013. p. 45, Tricia s. Jones, as cited by Ahmad Baedowi, which defines peace education or education conflict resolution as "a spectrum of processes that 9. utilize the communication skills and creative and analytic thinking to prevent, manage, and resolve conflict peacefully" view Ahmad Baedowi, "Peace Education and conflict resolution for school," Media Indonesia, Monday, March 1, 2010).

Based on some of the opinions above it can be concluded the peace education is building self-reliance at the community to independently build a peaceful society and able to cope with any problems that arise. In other words, peace education puts the Community (or in the context of these learners) to become the main actors of the process of peace building and conflict resolution.

The Way of Religion; Between Intrinsic and Extrinsic

Current religious – often-encountered only as something that is utilized for various purposes. Religion is not for religious life guidance, just something to use but not to live. People turn to the Lord, but not turned away from himself. Religion is only used to support other motives; the need for status, a sense of security or self-esteem. Religion was just made of camouflage, he did not become a

spirit of change making a living and a life more meaningful. Allport in Rakhmat (2004:26) stated the way religion is like as a way of extrinsic religious and closely related to mental illness.

Religion from the normative point of view always teaches harmony, of love and harmony among believers, internally or externally. Internally manifest in harmony and tolerance among fellow believers and externally the existence of harmonious relationships among the adherents of other religions-. Malinowski as quoted Steenbrink (1988:23) say that religion is as "wishful thinking-" despite the belief of religious truth are considered nil, but still capable of helping has a positive sense of frustrated and still potentially in realizing social unity. In the language of Durkheim "religion as a societal glue" (see Rasjidi in Al-Djamiah, special number, may, 1968).

Intrinsically religion is a way of turning religion into a religious commitment is comprehensive and integrative driving, which governs the whole of human life. Glock & Stark (1996: 43) says in religious diversity contained several dimensions, one of which is the dimension of religious experience (the experience dimension or religious experience). One is religion used as alloying factors, synchronizer (unifying factor), which can establish the harmonization of the life of religious communities and nation as well as the spirit for the struggle paved the kinship, the unity of the nation.

Thomas Merton, in his book Mysticism in the Nuclear Age, said: "You can not bring peace without good deeds. You can not obtain a social order without the presence of the mystics, saints and prophets ". Opinion Merton showed that religious behavior prosecuted in accordance with the values of religion. It was impossible to present religion without form, without morality, piety act, because religion and act like a unified whole, are interwoven in the religious life of man. Erich Fromm (1972: 59) says that religion means alloy harmony between faith and human behavior that exists intact in all aspects of life that does consciously (free conscious activity).

In other words, religious activity not only occurs when a person commits ritual behavior (worship), but also when doing other activities are driven by supernatural forces. Not only with respect to activity that looks and eye can see, are also activities that do not appear to occur in someone's heart (For more details see Ancok and Suroso, 2008: 76).

Religion and Social-Religious Problems; Between Hopes and Challenges

The discourse of social problems is thrash out conditions that occur and affect human life where most of the problem was not liked by the people and even tried to eliminate, such as poverty, ignorance and backwardness. Social problems is a challenge that must be faced by living human beings, both individually and in groups so there is no inequality in society.

Social problems can occur due to several factors, among others, if the communication between cultures can not be realized in the life of a pluralistic society, while cultural communication is indispensable in creating a peaceful life. In connection with that, intercultural communication is required if: (1) There is a human mobility is increasingly unstoppable, (2), interdependence of nature, (3) Advances in communication and information, (4) There was migration and transmigration high enough, (5) political uncertainty and (6) If there are attempts to establish peace.

In the era of technological advances and communication, the role of religious groups should not be solely focused on the scope of internal people religionists, but able to reach people outside their religion. Society is constantly undergoing a process of globalization, lead to the transformation of communication and information which leads to changes in social values and culture, and others. And, when society has changed in receiving new values are obtained due to the free flow of information. In this condition, the religious community to experience the effect of free flow of information and they use it to deal with other religions, it is then a trigger collisions and frictions.

Seeing this phenomenon Hidayat (2001: 58), believes that the current basic function of religion experienced a deflection, reversal, ie the beginning serves as a human being to achieve goodness, religion has become a social reality and the teaching force people to achieve goodness, religion becomes the social reality and the teaching force people to follow and obey. Religion undergoing a process of objectivity, that religion has become very dry, formal, narrow and tight. Therefore, believers who have an attitude of diversity such becomes very sensitive, if the problem of confidence and belief in their religion undisturbed, if blamed or judged heretical by a person or a group of others, the attitude of this kind is highly prone to cause conflict between religious communities that could spread to all aspects of life.

Abdurrahman Wahid argued that the presence of religion as a "strategic point" by various parties in development, suggesting that the "role" is more superficial, or appear only on the surface. He further said that if that religion has played enough in our national development, why direction, insight and moral development itself strongly felt not

absorb religious values overall. Can not be denied, even religious values eroded powerful in this era of development. Consumptive life pattern that actually rejected any religion, it is growing, being offset by a sufficient ability to increase work productivity as a nation, thus encouraging more widespread and serious corruption (See Wahid, 1994: 3; Abdullah, 2001: 1).

In its development efforts to solve social problems-problems as mentioned above requires a normative and moral footing as well as ethical. Due in turn to the development undertaken must be based on recognition of the independence of even the glorification of a person or group to develop itself in accordance with the beliefs and identity and conscience whisper. Here, then, the religious aspect of religions plays an important role in development (Amin, 1989:8). If the core problem is the construction of social problems-problems to overcome, but the handling is often not about to touch the transcendental dimension of the problem of welfare and justice.

The existence of religion is supposed to be a "strategic point", which can be used by the various parties involved in the construction, such as the involvement of religious leaders in various aspects of development. Returns authenticate the message of religion as a cultural revelation that religion can be implemented in an ever changing world. Therefore, religion is often manipulated to confirm its existence with the past without responding creatively to the modern world.

Indeed, a religion that does not follow the meaning context will lose his existence were accommodating to changes. Is not, the agenda of religions since the beginning revealed is a dialogue with the social problems of mankind? Therefore, discussed religion with social problems is a necessity, because religion does not come from a vacuum. When religion is not delivered through the culture, it will trigger the emergence of ideology "false" against religion, religious attitude of excessive and radical. This happens because people are not taught to understand, but believe in a religion. Religion just became a symbol of existence, he was born not of a true reflection of consciousness, but rather an effort to strengthen the status quo of religion itself.

Awareness of each type of religion is not thought to lay the foundation for the community, the nation, the country and the culture of Islam, Catholicism and Protestant, Hindu, Buddhists and Confucians, but contribute thoughts and actions within the framework of a joint task to develop the society,

nation, state and culture that is based on Pancasila.

There are currently required of each denomination are their contributions on the one hand loyal to the faith believed by each denomination of religion and belief in God Almighty, on the other hand can be accepted by all classes in the framework of a joint task to develop the society, nation, country and culture that is based on Pancasila. Donations will be accepted not because of their contributions that come from the Muslim, Christian, Hindu, Buddhists, Confucians or faction of belief in God Almighty, but the contribution of these thoughts have the truth that the ultimate judgment of any grade (Simatupang, 1988: 51)

CONCLUSION

Based on the study above, it can be summed up as follows: First, in the life of this world, the plurality as a necessity even as the laws were deliberately created by God, by its should be recognized by everyone. With a plurality on the one hand as a treasury of wealth for a nation that could encourage people to compete in attaining goodness, although it is undeniable that the other side can also trigger plurality and create ongoing conflict if not addressed properly. As the consequence of a pluralistic nation like Indonesia, of course, not least social problems that appear on the surface that need to be overcome, here religion with noble teachings and plenary govern every aspect of human life can contribute in addressing social problems in question.

Second, the role of religious faiths, should not only be on the same religion, but to reach people outside their religion. Society is constantly undergoing a process of globalization, lead to the transformation of communication and information which leads to changes in social values and culture, and others. And, when people change and accept new values are obtained due to the free flow of information.

Third, the religious community needs to do more (because they generally have the ability to do so). That means requires the ability to adjust and cope with problems and conducive environment to support the development of social values and culture that responds to various changes. It had to happen, because of the social problems in / society (the context of the religious community is located).

Fourth, religion gives us direction in life, teach freedom, and deploy insight to keep our lives in peace. God is lowering religions, in order that we do not get caught and trapped social tension in relationships between our neighbor. Not also in relation of people of different religions. We did not want it to happen. So, there are some basic grounding that might free us from the trap of the tension. First: the wisdom to not highlight the

absolute truth of our religion as the realization that human beings have a relative and limited nature. By doing so, he could not reach the stage of absoluteness. The absolute truth of religion is required to be recognized in the community co-religionists. That is, the reality of everyday life, they are also hampered by a variety of doctrinal tension because of differences in interpretation, the meaning of the teachings, as well as religious aspirations among people of a very large and very plural. Second: God was revealed religion as a means of glorifying humanity. Glorified humanity (sympathize, give help, appreciate his insights) should be rated higher in social intercourse. Third: to develop the possibility of emergence of religion as an alternate value offer and the offer was not forced. Religion did not appear to rule or dominate, but to contribute in regulating life. Religion becomes the conditioning element in the association of socioeconomic and political. Through and in religion, we are looking for peace.

Efforts to realize a peaceful life is not an easy job, in addition to requiring human costs and expensive and requires a phasing process that took place in the span length. However, this does not mean the effort is not feasible, especially by those who are able to understand and follow the teachings of God and the laws that are loaded with the value of compassion, reciprocity, and togetherness in all aspects of life.

Consequently plurality in whatever form it takes, is the laws that must be respected. People may not agree with an ideology or unwilling to follow the cultures are different, but as long as this does not interfere with his identity, he must honor it, that is, everyone has the right to express themselves and are obliged to respect the expression of the rights of others in the order of a group that is fair and egalitarian. Therefore, diversity should be recognized as an opportunity to build a fair cooperation and mutual benefit for the realization of social interaction and dynamic nature. Teaching about the laws and reciprocity in this life is a form of Islamic education which is now known as peace education.

IMPLEMENTATION OF ONE-ROOF SCHOOL IN MOUNTAIN REMOTE AREA
(A CASE STUDY AT ONE-ROOF PUBLIC MIDDLE SCHOOL WLINGI BLITAR)

Mahura Mayangsari; Munawir Yusuf
Sebelas Maret University
Email: mahuramayang@gmail.com

ABSTRACT

Education equity program becomes the priority of Indonesian Government, especially in remote, scattered, and isolated areas. The Government's action in addressing issues of education equity in Indonesia is by the introduction of 9-years-learning-compulsory movement. In general, one alternative of 9-years primary education held in the remote, scattered, and isolated area, as well as away from middle school access is a cohesive primary education model that is implementation of One-Roof Middle School program. This study aims to describe the implementation of One-Roof Public Middle School Wlingi as an alternative of the 9-years education equity in a remote area located in Balerejo village, Wlingi, Blitar. The study employs descriptive qualitative as the research approach and type. Key informants as data source include principal, teachers, students, and society. Data collection procedures used in the study are observation, documentation, and in-depth interview by using unstructured interview guidelines. The collected data is then verified and analyzed through theoretical interpretation in order to understand the tendency of problems that arise. The study result that the implementation of One-Roof Public Middle School Wlingi has run in accordance with the objective since builded. Factors that demotivate the implementation of One-Roof Public Middle School Wlingi in Balerejo village, Wlingi are the economy, the insufficient facility and infrastructure, the lack number of staff sand teachers in quality that most teachers do not teach in accordance with their appropriate fields of study, the low motivation of the society in sending children to school, and the geographical condition. At last, the study offers a solution in order to improve the quality of education by increasing high attention, coordination, and commitment of the entire stakeholder as a moral obligation to educate the nation's children.

Keywords: one-roof school, education quality improvement.

1945 Constitution article 31 establishes education for Indonesians that all Indonesians are entitled to acquire education and have to take primary education. In a detail, in the Constitution No. 20 of 2003 about National Education System article 17, the primary education is in the form of Elementary and Middle Schools. Elementary school program is 6 years and Middle school program is 3 years. Therefore, the primary education program needs 9 years which then known as 9-years-learning compulsory of primary education program.

Indonesian Government Regulation No. 47 of 2008 on nine-years compulsory education article 2 explains that it functions to seek extension of opportunity equity in obtaining quality education for every Indonesians and aims to provide minimum education for them to develop their potentials in order to be able to live independently in society or to continue their education to a higher level. Implementation of nine-years-learning compulsory program will be able to overcome problems of equitable service distribution and education quality improvement which have not been completely well-implemented. That is because of the gap between the quality of education in rural and urban areas in Indonesia, especially in remote areas.

One alternative of primary education created by Government in order to succeed the nine-years-learning compulsory program in remote and away from middle school access areas is generally an integrated primary education model of Elementary-Middle School which is the implementation of one-roof school. The integration could refer to physical and or managerial. Physical cohesiveness is the location of Middle and Elementary School which is joined or juxtaposed(DediKoeswara, 2012:2).

General objectives of One-Roof Elementary-Middle School developmentare to accelerate the nine-years-learning compulsory of primary education and improve the quality of primary education. Whereas, particular objectives of One-Roof Elementary-Middle School are: 1) to enlarge

primary education service or improve Middle School capacity in remote, scattered, and isolated areas in order to support accomplishment of nine-years-learning compulsory; 2) to juxtapose Middle and Elementary School, as well as provide opportunity and chance for children to continue their education; and 3) to improve participation of society (Implementation Guide of One-Roof Elementary-Middle School Development, 2008:1).

The establishment of one-roof school aims to place alongside Middle School education institution to the most accessible place for public with expectation of primary education fulfillment for surrounding society. Economic level of the society where One-Roof Middle School is implemented is categorized at low level. Therefore, it is less possible for parents to send their children to nearby Middle School because the distance is far from home and the fees are expensive.

The implementation of one-roof school program as a form of equity policy application of nine-years primary education cannot be separated from variables – supporting variables of the program are regulation, bureaucratic structure, implementers attitude, stakeholders, leadership, communication, resources, economy, social, management strategy, monitoring and evaluation (Edward, 1980; Dunn, 1981; Winarno, 2002; Brienkerhoof& Crosby, 2002; Hasan, 2013).

In this study, the supporting variables covered are bureaucratic structure, resources, and communication; therefore relation between the three things in supporting the implementation of one-roof school program needs to be described.

METHOD

This study is a descriptive qualitative research. It aims to describe and summarize a variety of conditions, situations, and phenomena of social realities that exist in society as research object, and/ pull the realities out to surface as a trait, characteristics, nature, model, sign, and picture of a certain condition, situation, or phenomenon (Burgan Bungin, 2009:68).

According to Marshall &Gretcher, in a qualitative research, data collection is done at natural setting, by using primary data source, and data collection techniques are more on participant observation, in-depth interview, and documentation (Sugiyono, 2012:309).

The study is focused on the implementation of One-Roof Public Middle School Wlingi as an alternative of the nine-years education equity. The focus of the study is the process of a program implementation which is bureaucratic structure, resources, and communication in May 2016. Data collection procedures of the study are observation, documentation, and in-depth interview using unstructured interview guidelines. Main instrument of the study is the researcher. Key informants as sources of data include principal, teachers, students, and society. Data analysis of the study is Interactive Analysis which is data collection, data reduction, data display, and drawing conclusions or verification. Data validation of the study is triangulation.

FINDINGS AND DISCUSSION

Blitar is one of areas that implement one-roof school. One-Roof School in Blitar is supported by Australia with self-management or given to school management system (Blitar website, 2016). The following table covers data of Illiterate Rate and Gross Enrollment Ratio (GER) in Blitarat 2006-2010, data source of RJMD Blitar 2011-2016.

No	Description	Year				
		2006	2007	2008	2009	2010
1.	10-44 y.o. Illiterate Rate	8.677	7.576	700	0	0
2.	Gross Enrolment Ratio (GER) : - Elementary school - Middle school - Highschool	96,55 85,64 23,16	97,14 95,23 26,34	97,38 95,65 26,46	98,04 96,29 34,18	98,62 99,07 38,68

Based on the data of Blitar District Government, Gross Enrolment Ratio in 2010 at Elementary School level is 98.62% and Middle School level is 99.07%. Gross Enrolment Ratio (GER) from 2006 to 2010 continuously shows improvement although it is relatively small. However, there are still numerous efforts that have to be implemented in order to make GER of education, particularly secondary education (Middle-High School), increases.

Blitar has 4 schools that implement one-roof school. One of them is located in Balerejo village Wlingi district, namely One-Roof Public Middle School Wlingi. Geographically, Balerejo is located in mountain area in which its nature condition is

less motivating for the society to easily get education access. BlitarGovernment of Education implements one-roof school located in BalerejoWlingi in 2009 based on decree of one-roof school implementation number 188/89/409.012/KPTS/2009 issued by the Regent of Blitar with a land area for building of 3524 m2. One-Roof Public Middle School Wlingi was located in the same place with Public Elementary School Balerejo 1. In 2010, because the number of students at Public Elementary School Balerejo 1 was small, the Blitar District Government decided to incorporate the students of Public Elementary School Balerejo 1 with Public Elementary School Balerejo 2. Thus, the location which originally included Elementary and Middle School becomes Middle School location only. The principle manager would have fundamental reasons in determining the location of which the principle is implemented as an alternative to resolvethe dropout rate in Balerejo and the surrounding.

Vision of One-Roof Public Middle School Wlingi is that "The learners with belief, knowledge, achievements and skills of Indonesia", in order to achieve the vision, missions needed are as follows: 1. Organizing Education Service that is innovative, creative, transparent, and accountable; 2. Growing Comprehension and Implementation of Doctrine adopted and Cultural Values; 3. Growinga spirit of excellence structurein science, technology, arts, and sports; 4. Growing polite behavior and noble personality; and 5. Developing competitive Local Specialty Based Competency.

Number of students at One-Roof Public Middle School Wlingi in the academic year 2015/2016 is 150 students consisting of 78 boys and 72 girls. There are 6 study groups which are 3 groups of grade VII, 2 groups of grade VIII, and 1 group of grade IX.

One-Roof Public Middle School Wlingi has 14 educators, which are divided into 1 principal, 4 official teachers, and 9 honorary teachers. Curriculum carried out in 2015/2016 at One-Roof Middle School is K2006.

Bureaucratic Structure of the Implementation of One-Roof Public Middle School Wlingi

Bureaucratic organization has a standard, formal, and long-period hierarchical structure which is characterized by routinely operational tasks achieved through formal specialization and rules as well as arrangements. Bureaucratic strength lies in the ability in running a program efficiently (Weber, 1948; Robbins, 1998;Hasan, 2013).

Bureaucratic structure in the implementation of One-Roof Middle School cannot be separated from the discussion of bureaucratic concept. The One-Roof Middle School implementation of the site study has implemented the bureaucratic structure theory. The implementation is in accordance with the school conditions.In addition, the Principal leadership factor also determines the implementation of school programs by implementing a democratic situational approach to create conducive school conditions. Although with all limitations, the bureaucratic structure is implemented and runs effectively and excellently.

According to Bollen (1997), human resource empowerment efficiency is conducted based on the limited school conditions to achieve an effective school. The Principal generally employs field approach as an effort to support the implementation of One-Roof Middle School that is by organizing school in accordance with the school environment conditions for the effective and excellent implementation of education.

Implementation guidelines or operational standard of One-Roof Public Middle School Wlingi has referred to the activity operational standard. The Principalinvolves all components of school in the implementation of school program, distributes teachers' tasks in detail with clear job descriptions, and completely trusts the teachers in the implementation of school program.

Coordination within the bureaucratic structure has been employed well. It is employed every time, routine and scheduled. Coordination with the Blitar Government of Education is done intensively and regularly. Coordination with the school committee is done proactively.

Human resource empowerment is based on the ability and commitment with responsibility. There is no difference between the official and honorary teachers in the tasks distribution. In the implementation of school program, the Principal distributes the tasks along with the vice principal, school treasurer, homeroom teachers, and extracurricular instructor.

Educational Resource

In the implementation of one-roof school program, quality resources are needed in order to make the implementation process be properly conducted and appropriate with the objectives of implementation. Availability of educational resources is one of important supporting factors in the realization of education program implementation. Resources in the implementation of one-roof school consist of human resource, facility and infrastructure resources, and budgetary resource.

In term of quantity, total number of official teachers is 4, while others are still honorary. In term of quality, some teachers teach subject which is not in accordance with their educational background. In order to improve the professionalism, teachers are participated in forum of Subject Teachers Council activities and training from the Government.

One-Roof Public Middle School Wlingi does not have education officer that helps the efficient process of the school implementation such as administrative staff, laboratory staff, security, medical staff, and librarian. The school administration is done jointly by the Principal, vice principal and teachers outside of school hours. Because of that limitation, the Principal and teachers are required to be more creative and innovative in the school implementation.

The buildings for learning process area, teachers' room, Principal's office, administrative room, living room, and laboratory are quite representative. Sanitary toilet is available only for students, but not for teachers. Learning infrastructure, such as library, is not available. Book resources to improve students learning are still in a small number. Availability of laptops or computers is still limited, either for supporting IT subject or for the importance of school administration.

One-Roof Public Middle School Wlingi has implemented education for free. Main source of school funding is from the Government, such as BOS and Scholarships. Special Allocation Fund is given in the form of school supplies, such as skill tools, sport equipment, science laboratory equipment, and furniture. Payment of GTT Teachers Salary is done by the School.

The combination of educational resources to support the implementation should be provided together. Therefore, the implementation of one-roof school achieves effective school objectives. Thus, the existence of education resources is not only the responsibility of the school Principal but also all parties.

Communication

Communication is a process of delivering information in the form of message, concept, or idea from one party to another. It is done in order to make coordination of implementation between principal, teachers, staffs, and society runs smoothly. It can be done in both formal and informal according to the necessity.

Communication of One-Roof Public Middle School Wlingi and nearby Elementary Schools runs smoothly. Documentation of Elementary students who is going to assign from Elementary to Middle School is held annually. Additionally, One-Roof Middle School conducts socialization to the other nearby Elementary Schools regularly in order to obtain students. Selection test of the assignation level from Elementary to Middle School is not employed.

Structurally, One-Roof Public Middle School Wlingi is directly under the District Government of Education. Communication with Education Officer of Wlingi is only coordinative. The communication is in the form of proposals or reports of regular school expenses and so on.

Communication aspect of One-Roof Middle School and the surrounding society, directly or indirectly, runs smoothly. The society kindly accepts the existence of One-Roof Middle School. Informal communication is done in social and religious activities.

Communication generally runs effectively and efficiently. That is because of the Principal leadership, teachers, and a conducive school condition implication. It has a very important role in supporting the success of school implementation. Moreover, it is one of factors which determine the school development to be an effective school. In accomplishing various tasks, many regulations have to be created. Communication is used to spread information and procedures professionally and cooperatively in meetings in order to create a good professional relationship between school stakeholders.

Communication has four main functions in an institution or organization,

which are as a rein (control, monitoring), motivation, emotional expression, and information (Robbin, 1998). Communication in the implementation of One-Roof School is well functioned toward the targets with positive communicative. The limited conditions do not affect the implementation of One-Roof Middle School Wlingi. Therefore, communication affects the implementation of one-roof school to achieve the main objective of nation education equity.

Problems Faced and Alternative Solutions Offered

Economic factors, namely school fees that are considered expensive, low-income parents, and most children work to help their parents' work. Therefore, alternative solutions are socializing to the parents and surrounding society that One-Roof Middle School is free of school fees and allowing the students to help their parents' work (for example: when harvest season comes).

Problems in the facilities and infrastructure preparation are that the school does not have library, has a small number of book resources to support students learning, and has limited numbers of laptops and computers. Thus, the alternative solution is that the school manager should immediately provide the classroom facilities and infrastructure through proposals for social support.

Problems in the lack amount of educators and many of them do not teach accordingly with their fields of study. Hence, the alternative solution is that the Government should immediately improve the lack amount of educator.

Problems in the development of human resources, particularly administrative staffs without certificate or diploma of administrative expertise and educatorswho are assigned to teach two subjects concurrently. Thus, the alternative solutions are that the central Government, local Government, and One-Roof School developer conduct training for the administrative staffs and add some qualified administrative staffs. While for educators, the Government and developer could re-record teachers who teach in One-Roof Elementary-Middle School and assign them in accordance to their expertise.

Socio-cultural factors, namely the low support of parents, people are still less active in improving the education in their area, low learning motivationof children and low-level education of parents. Thus, the alternative solutions are that the school and society leaders empower the surrounding society and strive for meeting procurement by inviting all committees and related leaders.

Geographic factors, geographic location of Balerejo is in the mountain with hilly condition and minimal road infrastructure which result a longer travel time to go through for the teachers and students to go to school. There is no public transportation operated which results the students who do not have personal vehicle had to walk to go to school. Therefore, the alternative solutions are that the school should give different authority from regular school for the school time to begin at 07.30. In addition, the local Government and school developer should strive for developing boarding facility for the students and teachers who live far away from school.

CONCLUSSION

The clear standard guidelines, intensive coordination, and appropriate human resources could achieve effectiveness of the implementation of One-Roof Public Middle School Wlingi. It is also supported by intensive communication of the education stakeholders.

The teachers are required to always stimulate the education creativity and innovation in accordance with the challenge of teaching workforce professionalism, particularly in the field of One-Roof Public Middle School in remote areas. The principal should implement the bureaucratic structure which is simple and easily understood by all school personnel.

The District Government of Education does not need to apply acomplicated bureaucratic system and has to pay attention, records, and equips the lack educational resources in remote areas. Thus, it is expected that the quality of education could be improved by increasing high attention, coordination, and commitment of the entire stakeholders as a moral obligation to educate the nation's children.

THE CRITICAL ANALYSIS OF SCHOOL BASED MANAGEMENT POLICY TO BE AUTONOMOUS SCHOOL

Maryono; Ainur Rifqi

STKIP PGRI Pacitan, JawaTimur, Indonesia

e-mail: gusmaryono56@yahoo.co.id.

ABSTRACT

Education and culture are mutually synergized. They are improving and balancing the human dignity and universe creator. Based on the researcher's search, the issues of autonomous MBS (School Based Management) policy has not been widely discussed by other researchers. To get a comprehensive study, the researcher used some phases. To acquire trustworthiness, the prerequisite should be attained. To get the data credibility used triangulation. MBS provides widest autonomy for principal, on organizing education, programmable, scalable, and other right tracks. MBS easily designs learning processes related to the schools' condition. National Education Standards Achievement through MBS leads autonomous school being improved.

Keywords: *school; mbs (school based management); autonomous; policy*

Education is transferring knowledge, value, culture, and religiosity which directed toward humanizing. The essence of this education process is as an attempt to change the behavior of individuals or groups that have values that are agreed upon by the religious, philosophical, ideological, political, economic, social, cultural and defense and security. In conformity with Paula Freire, education is the process offorming cadres in which theessential purpose is for liberation. The essence of education is the ability to educate self. In Islam, the essence of education is to take the values of the divine in human (nature) within the guidance of the *Qur'an* and *Assunnah* (Hadith) to become good character human (perfect man) thus the essence of education is largely determined by the values, motivations, and intentions of education itself. The essence of education can be formulated as follows: (1) education is a process of human interaction that is characterized with the balance between sovereignty of students to the authority of educators; (2) education is preparing students to face a business environment that is changing rapidly; (3) education to improve the quality of personal and community life; (4) education lasts a lifetime.Education is an issue in applying the principles of science. A father will attempt to educate their children by simply guiding and training his son to know the life of the forest such as: recognizing edible fruits, making animal traps and so forth (Jalaluddin, 2001: 67).

Another opinion states that, "Education can be interpreted simply as a human effort to develop his personality in accordance with the valuesof society and culture. In addition, Ki Hajar Dewantoro interpreted education as an attempt to advance the education of character, thoughts and child bodyin order to promote the fullness of life and turn the child in harmony with nature and society. Furthermore, in his book "Education Platform" Made Pidarta concluded that, "Educating intends to make people become more perfect, making human life increased from natural life tobe civilized. Educating is to cultivate human (2003: 2). From some of these statements, they deduce meaning or nature in general education from the standpoint of the history of human civilization since its inception. Furthermore, along with the development of human civilization to modern humans; the education become more organized than that initially limited to individual parents to educate children or society to preserve their cultures.To support this statement, Jalaluddin (2001: 68) states parents also give attention to children as well as young people in their community.

Education lasts a lifetime, or better known as long-life educationis accordance with the opinion of Richy in the book "Planning for Teaching and Introduction to Education" which has been translated and uploaded in http://file.upi.edu/ Education is a process that is more extensive processes than that take place inside the school. Education is an essential social activity that allows complex and modern society. This function of education is in the process of specialization and institutionalized by formal education, which remains associated with the process of formal education outside the school.

DISCUSSION
Mbs Management Implementation

MPMBS (School Based Quality Improvement Management) can be interpreted as a management model that gives greater autonomy to the principal, the flexibility to schools, and encourage participation in person the school community and the community to improve the quality of schools based on national education policy and applicable legislation (Nurkholis, 2003: 107) , cf. also Ministry of Education, 2002: 3). MBS is part of the School Based Management (SBM). MBS aims to improve all school performances (effectiveness, quality, efficiency, innovation, relevance and equity as well as access to education), then MBS is more focused on quality improvement (Ministry of Education, 2002:3-4). School autonomy is the school authority to regulate and manage the interests of the school community in accordance with the laws and applicable regulations of national education. The purpose of MPMBS is autotomizing or empowering schools through the granting of authority (autonomy) to school, giving greater flexibility to schools to manage school resources, and encouraging the participation between the school community and the community to improve the quality of education (Ministry of Education, 2002: 4).

Based on the field research, the application of MBS is as a model of strategic management in the education system management within the aim to achieve quality improvement of education standards. But in its implementation appears some obstacles, among others; low quality of education remains problematic at every level of education and education units, especially uneven primary and secondary education. It is seen from the quality of education in urban areas which shows very satisfied quality improvement, while in the rural area is still very of concern. Various attempts have been made by some institutions to improve the quality of education indiscriminately, both in urban and rural areas, among others; training and qualification improvement of teachers, provision and improvement of facilities or education infrastructure, and improving the quality of school management. Based on these facts, it is necessary for improvement efforts, one of which is now being developed by the reorientation of the educational operation, through school management (School Based Management).

Since the MBS program (School Based Management) was initiated in early 2001, this program will empower education stakeholders to give attention and care for education, especially school. In applying the concept of MBS, it requires school to form the School Committee in which the membership is not only the parents of students studying in these schools, but also teachers, students, community leaders and governments around the school and even entrepreneur. The emergence of this program is triggered by dissatisfaction or swelter of education managers at the operational level on the limited authority they have to manage schools independently. Generally, it is seen that the principals felt helpless being stuck with excessive reliance on an educational context. As a result, their primary role as educational leaders increasingly dwarfed by bureaucratic routine that causesdull creativity to innovate.This program is very good, as a form of government responsibility in education, so that it can assist in helping the community care for education financing. However, the discourse developed is the "Free School" so as to bury the public awareness of the education that has been built in the MBS.

From the above discussion, few schools of school committee and educatorsunderstanding are still lacking, consider such as BP3, so the determination of educational accountability through the role of education stakeholders is decreasing. It is no wonder that many schools were damaged, decayed, collapsed even allowed by the school committee, hoping savior to come, namely the government. In terms of macro management, education still has some problems. Management education in particular education units (schools) are under the authority of the principal. Similarly, the operation of education in the classroom should entirely be the authority of the teacher. Based on his professional authority, the teacher is in charge of planning, implementing, and measuring learning outcomes.

Pertaining to the evaluation of educational policies, autonomy era is still unformatted clearly which triggers variety of methods and ways of implementing the program to improve education. Until now the result of the policy is not visible, but a variety of improvisation in the area has shown better color. For example, some steps of the program that have been run in several areas related to education policies in order to improve the quality of school-based and community-based education quality improvement is implemented as follows: (1) the effectuation of UAS (Last Semester Test)and the UAN (National Examination) as a substitute of EBTA/EBTANAS (Last National Study Evaluation); (2) on the establishment of the School committee as a replacement BP3; (3) local content and the skillhave been applied in junior high school; (4) the abolition of the canonizationsystem in enrollment; (5) provision of incentives for state teachers; (6) the support of schools operational

fundingand school practice equipment; (7) help to increase human resources as an example of scholarships for teachers to follow Post graduate program.

Implementation of the education policy autonomy in the context of regional autonomy is as the following, such as: (1) generally, education autonomy leads toward improving the quality of education in response to our "mistake" for more than 20 years of struggling with the problems of quantity; (2) on the side of local autonomy, decentralization of education leads to the depletion of the central government authority and the regional authority bloats, over the government field labeled education must be accompanied by the growth of empowerment and community participation; (3) there is a potential tug of war between the autonomy of education in the context of regional autonomy in putting economic and financial interests as a force of attraction between the autonomous regional governments and educational institutions; (4) clarity site for educational institutions need to be formulated so that the autonomy of education can be run on the rails; (5) the level of schooling, educational autonomy acts upon the principle of decentralization and School Based Management (SBM) at primary and secondary levels; institutional arrangements at the level and the place which is a key success factor educational autonomy; (6) it is appropriate if the autonomy of education must be coupled with policy accountability, especially with regard to the funding mechanism or education funding; (7) at the level of higher education, an autonomous policy remains within the framework of scientific autonomy; (8) in the context of decentralization, higher education autonomy can not be solely placed on regional interests but on the fact that higher education is a national asset; (9) macro; whatever contains in it, the autonomy of higher education should highlight the excellence.

MBS is seen as an alternative to the general pattern of school operation that all this time had centralized authority at the central and regional offices. MBS is a strategy to improve education by delegating significant decision-making authority from the central and regional level to the school. Thus, MBS is basically a management system in which the school is an important decision-making unit for organizing education independently. MBS provides an opportunity for greater control of the principal, teachers, students, and parents on the process of education in their schools.

For this approach, the responsibility of certain decisions regarding the budget, staffing, and curriculum are placed at the school level and not at the regional level, or even the center. Through the involvement of teachers, parents, and other community members in the important decisions; MBS is seen to create an effective learning environment for students. Thus, basically MBS is the school's independence efforts with empowering it.

Implementation of effective MBS specifically identify some of the specific benefits which are: (1) allowing the competent people in schools to take decisions that will increase learning; (2) providing opportunities for all members of the school to be involved in important decisions; (3) encouraging the emergence of creativity in designing learning programs; (4)redirecting the available resources to support the objectives developed at each school; (5) producing a more realistic budget plan when parents and teachers are more aware of the financial situation of the school, spending limits, and the cost of school programs; (6) increasing the motivation of teachers and developing new leadership at all levels.

MBS is also seen to improve student learning achievement if the management is focused on school education rather than at the regional level. The principals tend to be more sensitive and know the needs of students and school rather than the bureaucrats at central and regional levels. Further, stated that a good education reformation will not be successful if the teachers who must apply it have no role and plan.Models MBS which is meant here are models of SBM applied in some countries. The emergence of MBS models in each country can not be separated from the history of education in the country. There were weaknesses in certain fields which focused on improved performance (Nurkholis, 2003: 86-111).

MBS model in Indonesia is called School Based Quality Improvement Management (MPMBS). MPMBS can be interpreted as a management model that provides greater autonomy and flexibility to the schools, encourage direct participation of people in schools and communities to improve the quality of schools based on national education policy and legislation. Autonomy of schools is the school authority to regulate and manage the interests of the school community in accordance with the applicable national education Act and regulation. Meanwhile, participatory decision is a way to take decisions through the creation of an open and democratic environment where the school communities are encouraged to become directly involved in the decision-making process that can contribute to the achievement of the school objectives. So, the school will be expected to be autonomous with the following characteristics: level of independence is high, adaptive, anticipatory and proactive, having a

strong control on the input management and resource, having a strong control over working conditions, a strong commitment and achievements are reference for the assessment and evaluation. MBS models in Indonesia are focused on quality improvement.Education within the framework of the struggle for independence were indicated by the emergence of education movement pioneered by Muhammadiyah University, Taman Siswa University, INS Kayutanaman, Ma'arif Education and other Islamic universities.

Education in Indonesia after Independence

In the period 1945-1969, the goals of the Indonesian national education, as stated in the decision of the Minister of Education, teaching, and culture (PP and K), Mr. Suwandion March 1, 1946, the national education goals in the early days of independence greatly emphasizedon the cultivation of patriotism. In Constitution No. 4/1950, the basis of education and teaching in schools were based on the principles contained in Pancasila, the Constitution of the Republic of Indonesia and the basic principles of the Indonesian culture. The formulation was repeated in Constitution No. 12/1954 which applies to the entire territory of Indonesia.The changes in national education goals impliedfor the curriculum change what was then called the lesson plan. The curriculum which was originally oriented to the interests of the Dutch Colonial modified according to the needs of the Indonesian nation that has been independent. The school curriculum in the early days of independence and 1950s aimed at: (a) increasing awareness of the state and society; (b) increasing physical education; (c) enhancing the character education; (d) paying attention to the arts; (e) associating the content of the lesson with daily life; (f) reducing the mind education.

Schooling system prevailing in Indonesia in the early days of independence includes three levels: low education, secondary education and higher education. The school system continues to be maintained until the 1980s. The end of the 1960s, even if changes occur, it is more on the institutional form. For example the abolition of the SGB, SGA transforms into SPG, and more development of other types of vocationalschools. After prevailing of Constitution No2/1989, there was amendment to the national education system, among others, that basic education is general education of which the period is six years in elementary school (SD) and three years in junior high school (SMP). Thus, SLTP is a general education; as a result the first vocational schoolis merged into SLTP. Another

noteworthy development in the era of 1945-1969 was the establishment of 42 Universities in the form of universities, institutes, and colleges which are generally located in the province capital, so called "new era of PTN (state university) growth".

Implementation of MBS toward Autonomous School

Implementation of MBS in various countries based on the above description has shown changes in the decentralization of education. As research result of Bandur in Flores, Indonesia (2008: 217), "First, school stakeholders have significantly higher degrees of decision-making authority than what they have enjoyed prior to the implementation of SBM. In turn, a process of changes has occurred in schools, Including the changes in the nature of the decision-making process that require all school stakeholders, collaborative relationships, and higher levels of parental and community participation. ".Some of the impacts of MBS implementation policy is making about the management of schools to consider and adjust the potential of schools through collaboration, participation, and empowerment of school elements (principal, teacher, student, staff), parent, school committee, community member, stakeholder, government (Bandur 2008; Pitoyo, 2003)." The criteria for selection of schools in any expansion of school-based management should include leadership and management capacity of principals, strong relationships with staff, and that the school is consistently tracking up in terms of its results… "(NSW, 2012: 74-76).

School-based management provides the school flexibility to organize school operations autonomously. Osario et al. (2009: 4) identified several activities that can be carried out independently by the school in the context of MBS, the budget allocation; the appointment and dismissal of teachers and other school staff; curriculum development; procurement of books and other educational material; improvement of school infrastructure; and monitoring and evaluation of teacher performance as well as student learning outcomes.Schools can set the appropriate school of innovation and creativity (Wu & Po, 2013) so that the school can improve academic performance (Bandur, 2018; Maryono, 2015). The independence of schools in MBShas great opportunity tobe enhanced by giving authority to the school (teachers) to develop curricula based on the local needs, national and international students to develop themselves in the intellectual, emotional and spiritual. (Hakim, 2010), supporting factor for school committees in playing their roles to support educational process cover the mutual cooperation and communication between the school committees and the schools and the availability of funds to finance the educational process at schools (Pitoyo,

2013)."In order to achieve the targets set out in the development plans, schools must first have a full understanding of their own objective circumstances and analyze the situation before formulating their development plans. "(EMB, 2006: 25-26).

School-based management, also referred to as local management for self-management, is a feature of the school movement around the world. "There is a strong association between the knowledge and skills of staff and learning outcomes for pupils, so schools will employ their capacity for self-management to design, select, implement or Utilize professional development programs to help the ensure of these outcomes."(Volansky& Friedman, 2003: 107).Self-management, reflection and self-evaluation of school are very important to analyze the success rate of the MBS implementation. To improve the quality of education,the decision quality made by the school should manifest the aspirations and opinions of the schoolcommittee and the stakeholders in improving the quality of education. Standards achievement through MBS National Education toward autonomousschool must always be improved through public disclosure, the disclosure to all parties, expanding the network for advantageous cooperation, creative innovative activities resulting in labor productivity and work through strategic work plan which is measurable and clear.

CONCLUSION

The autonomy given to school is the authority to regulate and manage the interests of the school in accordance with the regulations and legislation (Act) in the National Education System; b) Decision-making is carried out by a school participatory decision-making through the creation of an open and democratic environment; c) Citizens schools are encouraged to be involved directly in the decision-making processes so that the school community can contribute to the achievement of the goals of education in schools; d) MBS can provide empowerment to school, greater flexibility in managing school resources, encourages the participation of the community and school members in improving the quality of education; e) Management of schools that have been carrying out MBS will be able to encourage the school community to participate to make an independent school; f) Independence of school can be promoted through school self-management, self evaluation, self reflection based on the strategic plans of the school steady and measurable.

UTILIZING OF FACEBOOK TO IMPROVE STUDENTS' WRITING SKILL

Masykur

Universitas Wiralodra

Email: Aceng.masykur@yahoo.com

ABSTRACT

This paper reports on the investigation of the implementation of Facebook as a social networking in teaching writing to students of Wiralodra University. Facebook as a social networking enable individuals to connect to each other to form online communities. Lampe et al. (2007) note that Facebook provides a base for learners to check on their action, ideas and interest of the group they belong to. Similarly, Shih (2011) and Roblyer et al. (2010) found that Facebook allows learners to interact and collaborate. Facebook enabled the students to: (1) have a fun learning environment; (2) write easily; (3) get feedbacks from lecturer and peers; (4) discuss more with friends and lecturer outside classroom easily; (5) access more reference for students' writing; (6) get more motivation to write; (7) have their personal space to read and write in a community; and (8) build their analytical and critical thinking skill. Overall, the use of Facebook created positive effects to the students' writing fluency. For that reason, Facebook is recommended to be used as writing media for students. The research method used in this study is qualitative. Additionally, the data in this study were derived from the online interaction and scores of the students' writing on Facebook and interview. The participants in this study were the first semester students because in that semester are already familiar with the Facebook. The result showed that utilizing social networking especially facebook had a positive impact on 84% of the students, 64% could turn to other resources very easily if they faced any difficulties in understanding the subject, and 63% of the students improved their writing skills by using social networking. Therefore, this research aims to bring awareness on how the facebook can be utilized to improve students' writing skill.

Keywords: *social networking, facebook, writing skill, interaction.*

The use of social networks is a growing phenomenon in both private and academic life. Social networks refer to tools used to enable users for social interaction. The use of social networks complements and enhances teaching in traditional classrooms. For example, YouTube, Facebook, Twitter, and blogs provide a huge amount of material on a wide range of subjects. Students can therefore turn to any of these tools for further explanations or clarifications. Virtual tools, such as Moodle/Sloodle, helps students to keep in touch with their classmates and lecturers/instructors in a participatory environment in which these tools help the material taught to become easily accessible to all users at anytime and anywhere. In this environment users, and especially students, can ask or post questions and queries and they will be answered by their fellow classmates or lecturers/instructors.

In addition, lecturers can have a great time grading quizzes and exams. They can measure class participation in this way and give comments on any subject for the purpose of teaching and spreading knowledge. Facebook, Twitter, and other tools can be utilized in a similar way. Many other Social Networking tools, such as collaboration, online surveys, crowd sourcing, bookmarking and citation, document sharing, and online storage, can be employed to enhance the education process in a way that was not possible before.

The attributes comprised the projection of English by focusing on four skills (reading, listening, speaking and writing). Writing remains an important skill and being able to write well is definitely an added advantage for students. Also what is emphasized is the use of social networking in the classroom to change the pedagogical practices and to ensure 21st century readiness for every learner. As such, there is a considerable alignment between the use of social networking and language learning, particularly in the area of writing, which provides the focus of this study.

Writing as predominantly a cognitive activity tends to be lonely, brain bound and an internal affair (Nishino & Atkinson, 2015). It is said to be a difficult skill for ESL students to master as it is a complex, laborious, boring and uninteresting task (Warschauer, 2010). This implies that writing instructions should help ESL learners to organize their ideas, revise and review

techniques that get them to start writing and should not only focus on accuracy, sentence structure and grammatical aspects that are pre-planned. As language lecturers, students should be given an opportunity to voice ideas, knowledge and provide them opportunities to become confident writers. Thus, the general agreement that writing is a challenging task has led researchers and practitioners to seek ways for effective teaching.

The education world is moving toward the use of technology in education. Lecturers can no longer shy away from the digital world. There is a cycle of change due to the Internet and Information Technology (Kajornboon, 2004). The use of social networking is very popular among English language learners. According to Srinivas (2010), social networking is one tool which can assist lecturers and learners to access information and facilitate the learning of English.

Social networking sites such as Facebook can help lecturers to create a conducive environment for students to practice their writing skills and overcome the difficulties in writing (Carlos et al., 2015). Writing will be less burdensome with the online platforms as lecturers and students are able to interact, collaborate and work at their own pace outside the classroom hours (McCarty, 2013). In fact, researchers have highlighted that Facebook has the potential to motivate and encourage students to learn English well (Omar, Embi & Yunus, 2012). At this point it is important to acknowledge Facebook has many features that can be utilized in language learning, such as Like, Chat room, Comments, Notifications, Messages, News Feed, Events, Groups, Apps, Friends and etc. To use Facebook as a writing platform, one needs not necessarily use all features, it is enough to accomplish the task planned. In the case of utilizing Facebook to investigate the writing approaches, it is sufficient to use features such as Groups, Comments and Walls alone. Only a few features are used to accomplish a simple writing task. E-BizMBA (2013) has reported the most popular social network is Facebook, with an estimated of 750 million visitors each month. Therefore, lecturers ought to follow their learners and launch their courses into the virtual world. This research has focused on utilizing of Facebook to assist interaction among peers and lecturer in the writing of English. The participants

(subjects) are first semester English students in the Islamic education Faculty of Wiralodra University.

In the few past years, there has been rapid growth in the availability and uptake by many colleges and universities of teaching their courses to their students online, and the effectiveness of learning by using different social networking tools has increased due to the increase in provision of these electronic courses for students. As the world has changed from earlier ages to today's highly technological world, learning has also changed from the traditional classroom methods of learning to distance learning, and now to online learning. With the increasing popularization of computer technology, the way of classroom teaching has also changed from plain lectures to multimedia presentations. Also, with the technological advancement and the Internet, the world has become a vast storehouse of information (Tham & Werner, 2005).

Online learning (or E-learning) provides many opportunities that were not possible before and opportunities to learn from a reputable university or from across the state or country can be extremely valuable. Social networks for learning are social structures consisting of nodes that represent relationships between individuals (or organizations) within a certain domain (Liccardi et al., 2007). Ellison (2007) defines social networking sites as "web based services that allow individuals to (1) construct a public or semi-public profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system" (Ellison, 2007). Social networks are not used for communication only, but are used in education too. Typically, intuitions, colleges, and universities are taking action by providing suitable materials, locations (classrooms, labs, and lecture halls) and people who can teach their students (Liccardi et al., 2007). All activities can be 'face-to-face,' but many also are mediated by social networking technologies, including peer assessment, discussions, and collaborative work (Liccardi et al., 2007). Liccardi states that 30% of students use social networks to communicate with other students (trading posts on blogs, for instance) while more than 52% use online videos, podcasts, blogs, and wikis (group-authored

websites) during class time (Blankenship, 2011). Studies also show that social networking tools support educational activities by making interaction, collaboration, active participation, information and resource sharing, and critical thinking possible (Mazman & Usluel, 2010).

The main three top social networks in education are Twitter, Classroom 2.0, and Facebook (Kapuler, 2011). Students often use global social networks (i.e., Facebook, Twitter, YouTube, Classroom 2.0, etc.) for different purposes and around 60 % of these students say they use social networking tools to discuss classes, for learning outside school, and planning for college (Masic et al., 2012). Students also report that they are using chatting, text messaging, blogging, and online communities, such as Facebook and MySpace, for educational activities, including collaboration on school projects. Facebook, Twitter, and Youtube are the tools most used by the students because users, and especially students, interact and exchange knowledge in very easily accessible ways (Yuen & Yuen, 2008). The following subsections provide some details about the most popular social networking sites.

Presently, Facebook is used as a social network to keep in touch and keep up with other people. Initially, Facebook.com was used with ".edu" email addresses by university students. Carlson (2010) stated that in 2004, Mark Zuckerberg founded Facebook when he was a sophomore at Harvard University and a couple of years later Facebook was opened to the public. It has been used as a social network more than an education tool. Students use Facebook primarily for 'social searching.' That is, students use Facebook to learn more about a person they have met. It is also used for social and emotional support and as a resource to find information. Joinson (2008) has explained students send messages to friends and maintain social ties.

There are many ways to use Facebook in education. Online College.org (2011) has described Facebook can be used for collaborative learning, and has become a passion for students. In addition, students like to share, collaborate or work as a team. Futhermor e, Kessler (2010) has explained students can critique on each other's work and assignments with fairly easy access. Mashable Social Media (2010) has suggested

students can also ask their lecturer questions or chat and use Facebook as a message board for free.

The researchers found that students improve their vocabulary from the online comments and spell check. Such advantages of Facebook should be utilized by using the environment for writing and interactions, because students tend to show their interest as the writing environment is a space that students are deeply integrated in their day to day practices. Despite existing evidence of the potential of Facebook for enhancing writing skills, previous studies have not paid enough attention to the writing approaches that are available when the lecturer and students are given the space and time to improve writing. The results obtained from the studies mentioned above are far from satisfactory in understanding the use of Facebook for writing..

Also, Facebook is a marketplace for textbooks. It is a social network where books can be sold and bought. The next function of Facebook is the creating of groups. Online College.org (2009) has proposed using Facebook for academic purposes; these can be groups for an entire class or smaller study groups. There would be communication and sharing of information. The literature review of Facebook has shown there are many ways to use Facebook as a social network and for education in general. However, there is a gap for using Facebook in writing English as a foreign language and for medical students. Hence, this research is investigating ways to use Facebook in writing with economic students.

Three approaches to writing will be discussed in this section particularly process, product and genre approaches. The product approach focuses on grammatical features and appropriate sentences that fit in a pre-planned format. This helps students to realize that English essays are based on rhetorical patterns such as narration, description and persuasion. (Taha and Thang, 2014, Tan & Miller, 2007). Students' writing problems are neglected and they do not receive adequate guidance while producing a piece of writing. The product approach trains students to please the examiner and to achieve good results in the examination. Students are not trained to become good writers.

As a result, the purpose and process of writing are neglected in classroom teaching. In such a situation, accuracy is prioritized

over meaning making. Students fail to acquire essential writing skills related to jobs and academic papers. Process writing is an approach that focuses on the very process involved in producing a written product instead of the final product (Nunan, 1991).

The genre approach focuses on grammar, linguistic structures and social functions. According to Tribble (1996), the genre approach seems to share many similarities with product writing as it also emphasizes linguistic features and models that seem to guide the writers. However, one main thing that differentiates the product approach from the genre approach is that latter is produced according to the social context (Badger & White, 2000).

The literature review about grammar mistakes include may types of errors. Gary-Grant and Gingerich (2012), Orman and Purdue Online Writing Lab (n.d.) have presented misuse of relative pronouns – nominative and subjective pronouns. Also, there is misuse of vocabulary. For example, the misuse of 'affect' and 'effect'; 'bring' and 'take'; and 'lie' and 'lay'. Additional mistakes include misspelled words, misuse of nouns, pronouns, adjectives, adverbs and verb tenses, and misuse of infinitive/gerund, and misuse of articles (a, an, the). In addition, misuse of mechanics includes apostrophes, commas and periods (full stops), as well as capital letters. These errors have been focused on in the correction of the writing assignments.

The three approaches discussed above exhibit similarities and differences in instructional practices that they advocate. Evidently, there is no approach that is considered perfect to be implemented in the classroom. There is a need to integrate other tools to support the three writing approaches. The Facebook environment is a promising solution to a number of problems in writing. Utilizing of Facebook encourages the process writing approach. With utilizing of Facebook, students are able to go recursively through planning, drafting, revising, editing and publishing as they can access the Internet multiple times. Facebook permits learners to continue their learning activities outside the classroom. Additionally, the drafts are on the internet, therefore, there is no time limit to receive comments. The product approach can also be implemented since the lecturer can provide model essays, guidance and extra materials in the online writing environment. Criticism on

product and genre approaches can also be solved. The social interactions encourage students to share and exchange various ideas and opinions.

Action research focuses on the people involved in the research. It takes place in the classroom in a real-world situation with the aim to solve real problems. According to Ferrance (2000), action research is "learning by doing." The researcher or lecturer identifies a problem, does something to resolve it, measures how successful the efforts were, and tries again if unsatisfied. This is the essence of action research and this present research has taken place in the classroom to solve a problem.

METHOD

In the present research, there were three phases. Phase 1. Facebook users were asked to check another student's writing assignment. Phase 2. Students categorized the mistakes and made corrections. Phase 3. Six students were interviewed online to assess the effect of using Facebook in the teaching of writing.

The present research has been conducted with first semester English students in the Islamic education Faculty of Wiralodra University. The students' ages ranged from 19 to 20. There were a total number of 27 participants.

Course syllabus has stated the objectives of the Experiential English I course include the following: at the end of the course students should be able to communicate effectively in daily life using the four language skills (listening, speaking, reading and writing); and collect information from various kinds of sources and compare, analyze and synthesize the acquired information to broaden existing knowledge, and present important issues in oral and/or written form.

The classes run for three hours per week during the first semester of the academic year. There were two writing assignments. The participants posted their assignments on Facebook and received feedback from their peers and lecturer.

FINDING AND DISCUSSION

The coding of the grammar mistakes of this study was based on Gary-Grant and Gingerich (2012), Orman and Purdue Online Writing Lab (n.d.). The Cambridge Dictionaries Online, Dictionary.com, and the Dictionary and Thesaurus Merriam-Webster

Online (n.d.) were used to correct the misuse of vocabulary.

The Coding of Grammar Mistakes is as follows 1) misused vocabulary, 2) Misused tenses, 3) Misused singular/plural nouns, 4) Misused punctuations (commas and periods), 5) Misused pronouns, possessive pronouns, 6) Misused articles (determiners): a, an, the; 7) Misused prepositions; 8) Misused verbs; 9) Misused nouns/adjectives; 10) Misused capital letters; 11) Misused infinitive/gerund; 12) Misused superlatives; 13) Misspelled words

The participants coded the mistakes according to afore mentioned categories. The mistakes have been presented from the most common to the least common.

Misused vocabulary
Example 1:
(SW) Student's writing: Ipad may refract you
(C) Correction: Ipad may distract you.
Explanation: distract (v.)--to make someone stop giving their attention to something refract (v.)--when water or glass, etc. refracts light or sound, etc., it causes it to change direction or to separate when it travels through it

Example 2:
(SW): Another downside is that Ipad may lead you to the wrong way.
(C): Another downside is that Ipad may misdirect you.
Explanation: misdirect (v.)--to use something wrongly or for the wrong purpose. wrong way (adj.)--there is something wrong, incorrect, inaccurate.

Misused tenses
Example 3:
(SW): This talk show is usually focus on ...
(C): This talk show is usually focused on ...
Explanation: Use the simple past to express the idea that an action started and finished at a specific time in the past.

Misused singular/plural nouns
Example 4:
(SW): My king goes everywhere to help his inhabitant.
(C): My king goes everywhere to help his inhabitants.
Explanation: The plural form of inhabitants is needed because there is more than one inhabitant in Thailand.

Misused punctuations (commas and periods)
Example 5:
(SW): such as reviewing your lesson ,
(C): such as reviewing your lesson,
Explanation: The comma (,) is place at the end of the word, then a space is needed.

Example 6:
(SW): We cannot think of nothing but products from Apple .
(C): We cannot think of nothing but products from Apple.
Explanation: The period is placed at the end of the last word of the sentence, followed by two spaces.

Misused pronouns, possessive pronouns
Example 7:
(SW): My mother teaches me to do your best and not to ...
(C): My mother teaches me to do my best and not to ...
Explanation: Agreement in person. When writing in the "first person" (I), the possessive pronoun is "my."

Misused articles (determiners): a, an, the
Example 8:
(SW): So, Indonesia people have the better quality of life.
(C): So, Indonesia people have a better quality of life.
Explanation: Use a or an when talking about one thing in general, without saying which one.

Misused prepositions
Example 9:
(SW): Your close friend may get a scholarship to study in somewhere that is far from Indonesia.
(C): Your close friend may get a scholarship to study somewhere that is far from Indonesia.
Explanation: In general the preposition in is used to indicate inside the building, or for an enclosed space or area.

Misused verbs
Example 10:
(SW): Most of them have older ...
(C): Most of them are older ...
Explanation: The main verb "to have" is used to show possession of objects, characteristics, relationships or other qualities. The main verb "to be" is used to show the role or position that one has at work, family or other organization.

Misused nouns/adjectives
Example 11:
(SW): Multi Touch has high accurate.
(C): Multi Touch has high accuracy.

Explanation: Accurate is an adjective. Accuracy is an uncountable noun. A noun has to be used in this sentence.

Misused capital letters
Example 12:
  (SW): The work It's ...
  (C): it's
Explanation: Common nouns are not capitalized.

Misuse infinitive/gerund
Example 13:
  (SW): Ipad can distract you from what you should be do.
  (C): Ipad can distract you from what you should be doing. (object)
Explanation: A gerund is used because it is the object or complement of a sentence.

Misused superlatives
Example 14:
  (SW): Oprah Winfrey's talk show is the higher rated TV program in America.
  (C): Oprah Winfrey's talk show is the highest rated TV program in America.
Explanation: The superlative adjective is used when talking about three or more things. It expresses the extreme or highest degree of a quality.

Misspelled words
Example 15:
  (SW): now a days
  (C): nowadays
Explanation: Nowadays is one word

The most common mistakes are misused vocabulary, followed by misused tenses and misused singular and plural nouns. In addition, there were errors in punctuation of commas and periods as well as misused pronouns and possessive pronouns. There were also misused articles (determiners): a, an, and the. Then there were misused prepositions. In addition, there were misused verbs, nouns/adjectives, capital letters, infinitive / gerund. Lastly, there were misused superlatives and misspelled words. Phase III involved 6 participants' comments about this present research.

Student A has suggested that Facebook can focus on writing and speaking. Student A has stated: "Teaching English via Facebook should focus on speaking and writing because these parts require interaction between students and lecturers. Students can spend their time practicing English freely as they wish, and lecturers can evaluate or grade their work any time. I find this very convenient for both sides. Facebook offers rapid access to send and evaluate essays or speaking files and for the reading and listening part, lecturers can upload their materials on Facebook, but I prefer not to listen to lectures. I think that it will be more beneficial if there is plenty of self -homework for students. Just like TOEFL sample questions."

Student B has explained the use of Facebook would depend upon the equipment that is available. This student thinks that accessibility is not a major factor since textbooks can be used.

Student B's comment is as follows: "Well, I think that it depends on how well are the teaching tools developed on Facebook. Although teaching English on Facebook might potentially improve accessibility, it deteriorates the authenticity of textbooks. In short, there are advantages and disadvantages in using and not-using Facebook as an English teaching tool, and the question "which way is better?" Depends on the "quality of the tools on Facebook" not the Facebook itself. To illustrate, I won't waste my time reading or watching how to write a good essay via Facebook. I prefer to get one of the best "summary" on how to write a great essay within 1-2 papers and some examples to read; and here, Facebook can play roles in how I can send my essays to someone to grade, comment, and modify them."

Student C has explained the use of Facebook can be effective. This is because documents, announcements and additional material can be uploaded onto Facebook. Also, it is an effective way to contact students. Student C has commented: "I think using Facebook as a tool for teaching English and learning resource is efficacious. You can upload documents; make announcements and any other material as a supplement. Thus, you will potentially solve the problem that many students want you to bring more copies because they lost them or your copies are insufficient. Furthermore, it is a fast way to reach students. I definitely like your idea (using Facebook) since it's a practical and easy way."

Student D has commented that Facebook is ideal when interaction is required. However, it should be a closed group. Student D has pointed out: "Facebook is ideal for developing English skills that require interaction. However, as far as I'm

concerned, using formal language in Facebook still looks weird to me. Anyway, I guess its fine to stay formal but you might like to keep it private to your groups, your colleagues will think that you're nerdy otherwise."

Student E: "I like it. I think it is fun."

Student F: "It is useful. I can work at home."

The interviews indicated that the participants enjoyed it and found it to be useful. In addition, they can work from home. The equipment plays an important part in making it successful. One student thought that using Facebook would be appropriate with speaking and writing. In addition, Facebook is helpful because materials can be uploaded and shared. However, it ought to be used only by the participants in the class. It should not be opened to other classes or the public.

CONCLUSSION

First semester English students in the Islamic education Faculty of Wiralodra University were the participants in this present research. It was initially conducted because students' have an interest in using Facebook. When the researcher went into the class, one of the students in the classroom was using Facebook. She believed that she was the initiator of using Facebook in the class. The timing was perfect. It was a "blessing in disguise." This present research was conducted to investigate the effect of using Facebook to assist interaction between classmates and the lecturer in writing English. The participants read each other's writing assignments on Facebook.

The participants and lecturer categorized the mistakes and made the corrections. From the findings, it has been found that participants had the most problems with vocabulary. Next, the participants had problems with tenses. They used incorrect tenses and singular and plural forms of nouns. The participants' comments suggested using Facebook is fun. The assignments can be completed at home and assignments can be corrected during students' free time. They do not have to do it immediately. In addition, participants can communicate synchronously. Materials and documents can be uploaded and participants can work on it later or at home, such as writing or speaking assignments. Lastly, it is important that the hardware work appropriately. From the

students' evaluation, the use of Facebook is a fairly effective tool.

READING DEVELOPMENT ON EARLY CHILDHOOD

Maya Rahmaningtyas

Dewi Sri Kindergarten, Demak – Indonesia

E-mail: mayarahmaningtyas@gmail.com

ABSTRACT

Many countries make interesting programe to improve reading habit. By reading habit, they can be independent country. According to a new study conducted by central Connecticut state university in US, Indonesia is the second least literate nation in the world in a list of 61 measurable countries. Better than Bostwania, it is the lastest of measurable countries. It makes Indonesia disappointed, so Indonesia must make a new program or solution which it can be better to increase the rank. Reading habit will be useful to implemented since early childhood. Before entering Elementary school, children have to know how to read, write and account. If they can not do it, they can not enter 1st grade. In kindergarten, the children are playing while learning. It makes parents worried, so they ask someone or teacher to give the children private lesson. They force the children to understand well about sentence. The children can be bored, not interesting in reading, feel oppressed. So it makes them dislike to read a book and more interesting in games or gadgets. In literacy class, reading and writing experience can not be separated. Reading must be a part of daily life if we want to improve children ability and literacy. The parents and teachers have to make same perception in children's stimulation. The teachers make interesting and meaningful lessons which appropriate children reading development. The parents and family give example and support to the children how to like reading book. Their environment will be colouring their activities or habits so they can be a good reader.

Keywords: reading development, reading habit, early childhood.

In present, a program for developing literacy in children from birth to seven years. It based on the following rationale (IRA, 1985). Play is the most natural of childhood activities and one of the most frequently observed. Hughes offers three criteria that may help to define play such as; freedom of choice, personal enjoyment, focus is on the activity itself rather than its outcomes. These criteria are foundational to the play process and in connecting children's development with their learning (Hughes: 2003).

In contrast to findings described above, DeBaryshe (1995) did not find a significant relation between reading style and children's interest in reading. However, her study did not involve direct observation of affective quality nor direct assessment of children's interest but instead coded types of verbal comments/questions during reading and mothers' reports of the frequency with which their children asked to be read to or read by themselves. DeBaryshe had hypothesized that maternal beliefs about children's literacy development would predict socialization practices, which in turn would predict children's interest in reading. She used two separate samples of mother/preschool children dyads.

Both samples were predominantly African-American, one low income, the other mainly working class families. To assess maternal beliefs, mothers filled out questionnaires about their views on their role as their children's teachers of school-related skills, the importance of positive affect associated with reading, importance of the child's participation in the reading interaction and several other factors. Information about reading practices was based on tape recordings of a dyadic reading interaction. These recordings were coded for the types of conversation that occurred, including the nature of questions asked and the type of feedback given to the child.

Children's interest in reading was indexed by maternal ratings of their children's enjoyment of being read to, requests for others to read to them and frequency with which children read on their own. The pattern of results was fairly consistent across the two samples. Although maternal beliefs about literacy development predicted reading practices, reading practices did not predict children's interest in reading. However, maternal beliefs did predict children's interest in reading.

Morrow (1993) divides the early reading activities for children into three stages. The first stage is a child realizes meaningful words and close to the child's life. This stage is shown in a child's reading behavior when reading food labels favorite, read his name, read the signs on the road, and read some of the names of restaurants frequented by children.

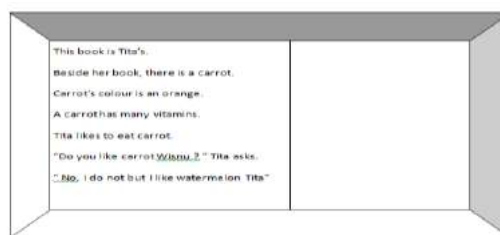
Figure 1. Children Sensory Manipulative Experiences

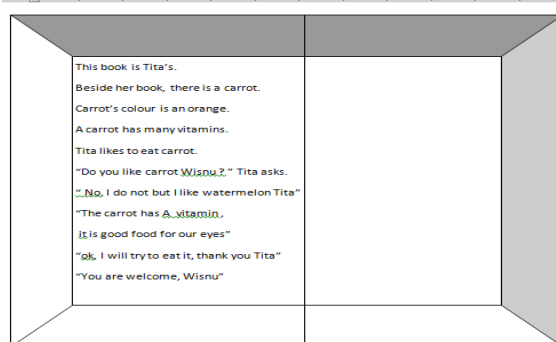
Teale (1981) relied on Vygotsky's (1962) theoretical framework when he identified children's initiation into book reading as a process in which they move from total reliance on the adult to independent reading as a result of modeling and interacting with the adult. Vygotsky had earlier described intellectual skills as growing out of social interaction, claiming strongly the social origins of cognition. From that perspective, the importance of read-aloud events is their social interactiveness,with the adult serving initially as mediator between text and child and providing the opportunity for both adult and child to make or take meaning from the text. The event gives die child both a model of adult reading and a support system during the child's transition to independent reading. During story reading, meaning is negotiated through the interaction of adult and child; it is constructed and reconstructed throughout the event (Piaget & Inhelder, 1969).

According to Solehuddin, dkk (2008) Children reading development in four ways: (1) Beginning reader, (2) Emergent reader (3) Early reader and (4) Fluent reader. Beginning reader is the children like to see someone who is reading something for them. They use pictures for reminding a story and show reading behaviour. Emergent reader is the children begin to suit writing and speaking. They are brave to read a simple word.

Picture 1. The book for emergent reader (source: private documents)

Early reader is the children can identification and understand the words in the sentence. They can adapt how to read the sentences.
Figure 2. The book for emergent/early reader. (source: private documents)

Fluent reader is the children can make connection what knowledges they have known and new knowledges. They are thinking about a writing message and their experiment to get an understand.


Picture 3. The book for early/fluent reader. (source: private documents)


Picture 4. The book for fluent reader. (source: private documents)

Both the frequency of reading aloud and the nature of the interaction that occurs during joint reading are important. Active discussion about story, particularly discussion that involves open-ended questioning and decontextualized talk is moststrongly associated with children's gains in vocabulary and literacy skill (Dickinson and Smith: 1992). Reading aloud may also have positive affective consequences by increasing children's interest in books, motivating them to engage in independent book-related play (Morrow, O'Connor, & Smith, 1990).

The present research explores the relation between characteristics of home-based dyadic book reading interactions and children's early literacy skills as well as their self-reported motivations for reading.We focus on the nature of utterances, the social/affective quality of the interaction, the age of the participants and the familiarity of the book

being read. Consistent with other researchers, we use the term early literacy skills to refer to those skills that are thought to be relevant for the acquisition of conventional reading skills (Snow et al., 1998).

At home, parents have a unique opportunity to introduce children to literature from an early age. These interactions help young children develop literacy skills that are invaluable for the future, as they provide a foundation for reading and writing.

"Read Aloud"—Kathy Egawa and Jennifer Katahira (2000) espouse the belief that "Reading Aloud is seen as the single most influential factor in young children's success in learning to read." They reiterate the ideals of Mem Fox, who calls for both parents and teachers to recognize the benefits of reading aloud on a daily basis. Choose a quality piece of literature and share it with young children, either in a lap reading setting (one on one), or in a small or large group setting.

Share a Variety of Books with Young Children - Some books quickly become favorites, and it is often important to read and re-read books, for children to feel comfortable with the plot and characters. Young children enjoy the predictability of some books, and this makes for a very successful reading session. Introduce the classics (nursery rhymes, fairy tales, etc…) or search for books with rhythm or rhyme that engages young children. As parents and teachers, we must not forget the need to introduce expository (informational) texts. Children benefit greatly from reading and interacting with books that challenge their understanding.

Talk About Books - Simply reading a fictional story book or informative text aloud does not develop an appreciation of the experience. Ask questions as the book is being read - "What do you see on the cover?" "What do you think the book might be about?" "Who is the author or the illustrator?" "Who are the characters?" "Where does the story take place?" Occasionally, you might consider stopping at a special place in the story to have young children predict what might happen next.

Provide Books in a Variety of Settings - Keep books in the car for entertainment. Prepare some favorite books on tape for young children to follow along with the story as you read; they can listen in the car, or using a 'walkman' they can listen anywhere! Buy books for the bathtub or to share by the pool or at the beach. Take a special book about zoo animals to read along at a trip to the zoo, or a book about food to the grocery store.

Bring Books to Life - Consider dressing up as a favorite character or making puppets of all the characters in a favorite story. This gives children the opportunity to "act out" favorite stories and to interact with the dialogue. Reading a story and retelling a story are two distinct skills, and young children are quite capable of retelling a favorite story if given the opportunity to think about the beginning, middle and end, and the main elements of the plot.

Showcase Letters and Words! - Emphasize to young children the fact that letters make up words and words make up sentences that create the stories they are reading. Take the time to point out other words that begin with the same letters as the letters in their name. Let young children tell you the sounds they hear as you read to them the many different words on the printed page. This "phonemic awareness" is the foundation for future success in reading.

Schickedanz (1999) lists several myths that surround literacy development. These are important to consider, as they help us recognize the fact that we have an important role in the child's language development.

Myth #1: Oral language must develop before written language can begin. Although oral language development is essential to good written language development, it is not a prerequisite in the way it was once believed. Oral and written language skills develop simultaneously, with supporting each other.

Myth #2: Children learn oral language naturally, but acquire literacy knowledge through direct instruction. We tend to overestimate the extent to which oral language learning simplyunfolds through maturation, regardless of the social circumstances, while we underestimate the extent to which written language learning can occur in day-today functional contexts, starting long before children receive formal instruction in the classroom.

Myth #3: Children must achieve a certain level of physical and mental readiness before written language learning can occur. Variations in rates of literacy development are due primarily to individual differences in children's learning rates, rather than to differences in children's early literacy experiences.

Children filled out survey forms concerning their after school activities on the previous day (Greaney,1980). Such surveys were completed once before the study began and again at its end. Items referring to voluntary reading were embedded within the lists of activities. The survey asked children to check all the things they did after school and before they ate their dinner, offering them the following choices: (a) played outside, (b) watched TV, (c) read or looked at a book, (d) read

or looked at a magazine, (e) played with toys or games, (f) did homework, (g) went to an after schoolactivity (sports, lessons), (h) went somewhere with a grown up,(i) listened to records or tapes, (j) did some arts and crafts. Children were asked to complete the same list indicating how they spent their time after dinner until they went to sleep. After checking off each list, they were asked to go back and circle the onething that they most liked to do. Children were asked to name favorite book titles, authors, and il-lustrators as indicators of their use of literature.

There are 20 students who joined this research, 8 girls and 12 boys. This research used action classroom, it was divided two cycles. The first cycle was on , the second cycle was on .
CONCLUSION

Teachers, parents and others have to make commitment to give children meaningful and enjoying activities. Teach them how to get enjoying experience in reading and confident. By seeing, touching, listening, they can explore sensory manipulative experiences. They have their own style of learning and appreciate their own reading development. Giving them rich

literacy experiences and make reading habit as enjoy as playing games or television.

MAPPING CAREER OPPORTUNITIES OF EDUCATORS

Milka

Christian University of Indonesia Toraja
Email: milkachery@yahoo.co.id

ABSTRACT

Mapping career opportunities educators. This study is aimed to describe the career opportunities of educators through training, promotion and transfer. This study used a qualitative approach with multiple case study design. This design is chosen because researcher want to map out and compare the educators'career opportunities on three High School, namely SMA Negeri 17 Makassar, SMA Islam Athirah Kajaolaliddo and SMA Negeri 1 Makassar. The research instrument is the researcher himself by taking a sample by purposive technique. The subjects were thirty informants. The data collection was done by using interviews, participative observation, and documentation. The data were analyzed constant comparatively with cross cases. The results showed that (1) the career opportunities of educators facilitated by the foundation to provide pre-service training and job training to increase knowledge and skills in teaching; (2) the career opportunities of educators through the promotion and advancement of structural positions implemented in the following aspects: (a) the procedure for promotion and advancement for educators comprise eight phases, (b) criteria for promotion and advancement of educators, among others, have passed pre-service training, linearity, and fulfill credit score and get A score in performance assessment, (c) promotion procedures of structural positions for educators consists of five phases, and (d) the criteria for promotion structurally divided into three main parts, namely the position of school principal , vice-principals, and ancillary tasks; (3) Educators are transferred either between regions and between the office no change financially and responsibility.

Keywords: mapping, career opportunities, educators

Educators (teachers), students, and curriculum are the three main components of education. Out of the three components, educators' factor is rated as the most important factors and strategic because it can influence the students' quality.

Daryanto and Tasrial (2015:74) states that the quality of education is determined by the quality of the teachers. The learning process is fun, exciting, and educate only be done by qualified educators. An indicator of the educator quality is able to maximize career in education.

But so far turned out to the career opportunity of educators have not met the appropriate portion. As perceived by educators in SMA Negeri 17 Makassar, SMA Islam Athirah Kajaolaliddo and SMA Negeri 1 Makassar.

Some of the career opportunities that can support educators profession are: (1) training, (2) promotion and advancement and structural (ancillary tasks), and (3) mutation. Those three part are the primary focus of this study.This study is necessary because if an educator career increases then of course the recognition on institution will also increase as evidenced by enhancement in wages or salary and reward highly influential on job satisfaction.

The tasks and responsibilities of the educators are required to be an agent of change. One way to meet these requirement, namely through training. As stated Filippo (1984:257) as follows.

> Though sometimes neglected in career workshops, the employee needs to know what types of jobs are now and will be available in the immediate future, as well as in the medium and long range. Information should be provided concerning actual duties of the jobs, as well as what is required in the way of training and development. Employees need to know how they become eligible for training, and the selection criteria for those who have completed training. And finally, it is important to know what job lead to other jobs.

In essence, the training can be divided into two, namely the pre-service training and in-service training. Pre-service training is a training that is given to civil servant and non-civil servant with the aim skillful to carry out tasks that will be entrusted to him. Pre-service training is a form of training that aims to improve the quality, expertness, abilities, and skills (Thoha, 2008:40).

The term promotion means increased. Flippo (1984) defines promotion as the transfer from a position to another position which has the status and responsibilities of higher and is usually accompanied by an increasing salary or wages. Furthermore

Sikula (1981) looked technically promotion, which is a transfer within the organization from one position to another involving the increase in wages and status.

Promotion is the reward to outstanding educators to greater responsibilities, such as promotion ofa higher position. Promotion in the form of promotion of civil servants is set on April 1 and October 1 of each year, unless otherwise for some types of promotions that may be specified. There was also a promotion to a structural position (Thoha, 2005: 33).

One of the function of development of educators is to increase efficiency and effectiveness in workplace through transfer. Dessler (2011: 15) mentions transference is a transfer from current job to another, usually without any changes of salary levels. Saydam (2005: 554) bisects the notion of transfer, namely: (a) activity relocate staff from one workplace to the new workplace, and (b) the activities relocate staff from one job to another in the same unit. The term mutation is defined relocate staff from one office to another office, whether the same level of pay or wages or lower than the original (Manullang and Manullang, 2011: 157). While Castallo (1992: 145) considers the term mutation consists of two meanings, namely: (1) changes in the level of "class", and (2) the movement of employees from one term in another area.

METHOD

This study used a qualitative approach with multiple case study design. The study design is chosen because researchers desire to compare and map out the career opportunities of educators on three High School, namely SMA Negeri 17 Makassar,SMA Islam Athirah Kajaolaliddo and SMA Negeri 1 Makassar. The research instrument is the researcher herself by taking a sample with purposive technique. The subjects were thirty informants consisting of excel educators, vice principal of curriculum affair, vice principal of human resources affair, vice principal of public relations (PR), vice principal of students affair, vice principal of facilities and infrastructure, counselors, school principals, head of human resources division, employee of the Education Department's office of Makassar, and supervisors. The data collection were done by using interviews, participative observation, and documentation. Furthermore, the data were analyzed by

constant comparative technique of cross-case through three strands, namely: data reduction, data presentation, and drawing conclusions.

FINDING AND DISCUSSION

Based on analysis of cross-case with constant comparative method findings related to the first focus can be presented. Aspects of pre-service training (pelatihan prajabatan) can be explained as follows. First, educators must attend pre-service training (preservice training) when it has passed the selection recruitment. Educators who pass the selection in government schools have status as the prospective civil servant, while educators who are received in private schools begins with the pre-contract status. Second, the material in pre-service training (preservice training) for educators in the School Self-contained Category is quite diverse, namely: the civil servants responsibility, the State Guidelines, Guidelines the Pancasila (P4), civil servants' discipline, civil administration, the KALLA's value and UMMI method based on Al- Quran.And third, the waiting period of the implementation of the existing pre-service training in a range of weekly and yearly.

Further the aspects of in-service training can be described as follows. First, a variety of in-service training is the realization of the program of the various elements are mutually continuous, they are; the school unit / high school, city deliberation subject teachers (MGMP), city education office(Dispend Kota), province education office (Dispend provinsi), Institutions Education Quality Assurance (LPMP), Ministry of Education and Culture (Kemendikbud), the Human Resources department, and other agencies. Second, the in-service training in the form of professional, technical, personal development, general, and specifically to increase knowledge and skills of educators. Third, shall be attended by educators with the recommendation of the school principal, the instruction of human resources division, as well as a request from the organizers of training.

There are four aspects related to the second focus, namely: (1) procedure of promotion and advancement, (2) criteria for promotion and advancement, (3) procedures structural promotion, and (4) the criteria for promotion structural position. The findings of the fourth aspect are described as follows.8

Aspects of the promotion and advancement for educators in School Self-contained Category (Sekolah Kategori Mandiri) consists of eight procedures. First, the leaders issued a submission letter on behalf of the names of the educator that it was time to propose a promotion. Educators at SMAN 17 and SMAN 1 Makassar formally not get a letter of delivery, but with its own consciousness can know the time of the nomination of promotion based on regulations (Permen PAN dan Birokrasi No. 16 tahun 1999). In contrast to high school educators in Islam Athirah who had obtained a formal submission letter of the head of the HR department of the names was time proposes a promotion. Second, the principal forward the submission letter to the teachers concerned to follow up. Third, educators responded by collecting archival Decree tasks and training certificates. Fourth, compile the List of Proposed Establishment of Credit (Dupak) either independently, employee assistance, or a more experienced colleague. Fifth, educators complete the file of proposing a promotion with a cover letter from the principal. At this stage it is at the core procedures for promotion and advancement acknowledged by the principal. Sixth, the proposing promotion file assessed by the assessment team credit score. For educators at SMAN 17 and SMAN 1 Makassar held at Makassar education office. While for educators at SMA Islam Athirah Kajaolaliddo is held by the internal management (director and head of the division). Seventh, the submission of names who passed to the authorities in order to be issued promotion Decree (SK). Eight, issued Decree (SK) Promotions for educators SMA 17 and SMA Negeri 1 Makassar Makassar by the local government (rank III / b - IV / a) and the central government (rank IV / b -iv / e). Published Decree (SK) for educators SMA Islam Athirah Kajaolaliddo by the director of the foundation.

Aspects of criteria for promotion and advancement of educators in the School Self-contained Category, include: (1) pass pre-service training. Differences in implementation of the Pre-service for educators of civil servant status with pre-contract lies in the diverse participants, content and duration of implementation. Pre-service training for employees is run for a month with a variety of materials provided to participants from various institutions. While pre-service training for pre-contract in Athirah foundation is run for a week with materials about the KALLA's values and UMMI methods based on Al-Quran (specifically for educators). (2) Linearity, means that educators have educational qualifications in accordance with the subjects taught in schools. Linearity educators in the School Self-contained Category (SKM) is also linked with the educational qualifications possessed, namely Minimum Bachelor (S1). (3) Particularly, or educators in SMAN 17 and SMAN 1 Makassar must meet credit numbers as stipulated in the Regulation of the Minister of Administrative Reform and Bureaucratic Reform (PERMEN PAN dan RB) No. 16 of 2009. (4) Educators at SMA Islam Athirah Kajaolaliddo should get an A in performance assessment. The performance assessment is made up of ten indicators, namely: knowledge / expertise, planning, creativity, communication, leadership, discipline, motivation worship, service orientation, encouragement of achievement, and work in teams.

Procedures aspects of the promotion of structural position can be explained as follows. First, the coordination between the leadership and the principals on behalf of the educators' candidates worthy of being promoted to certain positions. Leaders is meant is the head of the education office of Makassar for educators in SMA Negeri 17 Makassar and educators in SMA Negeri 1 Makassar. While the leadership the SMA Islam Athirah Kajaolaliddo is the head of the HR department. Second, the principal mapping the names of the candidates who are match the criteria. In this section mapping the names of candidates intended for educators who will be promoted to the position of prospective principals, vice principals, homeroom teacher, coordinator of subjects, laboratory head, and the head of the library. Third, for the present the leadership positions in the public schools mandatory through the process of bidding positions. Difference with the process for the educators at SMA Islam Athirah Kajaolaliddo, which should be based on the recommendation from the principal of SMA. The result of this recommendation is followed up by the HR department in promoting the educators for the position of school principal or vice-principal position. Fourth, some of the positions such as: homeroom teacher, subject coordinators, assistant vice principal, head of the laboratory, and the head of the library are appointed directly by the principal due to the

prerogative. Fifth, involve subordinates in the election of vice principal in particular in the public schools.

Overall the aspects of the criteria for promotion of structural position for educators in the School Self-contained Category consists of ten parts. But implicitly ten sections include criteria for promotion principals, vice principals and other ancillary tasks. First, to the position of principal at least had ever served as vice principal, has the ability to draw up strategic plan and has passed the selection test (psychological test and interview). Especially for candidates from public schools at least have the education or training as prospective principals. Second, for the post of vice-principal position at least had ever served homeroom, understand the task of vice-principal, disciplined, responsible, and carry out tasks as instructed. Third, for a position as a homeroom, coordinator of subjects, head of the laboratory, and the head of the library at least have a discipline, responsible, carry out duties as instructed, have a good work ethic, social skills, and able to work in teams.

Furthermore associated with the third focus it was found two aspects of the career opportunities of educators through transfer, namely: (a) the basic mutation, and (b) the impact of the mutation. Both aspects will be described as follows.

First, educators including principals were transferred to other schools based on individual requests and policy leaders. In general, educators in term civil servant (PNS) whose transfer on the basis of own requests has several reasons, among others: (a) feel comfort because in proximity with family, (b) be able to compete globally, (c) opportunities to teach in other schools because teaching staff vacancy on specific subjects, (d) be able to have more diverse activities (not monotonous). In contrast to the educators at SMA Islam Athirah Kajaolaliddo who cannot propose own transfer? Transfer for educators at that school entirely within the authority of the HR division.

While transfer of the principals in Negeri 17 SMA Makassar and SMA Negeri 1 Makassar based on officers' policy, namely the head of city education department Makassar and head division of HR. The school principal also frequently conduct transfer in his school. Every new school year transfer is carried out on homeroom and vice

principal by reasons of needs and based on performance.

Second, educators transfer affect inter alia: (a) transfer school principal is still influenced by practical politics so that they have to show loyalty if they desire to maintain its position. In contrast to transfer process of school principals at SMA Islam Athirah Kajaolaliddo is not influenced politically but entirely within the authority of the head of the HR department. However educators at that school at any time to be ready transferred to other units in various regions (Bone district, Bukit Baruga-Makassar, and Kajaolaliddo-Makassar). (b) For educators in SMAN 17 and SMAN 1 Makassar, transfer impact on the fulfillment on personal comfort because it is not separated by a distance so they can gather with family. (c) Opportunities for educators in the School Self-contained Category for developing potential, personal enrichment, and innovate.

People who are competent can be provided in two ways in the organization. First, organizations can select the best ones. Second, people who are in the company can be trained and developed to exert their full potential. Good training and development can be organized in two situations: (1) when work require individuals that have expertise knowledge, or attitudes that are different from the currently owned; and (2) when the progress in the organization requires individuals to have different or new skills, knowledge and attitudes. (Simamora, 2006: 276). Furthermore Simamora (2006: 277) argues that the purpose of training in essence can be grouped into five areas, namely: improve performance, update the expertise of employees in line with advances in technology, reducing the learning time for new employees to be competent in the job, to assist solve operational problems, prepare employees for promotion, to orientate the employees towards the organization, fulfill the personal growth needs.

For the promotion and advancement of civil servants has been stipulated in Government Regulation No. 3 of 1980 is as follows: (a) Regular promotion is a promotion given to the Civil Servant that meets the requirements prescribed without regard to the current position, (b) Promotion of choice is given to the Civil Servant who assumed office a certain structural or functional positions that have met the requirements specified, (c) a special

promotion given to civil servants who demonstrate exceptional performance to the good; new discoveries that benefit the state, and (d) the promotion of devotion is given to civil servants who have reached the retirement age and will end his tenure as civil servants with pension rights (Thoha, 2008: 34).

In general matters taken into consideration for placement in the positions is the assessment of the work performance, expertise, attention (interest), list of ranks, loyalty, experience, reliability, and potentially to be developed. (Thoha, 2008: 37).

There are three systems in employees transfer, namely merit system, seniority system, and the spoil system. First, merit system is based on the scientific, objective, and job performance. Merit system or the career system is a mutation that is good for several reasons, among others: (a) output and productivity will increase, (b) work spirit increase, (c) the amount of the mistake decreased, (d) attendance and discipline employees be better, and (e) the number of accidents will decrease. Second, the seniority system is a transfer that is tenure based and concerned with age, and work experience of the employees. Such mutation system is not objective because skill of the transferred people are not guaranteed be able to assume new post. Third, spoil system is based on familial transfer. Systems such mutation is not good because it is based on considerations like or dislike (Hasibuan, 2012: 103).

CONCLUSION

Based on the description in the results and discussion, it was concluded that (1) the career opportunities of educators is facilitated by the agency to provide pre-service training and in-service training to increase knowledge and teaching skill. (2) Educators career opportunities through promotion and structural positions outlined in the following aspects: (a) procedures for the promotion and advancement of educators includes eight stages. The difference of these stages lies in submitting; formal and non-formal as well as the authorities issued the decree of promotion, (b) criteria for promotion and advancement of educators, which have passed pre-service training, linearity, fulfil credit score and get an A in performance assessment, (c) promotion procedures of structural positions for educators consists of five stages, and (d) the criteria for promotion structurally divided into three main parts, namely for the position of principals, vice principals and other ancillary tasks. (3) Educators are transferred between regions and between the same office without change financially and responsibility.

PATTERN OF SCHOOL REFUSAL BEHAVIOR ON STUDENT; BACKGROUND, TRIGGERS, AND TREATMENT

Mochamad Nursalim; Nur Hidayah; Adi Atmoko; and Carolina L. Radjah
State University of Surabaya, Indonesia
e-mail: mochamadnursalim@unesa.ac.id

ABSTRACT

School refusal behavior refers to the avoidance of a child attending school and/or persistent difficulty staying in the classroom throughout the school day. Based on a review of the scientific literature, the purpose of this study are: first, examine the pattern of school refusal from the perspective of psychoanalytic theory; the theory of behavioral and cognitive theory. Recognizing the background, trigger school refusal and intervention strategies. This paper concludes that: first, the school refusal background in psychoanalytic is from separation anxiety and hallucinations, in the cases studied student are frightened to his teacher manifested as though seeing a ghost in classroom and out classrooms. In Cognitive view, the the background of the school refusal i.e.: affected by irrational beliefs of students to the school. In behavioristic theory argues that school refusal as a learned response to specific stimuli associated with the school environment. The triggering factors of the school refusal i.e.: a) the child has anxiety, such as (separation anxiety), b) the fear experienced by children related to academic activities, c) a parent is sick or conflict in the family, d) the intensity of stress while at school in caused because teachers or a friends at school. Interventions for reducing school refusal behavior can vary in strategies i.e.: cognitive restructuring, reframing, exposure (systematic desensitization, in vivo desensitization), differential reinforcement, modeling, and extinction.

Keywords: pattern of behavior, school refusal, triggers, interventions.

At present, the school has become an essential environment that cannot be separated from the child's life because most of the time children spent on activities at the that place. But there are some children who cannot enjoy school activities because of excessive fear feeling (Beidel & Turner 2005). This fear may be caused by less pleasant events associated with teachers, friends, lessons, or even a problem with the family, which makes the child feel uncomfortable to go to school. Unfortunately, not all children are able to express the problem to others and tend to hide his fear itself (Wenar & Kerig, 2005). It makes them do not get help to resolve his problem although on the other hand they are also difficult to find a way to overcome his fears. Quite often children end up refusing to go to school to avoid the things that he feared.

School refusal peaks at ages 5-6 and 14-15, however the mean age falls around 10. Overall, school refusal is equally distributed among gender, socioeconomic status (SES), and intelligence (Kearney & Albano 2000). There are, however, some demographic variables that are associated with specific subtypes of school refusal. For example, children with a low SES tend to be more anxious or fearful of social elements of school (teachers and peers), whereas those from higher SES's are more afraid of evaluative situations such as grades and exams. Further, school refusal with or resulting from separation anxiety seems to be comprised of more females, while school refusal associated with a specific phobia seems dominantly male (King, Ollendick, & Tonge 1995).

School refusal behavior is a psychosocial problem for students characterized by severe emotional distress and anxiety at the prospect of going to school, leading to difficulties in attending school and, in some cases, significant absences from school (Kahn, Nursten, & Carroll, 1981). In addition to severe emotional upset, researchers have differentiated school refusal from truancy in terms of two other features: children who exhibit school refusal behavior remain at home with their parents' knowledge, and they do not exhibit characteristics of conduct disorder (Elliot, 1999; Heyne, King, Tonge, & Cooper, 2001).

Kearney (2007) suggests, or whether school refusal behavior should be distinguished from truancy as a different type of school attendance problem, as Heyne and colleagues (2001) recommend. Although there is no definitive consensus, there seems to be general agreement among a number of scholars in this area that there are different types of "nonattenders" (Elliott, 1999; Heyne et al., 2001). Scholars have described school refusal behavior fairly consistently, with a few exceptions (e.g., Kearney, 2008), as a subtype of nonattender: students who have attendance difficulties resulting from emotional distress. Although there is a lack of consistency in the literature regarding the operationalization of school refusal, this review will adopt the definition of school refusal as school non-attendance associated with anxiety or distress.

The prevalence of school refusal is similar across socioeconomic groups and gender but is more common between the ages of 5 and 8 and 10 and 15, when children are either starting school or experiencing transitions between schools (Fremont, 2003; Heyne et al., 2001; Last & Strauss, 1990). Children who present with school refusal may meet criteria for multiple internalizing and externalizing behavior problems, including anxiety, depression, phobia, separation anxiety, aggression, temper trantrums, and non-compliance (Egger, Costello, & Angold, 2003; Heyne et al., 2001; Kearney, 2001).

School refusal is a complex problem that has been found to have multiple causes and be maintained by factors across the child's ecology (Thambirahah, Grandison, & De-Hayes, 2008). The onset of school refusal can occur gradually, either with no obvious etiology or as a result of a specific trigger. Stressors implicated in the onset of school refusal behavior include illness, problematic family dynamics, traumatic experiences, and school-related factors (Kearney & Bates, 2005). Individual factors associated with school refusal include personality characteristics, such as introversion, temperament, low self-confidence, and behavioral inhibition (Thambirajah et al., 2008). Family factors include increased rates of panic disorder and agoraphobia in parents of children with school refusal behavior, dysfunctional family interactions (e.g., overdependency, conflict, detachment, and isolation of family members), and poor communication (Bernstein & Borchardt, 1996; Martin, Cabrol, Bouvard, Lepine, & Mouren-Simeoni, 1999). Individual, family, and school context appear to be important to understanding the causes as well as the maintenance of school refusal behavior.

RESULTS AND DISCUSSION
Characteristics Of Students With School Refusal

Anxiety, depression, and physical complaints are frequently associated with school refusal. 1) Anxiety, Students with school refusal often exhibit separation, social/performance, or more generalized anxiety reactions as well as other anxiety disorders. Separation anxiety. Students with separation anxiety, which is most common in younger children, become preoccupied with thoughts of harm befalling a loved one and are overly dependent on parents and other caregivers. They may cry, kick, or run away to avoid coming to school. Many young children experience separation anxiety in preschool or when starting kindergarten. However, if the

behavior continues for weeks or even months, it is more serious and needs to be promptly addressed. 2) Social/performance anxiety. Students with social/performance anxiety worry about what others think, are concerned about how they will be judged, and fear humiliation. They may have intense anticipatory anxiety about giving speeches, taking tests, or participating in sports. 3) Generalized anxiety disorder. Students with generalized anxiety disorder (GAD) have excessive anxiety and worry about any number of situations and events. Their worry and anxiety is over and above

Etiology

The origin of school refusal shows heterogeneity similar to its behavioral presentation. Different factors that may influence the development of school refusal include a genetic predisposition, the home and family environment, the school environment and social pressures, as well as learning theories that emphasize the role of social reinforcement and modeling (King, Ollendick, & Tonge, 1995). It is possible that the four functions of school refusal may have distinct patterns of contributing factors, however this research is only in the early stages (Kearney, 2007).

A genetic predisposition is an inborn vulnerability that would place a child at higher risk for anxiety or emotional disturbances. Essentially, some expression of the genetic code makes these children more susceptible to developing school refusal behavior in response to anxiety or fear provoking situations. This may be seen more dominantly in the first three profiles; avoidance, escape and attention seeking (Kearney & Albano, 2000). Temperament is another genetic factor that has been implicated in school refusal. Emotional reactivity, activity level, mood and adaptability are components of temperament that can influence how we handle difficult situations. Finally, separation anxiety has been shown to have a weak genetic component (Doobay, 2005; Masi, Mucci, & Millepiedi, 2001). This means that if someone in the child's family has difficulties with anxiety, the child may be a greater risk to develop separation anxiety, and in turn more likely to refuse school.

School refusal an overview the perspective of "unconscious" Freud theory

Freud with his psychoanalysis has been the approach in the interpretation of behavior. Freud is a figure of the most widely discussed for the existence of the subconscious or the unconscious. According to Freud, the subconscious full deep thoughts and emotions and sometimes can express in various forms, one of which hallucinations. Freud said that although the subconscious is a part that missing from sight and its existence is often not realized, instead he is a deep conflict which will

affect the behavior of individuals (Freud in Sharon, 2005). Thus Freud's approach is one approach that gives contribution individuals psychic who are often difficult to be understood by naked eye.

On this basis, Freud's approach will be used to analyze one case of school refusal which is based on hallucinations, namely the students fear go to class and school that caused the students as if seeing a ghost. The approach will be one of the foundations in the reading and study of conversation between the counselor and counselee.

One of the concepts developed Freud is about the unconscious. According to Freud, the basic schematic of the individual soul is divided into three parts, namely conscious containing matters is based, natural pre-conscious that contain memory which can be recalled in conscious with little effort, and unconscious into place for the wishes, desires, thoughts, and emotions within the individual that cannot appear in consciousness, either caused of painful or desire. Freud strongly emphasizes the existence of the unconscious because although it is not realized, the unconscious is actually mostly affects individual behavior.

According to Freud, the unconscious material that contains something painful or desire through repression mechanism that is essentially a mechanism that closes minds, attitudes, and memories from conscious. However, as revealed by Freud, "everything that is repressed is unconscious; but we cannot assert that everything unconscious is repressed "(Freud, 1956) which means that it does not always matter which is in repressed the unconscious.

School Refusal Based on behavioral perspective,

Behavioristic theory argues that school refusal as a reaction to a specific stimulus learned related to the school environment. If the stimulus gets reinforcement associated with school refusal, then the behavior will be stronger / survive. According to Walker and Robert (1992: 168) school refusal is a form of behavior that can not adapt to the learning, which is a school refusal behavior maladaptiv with learning, is basically a behavior arising from the stimulus arising from the interaction of the mother and child. Kids who learn that school refusal stimulus acquired while he was at school was not fun when compared to the time he shared with his mother. This behavior is reinforced by reward or reinforcing factors (reinforcement) of mothers' behavior (parenting) is likely to increase if the child does

not go to school, and so on then the child develops a school refusal behavior.

At school refusal behavior, anxiety factor originated from low self-reliance among the interaction of parents and children who are too dependent on each other, so that when the parent and child interaction is experiencing a bottleneck, then it can cause anxiety in children in particular. When a child who always wants to be close to her mother can create a variety of reasons to stay at home, and the mother succumb to these reasons, the child will receive reinforcement that is a pleasure to stay at home. If the behavior occurs repeatedly, then the child will learn from the response that each time the child's mother will not go to school for various reasons, his mother would allow. In accordance with the behavioristic theory, in which the mother's behavior unconsciously occur as conditioning the child's behavior. The relationships formed between parents and children were also able to affect the incidence of school refusal behavior in children. One example of the relationship of children and parents are parenting, which can also lead to breaking down the school (school refusal) in children. Inadequate parenting as discipline is lacking, overinvolvement, or neglect of parents can raise or strengthen school refusal in children.

School Refusal Based on Cognitive perspective,

The etiology of school refusal behavior is complexly determined, However, temperament, family influences, and school experiences have allbeen indentified in the etiology of school refusal (King, at all, 1995). In additional stessful live events at home or school frequently occasion the onset of school attendance difficulties. Regardles of the initial cause of school refusal, the anxiety reduction assosiated with avoidance and/ or positive reinforcement recieved for staying at home become poweful motivating conditiaon for the child to continu to refuse togo to school.

The reciprocity beetwen these factors and the child's perception and cognitions must also be emphasized. Clinical evidence suggest that school-refusing children have low self efficacy and engange in anxiety-arousing thought in ambiguous or threatening situations. Parents may fail to work consistenly as ateam in helping their child and or lack the requisite child behavior management skills to ensure that the child return to school (King, at al., 1995).

Trigger of the school refusal

School refusal is often the result of separation anxiety, social anxiety, or performance anxiety (e.g., about speaking in front of others), or anxiety related to test-taking, athletic competition, or academic difficulties. Students may refuse to attend school to escape from a situation that causes

anxiety or to gain attention from a parent or other caregiver. Some students may feel that the school environment is cold and unwelcoming and a place where they experience failure. Consequently, they give up and just stop coming. Some students feel unsafe at school due to bullying or gang activity, and experience emotional difficulties associated with coming to school.

School refusal has been found to occur more often after vacations, weekends, or at the beginning and end of the school year. Events that prompt school refusal include the death of a loved one, a prolonged illness, moving or changing schools, entering kindergarten, and the transition from elementary to middle school. The problem is more severe in older children than younger children.

The cause of school refusal but in general Setzer & Salzhauer (2006) cites four reasons for avoiding school, namely: (1) to avoid the object or situation that is associated with the school that brings distress; (2) to avoid the situations that bring discomfort both in interactions with peers or in academic activities; (3) to seek attention from significant others outside out of the school; and (4) to look for pleasure outside school.

The home environment can be a cause of significant stress, and this stress can result in school refusal behavior. For example, moving to a new house or city may mean changing schools. This can be very difficult on children, especially if they did not want or expect to change. As a result, they may refuse to go to the new school as a way of fighting that change (King, Ollendick, & Tonge, 1995). Family stress can also play a role in school refusal. Illnesses, accidents, operations or deaths within the family can be a cause of acute school refusal, which may develop into chronic refusal if the child gains access to reinforcement from not attending school. Another consideration of the home environment is any marital conflict or parental psychopathology. These issues can lead to school refusal because they cause stress to the child, and also have an impact on parenting practices. Worse still, they can impact the effort and willingness of the parents to find solutions and resources for their child's school refusal. In these situations, it is important to find a therapist who understands how to work with the parents as well as the child (Kearney & Albano, 2000).

Although school factors are more straightforward, there is a substantial number of potential problems. Tests, homework, social pressures, bullying, and public speaking can all be sources of anxiety or fear leading to school

refusal. The problem lies in understanding which factor is responsible for the refusal behavior. Bullying, homework, and social pressures can be consistent or daily, whereas tests, presentations and public speaking are less frequent. This is when soliciting the teacher is most helpful, as they can provide a schedule of homework, tests, and presentations while also giving insight into the classroom dynamic. If there is an issue of bullying, there is a good chance the teacher knows about it, or can at least make an educated guess. Using information from both the child and the teacher should be a priority in determining the cause of school refusal (Kearney & Albano, 2000).

The Intervention

Learning theories can also be used to understand the initiation and maintenance of school refusal. Most of these theories focus on the role of reinforcement, however there is also a social learning theory that includes modeling and shaping of behavior (King, Ollendick, & Tonge, 1995). For example, mothers are often seen as a safe place during early childhood development.

Fear can be learned through direct conditioning, vicarious conditioning (modeling), or the transmission of fear messages (King, Ollendick, & Tonge, 1995). A fear of school and school related stimuli can be developed in a child by watching their older siblings or friends display a fear reaction (modeling), or simply by listening to their parents discuss a fearful element of school (transmission of fear messages). While it is possible to develop a strong fear simply by observations or based on accounts of others, it seems that direct conditioning is more likely to be involved in fear-based cases of school refusal (King, Ollendick, & Tonge, 1995). This type of learning includes the child experiencing the feared situation or stimuli his or herself. This experience can lead to the development of a specific phobia, which would propagate the avoidance of that stimulus. If the stimulus is within the school environment, school refusal behavior may follow.

Psychosocial interventions for youth who exhibit school refusal behavior generally fall into one of four categories: behavioral approaches, cognitive-behavioral therapy (CBT), family therapy, and non-behavioral, non-CBT individual therapy. All psychosocial interventions that aim to increase attendance and decrease anxiety in school-age youth who exhibit school refusal behavior will be eligible for inclusion in this review.

Psychosocial interventions for reducing school refusal behavior can vary in format, duration, setting, treatment components, and intervention targets. The formats can include individual, group, and/or family interventions. Duration can vary from brief interventions (6–8

weeks) to interventions that span across a school semester or school year. Interventions are most commonly delivered in a school or clinic setting. Treatment components can vary as well. Although most school refusal interventions involve CBT, they employ a number of different strategies that vary from program to program. School refusal interventions are generally either child or parent-focused. Master's or doctoral therapists generally deliver school refusal behavior interventions to children individually or in a group setting and to parents in the form of parental skills training.

Children and parents experience significant adverse consequences from school refusal. A child may miss an excessive number of days of school, leading to poor academic performance and disruptions in social and extracurricular activities (King & Bernstein, 2001). School refusal may also negatively affect family and peer relationships (Berg & Nursten, 1996). Long-term problems in social adjustment may also occur, including psychiatric disturbance (Heyne et al., 2001).

Behavioural interventions such as in vivo expo-sure and contingency management have been successfully used in the management of school refusal (Kennedy, 1965; Lazarus et al., 1965; Blagg and Yule, 1984). Reflecting a more contemporary clinical approach, Mansdorf and Lukens (1987) used cognitive-behavioural procedures in the treat-ment of two separation-anxious youngsters exhibiting school refusal. In addition to graduated school return and contingency management, subjective anxiety was successfully reduced through cognitive restructuring. More recently, we proposed a treat-ment model involving child therapy and parent/ teacher training (King et al., 1996). Child therapy entails the use of behavioural and cognitive pro-cedures directly with the youngster. This level of intervention aims to help the child cope with the stressors (e.g. separation from mother, peer bullying and teasing) associated with school return or regular school attendance. However, the involvement of parents and teachers is usually essential for

Functional Profile	Description	Associated Associated	Prescriptive Treatment
Avoidance	To avoid school-related objects or situations that cause general distress/ negative affectivity	Generalized anxiety disorder; specific phobia; panic disorder; emotional disturbance; depression; agoraphobia	Psychoeducation; exposure; systematic, desensitization; self, reinforcement
Escape	To escape aversive social and/or evaluative situations at school	Social phobia; depression; social issues or anxiety; shyness	Psychoeducation; role play; modeling; cognitive therapy; social skills groups
Attention	To receive attention from significant others outside of school	Separation anxiety disorder; oppositional defiant disorder; noncompliance	Parent training; contingency management; differential reinforcement
Rewards	To pursue tangible reinforcement outside of school	Oppositional defiant disorder; conduct disorder; substance abuse	Contingency contracting; response cost

Table 1: Functional profiles of school refusal. Adapted from "When Children Refuse School: A Cognitive-Behavioral Therapy Approach," by C.A. Kearney and A.M. Albano, 2000, p. 3-5

Since the development of the four functional profiles of school refusal, prescriptive treatment plans now exist and are receiving growing empirical support (King, Heyne, Tonge, Gullone, & Ollendick, 2001). Once a functional profile is found to be the primary contributor to the school refusal behavior, the prescriptive treatment plans offer a simplistic program for that functional profile (see table 1). These prescriptive treatments utilize evidence based cognitive and behavioral methods to alleviate the fear or anxiety associated with school, or they attempt to combat the positive reinforcement provided by either attention or tangible rewards. These treatments are designed to provide a heuristic approach, however every treatment program should be tailored to the individual child or family. This section will focus mainly on these treatments provided by Kearney and Albano (2000), followed by a short summary of other treatments which have been used historically.

Profile 1: Avoidance

Treatment for children who refuse school as a method of avoidance of school based stimuli should focus on changing that stimulus so that it no longer produces a feeling of dread, fear, or anxiety. Some elements of this treatment include building an anxiety/avoidance hierarchy of specific stimuli, teaching relaxation skills to help decrease somatic

arousal, and conducting systematic exposure to the desensitize the child to the stimulus.

Anxiety/avoidance hierarchy: An anxiety/avoidance hierarchy is a table that includes space for a situation or object and a place for the child to rate it both in terms of the amount of anxiety it produces and the degree to which they avoid it. To create an anxiety/avoidance hierarchy, the therapist should compile index cards with situations or objects that the child fears or avoids. Once presented to the child, the therapist can ask him or her to rank them in terms of how they feel about that situation or object. Some education may be necessary for the child to understand the anxiety or fear process, but it will have great benefit in both understanding what makes the child refuse school and how to direct treatment. When the child is ready to begin systematic exposure, the therapist can begin with the item that causes the least amount of anxiety and work his or her way up the hierarchy.

Relaxation Training: There are many different methods of relaxation training available. While many of these are well established techniques, a combination of progressive muscle relaxation and deep diaphragm breathing is preferred. Deep diaphragm breathing is achieved by inhaling through the nose and exhaling through the mouth. Progressive muscle relaxation is a technique in which a muscle group is isolated and contracted for five seconds, and then released. You can start with any muscle group, but the process should be linear (e.g. feet to head to hands, hands to head to feet).

Systematic desensitization: Systematic desensitization is the process of gradually introducing a feared stimulus in a small, stepwise fashion. A stimulus is presented to the child in imaginal form, often just the thought of the stimulus in the beginning stages. The child is instructed to raise his or her hand once the level of anxiety becomes excessive. As treatment continues, more realistic representations of the stimulus are introduced as the child learns to cope with them. Once the child is comfortable with any imaginal representation of the stimulus, it is possible to introduce *in vivo*, or real life desensitization, in which the child is placed in the context of that stimulus. Rather than listening to or viewing descriptions of the stimulus, the child and therapist role play the situation. The process continues in the same stepwise fashion, slowly increasing the realism of the stimulus until the child no longer experiences anxiety in the presence of that stimulus. Because this is such a delicate process, it is important to begin it only

after teaching relaxation and coping strategies, as well as reviewing the anxiety and avoidance hierarchy, beginning desensitization with the lowest stimuli.

Profile 2: Escape

Children who refuse school to escape situations in which they are being evaluated (e.g. oral reports, public speaking, taking a test) often feel extensive amounts of anxiety in these situations, so much that it makes them unbearable. Treatment for these children should identify any negative cognitions or thoughts they may have, teaching coping mechanisms to change those thoughts, and gradually exposing them to the anxiety producing situations.

Identifying negative thoughts: Depending on the age of the child, a STOP program can be useful in determining what negative thoughts occur and in what situations. STOP is a acronym with four components: S- am I feeling Scared?, T-what am I Thinking?, O- Other helpful thoughts, and P- Praise for using this model and Plan for next time. If a child is younger, simply imagining a stop sign can be helpful in decreasing anxiety. Once any negative thoughts are identified, they can be labeled and targeted.

Challenging and changing negative thoughts: Once the negative thoughts are identified, the therapist and child or adolescent must work together to change them. One commonly used strategy is to ask questions that can help refute negative and anxiety provoking thoughts. These questions can include challenging the likelihood of the feared situation, questioning if the person actually knows what others are thinking, or determining the most realistic consequence or outcome of a situation. It will be important to practice a variety of these types of questions, as they apply to different situations.

Behavioral exposure (role playing): Exposure is a process of imagining a stressful situation and acting it out with another person. For treatment of school refusal, the therapist and the child or adolescent will decide upon a situation that produces anxiety. It is best to start with mild situations and gradually progress into more feared situations. During these role plays, the therapist should help the child practice the STOP techniques to cope with any anxiety they may be feeling. By going through a variety of these anxiety producing situations, the therapist can help the child understand his or her own negative thoughts, and develop a way to cope with or challenge them. The overall goal of these sessions is that once confronted in the real world, the child will still possess the coping strategies and be better suited to handle the situation.

Profile 3: Attention

Children who refuse school for attention often exhibit noncompliance and disruptive behaviors, clinging, tantrums, refusing to move, and guilt inducing behavior. Treatment for these children differs from the previous two profiles in that it is focused on parent education and training, as opposed to child-focused strategies. Namely, prescriptive treatment for these individuals involves restructuring parent commands, establishing routines, and setting up punishments and rewards for school attendance.

Changing parent commands: In some cases of school refusal, the child who is seeking attention is extremely adept at negotiations, and is often able to change rules and guidelines set by parents. This treatment component focuses on eliminating these negotiations by providing parents with simple and specific commands. For most cases, a list is made of commands issued by the parents that are commonly refused by the child. This list is then expanded on to include when the command should be carried through, reducing the command to its simplistic form, and ensuring that nothing will interfere with that command. Parents are also trained to deliver the request in command form, as opposed to a question, and eliminate criticism and excessive speaking. This kind of training will establish the requests as commands that need to be followed, and not optional chores that can be negotiated. This component is combined with effective consequences and rewards described below.

Establishing routines: Having a routing makes a child's day more predictable, which can limit behavioral outbursts. In establishing routines, parents are asked to make a detailed schedule of the day (every 10 minutes) that they spend with their child. It is common that there is no regular schedule, and in this case a general outline can still be beneficial. From this, the parents and therapist work to create a basic routine for all activities. The morning routine is most relevant to going to school, and as such should be the primary focus, however it will be of benefit to have regular routines for all parts of the day to limit non-compliance. Having a more rigid schedule can promote a smooth transition to school. Once a routine is set and the child is used to it, consequences can be instated for deviation from the routine.

Setting up punishments and rewards: This treatment begins with the parents listing what disciplinary actions and rewards have been used in the past, and how successful they were. Then, with the help of the therapist, appropriate consequences and rewards are selected. After this, another list of negative and positive behaviors is made, and these behaviors are ranked in order of severity. Then the parents and therapist match punishments and rewards to the negative and positive behaviors, respectively. Because this child is assumedly refusing school for attention, it is helpful to include ignoring negative behavior and praising positive behavior as consequences. Attention should be paid to what consequences seem to work, but a special emphasis should be directed to the consistency with which the consequences are applied.

Profile 4: Rewards

Children and adolescents who refuse school to pursue tangible reinforcement outside of school are often secretive about their refusals, and may demonstrate behaviors such as aggression, running away, disruptive behavior, and substance use. Again, like the child refusing school for attention, treatment in this area is focused on immediate and relevant family members. The goal of this treatment is to improve problem solving within the family through contingency contracting.

Contingency contracting: The first step in contingency contracting is setting up a specific time and place to negotiate problems. This will help prevent arguments and disputes from erupting at undesirable times. Setting time aside also shows a commitment to problem solving and a desire to improve communication within the family. The next component involves clearly defining the problem behavior and related influences from both the parents and the child's perspective.

These perspectives will often be very different, and will require a compromise for everyone to agree on the behavior. After the target behavior has been clearly defined, a contract should be developed that is satisfactory to both parents and child. This contract will include rewards and punishments for how the child follows through with the behavior. Each contract should be considered final, but there can be a progression of contracts throughout therapy, each with more complex behaviors and consequences. It is generally best to start simple and small to ensure that every party is willing to participate in the treatment. Once the contract is designed, every member of the family should read and be familiar with it before they sign it. It is important that any disagreement regarding the contract be addressed prior to implementation. Once signed, each family member should be given a copy, and a master copy should be placed somewhere where the family can see it. As therapy progresses, new contracts will be continuously made, to the point that the child or adolescent is able to attend school with little encouragement and family members are able to communicate and problem-solve any issues that may arise.

CONCLUTION

First, the school refusal background in psychoanalytic is from separation anxiety and hallucinations, in the cases studied student are frightened to his teacher manifested as though seeing a ghost in classroom and out classrooms. In Cognitive view, the the background of the school refusal i.e.: affected by irrational beliefs of students to the school. In behavioristic theory argues that school refusal as a learned response to specific stimuli associated with the school environment. The triggering factors of the school refusal i.e.: a) the child has anxiety, such as (separation anxiety), b) the fear experienced by children related to academic activities, c) a parent is sick or conflict in the family, d) the intensity of stress while at school in caused because teachers or a friends at school. Interventions for reducing school refusal behavior can vary in strategies i.e.: cognitive restructuring, reframing, exposure (systematic desensitization, in vivo desensitization), differential reinforcement, modeling, and extinction.

ACTIVE LEARNING TO IMPROVE THE CREATIVE AND INNOVATIVE THINKING SKILLS

Mohammad Efendi

Special Education Department, Faculty of Education, University of Malang
email: efendi.plb@gmail.com

ABSTRACT

The results of the PISA test, students' achievement in mathematics in Indonesia for the last 3 years (2009 & 2012) for class IX / X SMP / SMA / SMK is no significant change. This indication appears from the analysis issued by the authorities turned out to be no Indonesian students who have a high order thinking skills (reaching level 4 s.d. 6). While the state of Singapore, Hongkong, China, Japan, Korea, who have put his position at level 6. The results are an indicator that Indonesian students have not coined higher level thinking skills to solve every problem. Indonesian students may only be able to explain verbally without any creativity to discover and explore through a variety of discovery and elaboration of the ability to think.

Keywords: thinking skills, active learning, effective learning.

The low skills of Indonesian students in such cases are not the fault of the students alone, but the effect of the teachers' learning activities in class. This condition indicates that the learning activities undertaken by teachers is not to trigger and stimulate students to improve their ability to be more creative and innovative in solving any problems encountered. The study results of the Department of Human Development, Community, and Culture, Bapenas, Republic of Indonesia (2016) concluded that "Increased academic qualification and certification of new teachers to improve the welfare of teachers have been not succeeded in improving the quality of learning" (Sardjoko, 2016). This means that the government's efforts to improve the quality of education at all levels through various programs in short term, medium term, long term for the last 10 years, since the regulatory of teacher and lecturer in 2005, has not real effect on improving the qualifications of teachers through teacher certification program. The study shows that the certification made by the government to date, the only positive influence on improving the welfare of teachers but it is not impact on improving the quality of teachers.

Take notice of the reviews on these research results we must feel sad, because the size of the budget allocation has been paid to improve the quality of education is not a significant impact. Whereas the main purpose of the certification is to improve the quality of teacher competence and the expected impact on improving the quality of education. Another benefit of the certification of teachers is for oversight and quality assurance of education personnel in order to develop competency,

career development of teachers with the best quality. Through the teacher certification programs can indirectly reduce of major issues facing formal education as follow: (1) the public opinion is that the national test scores as if describes the learning achievement as a whole, (2) the learning model that tends to separate the subject matter or between one competence with the competence, (3) the learning process is not centered on the learner, (4) the learning process has not been able to encourage the creativity of learners, (5) lack of resources to support learning provided, (6) many teachers have not been trained properly implement active learning, (7) the ability of the basic knowledge of students in basic education is still weak .

DISCUSSION
Active Learning Problems

The emergence of these problems, along with the low quality of student achievement produced by institutions of formal education especially in primary and secondary education level, considered as a result of an academic climate is not conducive. The implications of the decline in the quality of student achievement give impact on the readiness of the graduates at these levels for acting independently.

Initially, the root of the problem suspected causing decline in the quality of the student learning outcomes due to the lack of study time required to increase the absorption of students. On that basis, to spur the absorption of many schools ranging from elementary school to middle school to modify the learning hours, which adds to the learning hours between 8-15 hours per week. The result research on excellent primary schools implementing additional study hours about 10 hours / week, the result did not show significant

difference compared to student achievement before being given extra study hours (Padmanthara and Efendi, 1999). Even the latest issues (2016) related to the addition of hours of study in the school introduced a discourse of the full day school (FDS). Likewise, the arrangement of the curriculum that is constantly changing with the reasons for responding to the demands of society and the development of knowledge and technology. Whatever the efforts made, considering the results of these studies suggest that the improvement of limited quantity and partial only, without accompanied by improved quality in the other learning instruments, the outcome was still not in line with expectations.

The results of the mapping are successfully analyzed by Bappenas (2016) from studies of the performance of teachers linked to student learning outcomes, it turns out the learning paradigm used by teachers is more dominant Expository learning approach and not a discovery learning approach. but Expository learning approach is not able to cultivate the imagination, initiative, creative thinking and analytical skills of students in the classroom. "Teaching is not only about mastering the subject matters, but It is also about how to deliver the subject matters".

Active learning since some time ago continue to be expressed, in fact, it still be the right instrument to raise the quality of student learning outcomes, with a record articulated in practice truly meet the rules right. Rakajoni quoting McKeachie (1983), suggests there are seven dimensions that characterize teachers implement instructional grading how the active learning: (1) the participation of student in setting learning objectives, (2) the pressure on the affective aspects of teaching, (3) the students' participation in the implementation of learning, especially the form of interaction between students, (4) reception teacher to deeds and contributions of students who are less relevant even totally wrong, (5) cohesive class as a group, (6) the freedom of the opportunity given to students to take important decisions in the life of the school, (7) the amount of time that is used to help students, whether related to the lesson or not (Efendi ed., 2009).

It's no secret, if we are sharing a checklist to be filled in order to obtain a description about instructional strategy of teachers do, then the answer they will declare that they have carried out active learning, although in practice it is often never appear. Because teachers are more pleased with the pattern itself. They are generally still struggling with ways of conventional system, and tend to turn off the creative potential of students. This problem has been rooted in the nature of our schools and have formed attitudes of teachers to be very conservative, as a result of teacher beliefs seem difficult to be changed, if we will change, it takes a long time (Tangyong, 1989). In addition, the Master is still difficult to move and act seriously in preparing lessons based on the premise of good learning (Drost, 1998).

Departing from these problems, Susilo Bambang Yudhoyono when he was serving as president of the Republic of Indonesia has requested the Minister of National Education to transform teaching and learning methodology applied by teacher. Because the pattern of students' applied learning teacher at the time considered not encourage creative and innovative make difficult bring creativity and spirit of independence of students. According to the President, the methods of teaching and learning of the students performed since kindergarten, elementary school, high school rated shows that the teachers are active, while the students are no active. The learning process are judged to be able to develop innovation and creativity and independence (Kompas, October 30, 2009). From this next effect makes students less creative and innovative..

To overcome these problems, one of which is necessary to apply active learning approach. Through these efforts, we are trying to create a new image of the educational unit performing as a school that is able to make the learners are creative and innovative, and able to grow and develop spirit of self independence as the desired character of the nation together.

The application of active learning approach supporting the implementation of school-based management, have a legal basis which is derived from Act No. 20 of 2003 on National Education System. Legislation is further elaborated in Government Regulation No. 19/2005 on National Education Standards. The application of active learning, mean teachers students construct knowledge by way of formulating ideas or ideas into phrases and ideas developed through the reactions and responses of others (Bouton & Garth, 1983; Alavi, 1994). In other words, learning is not only active but also interactive. Learning processes that enable are more oriented towards the students (learner-centered orientation). Reciprocal interactions not only occur between students and teachers, but also occurs among students (transactional). The pattern of this interaction will further develop the social processes is higher, so it will be increasingly nurture the soul courage to express opinions, views, thoughts, feelings and in turn will foster cooperation or collaboration (Belen, 2008)

The teacher-student's interaction in active learning inspires education experts and learning to deliver a wide range of modeling work in innovative learning. Judging from the forms, a lot of learning models are commonly used as a strategy in education and training. In essence, the entire model presented as an active learning is the learning activities building an interactive, inspiring, fun, challenging, motivating students to actively participate and provide sufficient space growth initiative, creativity, and independence in accordance with interests, talents, and physical development and psychological of student.

So, ideally, learning patterns that must be built by the teacher should be oriented to active learning. The assumption, through an active learning approach will occur the transfer pattern centered learning teacher (teacher-centered approach) to the pattern of student-centered learning (student-centered approach) (Setyasari, 2009). Skill of Thinking in this context will be increased to the level of complex thinking skills. Complex level thinking skills is the kind of thinking requires understanding the fundamental (basic thinking) and has characteristics: demanding a variety of possible answers, assessment of people participating, and the placement of the meaning of a situation. Type of complex thinking includes critical thinking, creative thinking, and problem solving. Therefore, passive learning will not be able to encourage learners to achieve complex thinking skills.

Here are some examples of patterns of learning that can improve the skills of students to think creatively and innovatively.

Developing the ability to think creatively and innovatively in solving problems: make a list of attributes of the object / situation, generate ideas that vary (smoothness), produces different ideas (versatility), generating unique ideas (original), generate detailed ideas, synthesize reports.

The development of creative and innovative thinking abilities through evaluative learning skills can be done through: identifying common problems, clarifying problems, formulating the right questions, formulate alternative solutions, choosing the best solution, implementing the solution, the solution monitors the receipt, draw conclusions.

Developing the ability of creative and innovative thinking through learning skills deductive can be done through: distinguish between facts and opinions, assess the credibility of the source, observe and assess reports of observation, identifying issues and major problems, understand the assumptions underlying, detect bias-stereotyped and clichéd, familiar language too much, judging hypotheses, to classify the data, predict the consequences, to demonstrate the synthesis sequence information, plan alternative strategies, identify unconsistent information, identify the uttered reasons and which are not, to compare the similarities and differences, assess arguments.

Developing the ability of creative and innovative thinking through learning skills inductive can be done through: using logic, finding contradictory statements, analyze the syllogism, solve the problem of spatial (space), determine cause and effect, to analyze open problems, using reason by analogy, making tentative conclusions (inference), determining the relevant information, to understand the relationships of information, problem solving lived ("insight").

Consider that every student has the talent, intelligence and interests, as well as learning difficulties are different, and then. The teacher in the learning process should also pay attention and provide appropriate intervention to different individual characteristics.

The Professional Teachers

In relation to the development of students' abilities, implicitly Law 20 of 2003 has provided an opportunity for teachers to create conditions that enable so that students can learn and do in the context of cognitive learning and emphasizes the everyday environment (social context). This means that the creativity of teachers to develop themes relevant learning local conditions and situations becomes a very important part. Learning in schools progressively inspired by Piaget, embracing a curriculum and methodology that orientation in children, as well as individual learning where children can work in accordance with the level of ability and speed respectively.

In this way, the child is expected to be able to develop independence (autonomy), self-discipline in planning the learning agenda, and can determine their own selection of the many options available. Child-centered learning is ultimately also spawned a topic or theme-based learning, which emphasizes the integration of aspects of different curriculum.

Along with this, the implementation of innovative active learning and self-development as a base figure of students requires professional teachers who are able to do something with the high expertise or skills. Today, professionalism in carrying out the work has become public demands. Because people want to get the service of increasing quality for better results. To the end, every profession should be able to adjust to the demands of society in order not abandoned.

The professionalism of teachers is characterized by the mastery of competencies as

defined in Regulation No. 19/2005 on National Education Standards and Regulation No. 14/2005 on Teachers and Lecturers. There are at least four components of the competence that must be possessed by the teacher in performing his professional duties, among others: pedagogical competence, professional competence, social competence and personal competence (Kamdi & Suparno, 2009). The qualified teachers are able to innovate learning, ranging from designing, implementing, and evaluating learning to accurately match the needs of learners (Burden & Byrd, 1999).

A number of studies provide evidence that teachers' qualification and certification aimed at creating teacher learner with the spirit Pancasila, has a global prowess and futuristic, can follow and develop science and technology, which is based on cultural values and nationalism, as well as provide benefits to mankind. Therefore, teacher education revolution should begin with the development and implementation of a comprehensive system of teacher education from begin recruitment, education process and continuous coaching post of teacher education; as a form of recognition of the competence of teachers to impact student learning acceleration. Teacher certification as an effort to improve the quality of education in Inonesia, the results of the study Bappenas (2016) showed that the certification has been only a positive effect on improving the welfare of teachers, but It have not an impact on improving the quality of teachers. Even in the record Bapenas (2016) the issue of conditions of teachers still leaves problems, the number recorded in the records of government data 24.3% of them do not meet the academic qualifications, and 47.4% are not yet have a teaching certificate (Sardjoko, 2016). ✍

EVALUATION OF EDUCATION MANAGEMENT OF MA AZ-ZAHRI TLANAKAN PAMEKASAN

Muhammad Darrin Zuhri

Universitas Madura

Email: darentzuhri@gmail.com

ABSTRACT

The basic concept of Education Management is the occurrence of an activity or series in the form of business process management cooperation group of people who are members of educational organizations, to achieve the education that has been set in advance, to be effective and efficient. In addition, the important elements cover aspects Evaluation of Student Management, Infrastructure, and Management Promotion and relations with the Community School. This study aims to evaluate the three managements of education in MA Az-Zahri Tlanakan Pamekasan. This research is a descriptive study that aims to describe the phenomenon and evaluation of educational management. The approach used is a case study. This research is a case study because the focus of this study is to answer the question "Evaluation of the implementation of Student Management, Infrastructure, and Management of School Promotion with the society in MA Az-Zahri". This research was conducted in MA Az-Zahri, which is addressed at Teja street, Tlanakan Pamekasan. The results of this study indicates that MA Az-Zahri is one of the largest Private High School which has many students in pamekasan area. Nevertheless in the administration of education management is still far from perfection. Therefore, it needs the arrangement of Education Management which has an Effective and efficient. Based on these results, suggestions are submitted to the Student Program, Infrastructure program and Public Relations program in order to understand and execute the powers and responsibilities in accordance with its role to improve the quality of Education Management of MA Az-Zahri. These findings may be a reference in increasing of school education management, which has an effective and efficient.

Keywords: evaluation of education management, effective and efficient

MA private school is like as an institution or organization. As an institution or organization, schools carry out a particular mission and vision is to do the process of education, socialization process, and the transformation process of the students, in order to deliver the students is ready for their education at the next level, Senior High School. Because of this mission, then schools can be categorized as an agency or educational institution. As an institution or an educational institution, the high school organizes various educational activities for students and involves many components, so that the activity or component in elementary school requires good management in order to achieve institutional objectives upper secondary school.

Throughout the development of the education management theory, there are two theoretical models as a very useful approach in setting a good school, as proposed by Hoy and Ferguson (1985), the goal model and system model. The first is the model of interest, also called approach-goal attainment. The model was based on the traditional view of an organization's effectiveness. In the traditional view of the organization said to be effective when it reaches its intended purpose (Sergiovanni, 1987), so that the measurement through how to see operational objectives have been achieved from the organization (Daft & Steers, 1986).

The success of an institution to run the programs that have been planned or organized needs to be supported by an effective leader. remember that leadership is the driving force for the resources owned by the institution. Therefore, the leadership is referred to as an organic function in the management process. Related to the leadership of the following was stated: (1) the definition of leadership; (2) the type of leadership; and (3) the requirements to be an effective leader.

leadership can be defined as the whole process is to influence, encourage, persuade, move, and guide others in the work process in order to think, act, and act in accordance with the applicable rules in order to achieve the goals set. The essence of leadership is that person's activities to mobilize others, so others were pleased to carry out his duties.

In order to obtain a simple overview of the leadership, you need to distribute these with practical experience, ever felt in the life of the group. A person's leadership process

may appear as an attempt to influence others to act in accordance with what he wanted. Let's look at the environment of MA Az-Zahri Tlanakan Pamekasan, the principal tried to affect the entire board of teachers, homeroom, students program, publicist program, curriculum program and the school janitor. So that they would perform their duties in order to achieve the goals set. In addition Oversight is one thing that is important from a management function. The function absolutely must be done in any organization or institution. Incompetence or negligence perform these functions greatly influence the achievement of the goals of the institution.

The greater of MA Az-Zahri, the more people involved components or facilities used. In order to achieve the goals effectively and efficiently, of course, all those who were involved and the facilities need to be utilized in such a way for the success of education at the school. Utilization process all components of the school, it is called with the school management activities.

Successful management of education through the learning process is influenced by many factors, one of which is the availability of educational facilities were adequate with optimal utilization and management. Educational facilities is one of the important resources and foremost in supporting teaching and learning in schools, for it is necessary to improve the utilization and management, so that the desired objectives can be achieved.

Why study was conducted using the development of management education in MA Az-Zahri Tlanakan Pamekasan as its object? Observation and experience in the field from year to year shows that today there are still many schools that do not apply in high school education management professionally.

Based on the above, the evaluation of educational management in MA Az-Zahri Tlanakan Pamekasan consisting of: student management, infrastructure management, and relationship management with public schools that we think are very important to investigate. because the process of education management in MA Az-Zahri Tlanakan Pamekasan has not run in accordance with the program outlined. Among them in implementing effective education management and efficient.

METHOD

The approach in this study is a qualitative research. In this study the issues raised are activities related to the management of education in MA Az Zahri consisting of: student management, infrastructure management, financial management, and relationship management with public schools conducted by the school district MA Az-Zahri Tlanakan Pamekasan.

Focus to be studied is related to (1) Management of the student; (2) Management of school infrastructure; (3) Management of School promotion to society. For that approach is deemed suitable for use in this study is a qualitative approach.

The approach used to remember some things that characterize qualitative research. Feature is meant as disclosed Moleong (1994), that the distinguishing features with other types of research are: (1) rooted in the natural background or context as a whole; (2) human as a research tool; (3) using qualitative methods; (4) using inductive data analysis; (5) require more guidance towards the preparation of substantive theory derived from the data; (6) are more descriptive; (7) is more concerned with process than results; (8) limiting the study to a focus; (9) the specific criteria for the validity of the data; (10) design is temporary, and (11) the results of research agreements between researchers and informants.

The data collection was conducted by research observation, interview and documentation techniques. First, In observation, the researchers conducted observations with models of active participation observation. Namely researchers directly involved in school activities in the sense sit at a table together with teachers and involve themselves in any of their activities. Researchers are sometimes also help teachers and school in solving their problems while continuously observing the behavior of teachers during activities relating to management education. second is interview, interview is a conversation with a specific purpose which is carried by the two parties, namely the interview give interviewees questions and providing answers to the questions. Interviews conducted to obtain data and information relating to the knowledge, experience, opinions, feelings, background. In-depth interviews to key informants in this case the teacher is active in management education is the principal of MA Az-Zahri Tlanakan Pamekasan. Third is documentation, To

complement the data obtained through observation and interviews the researchers used the documentation. Documents can support the activities undertaken and related observations With the problems examined.

FINDING AND DISCUSSION
Students management

In interviews with the vice principal of student program (MA Az Zahri), in planning learners at the school conducted a number of considerations in the selection of these activities. First, with regard to the activities of the selected student. Second, the possibility of the activities carried out in terms of effort, cost and infrastructure are owned by the school. Third, with regard to the time available. Fourth, regarding the inhibiting factors to achieve it.

According to the student program, those considerations need to be done, so that what is planned is actually achieved and achieved their target. Thus, the activities programmed absolutely realistic and it may take place.

Based on studies in the high school student documents Az-zahri In interviews with the vice principal of student program (MA Az-Zahri), and the observations of researchers at the location, the school in planning the budget, equalization aspect is also highly considered. According to the statement Arifin lest, there are activities that did not get the budget, while the other puts on a budget. Except if the activity does not need a budget. Arifin said Inequality in formulating the budget can be justified, as long as remain stationed in the corridor or on the scale of priorities and activities deliberately seeded by the school, and have obtained the agreement of the component, the school committee and other stake holders. In interviews with the vice principal of student (MA Az-Zahri), After the budget allocated budgetary resources also need to be established. Budgetary resources, to schools MA have been clear, is derived from the regular budget, the development budget, Education Support Fund (DPP) School Operational Assistance (BOS), school / school boards / assemblies Madrasah and other donations.

The operational policies of admission of new students, contains rules regarding the number of students who can be accepted in a school. Determination of the number of students, would also be based on the realities that exist in the schools (school conditional factor). The conditional factors include: the capacity of the new class, criteria for students who can be accepted, the available budget, the existing infrastructure and facilities, available staff, the number of students who studied in the first grade, and so on

The operational policies of admission of students, also includes the registration system and the selection or screening that will be applied to learners. Additionally, admissions policies learners, also contains the time of registration, when they begin and end. Furthermore, the policy of admission of learners should also include on-personnels who will be involved in the registration, selection and admission of students.

The Management of School Facilities and Infrastructure

Based on observations of researchers, at this school there are several alternative ways of procurement of school facilities and infrastructure. Some alternative ways of procurement for the following ways: purchase, manufacture their own, receiving grants or assistance, lease, exchange and repair.

Based on the statement of Mr. M.Masruhin as a vice principal of infrastructure: The purchases are a way of fulfilling the needs of facilities and infrastructure that we did. Purchases made if the budget is available, such as the purchase of tables, chairs, benches, cabinets, chalkboards, wirelles, and so forth. Procurement of facilities and infrastructure by way of this purchase is one of the dominant way to do this adult school.

According to Mr. Masruhin, in addition to purchasing also be making its own: "Creation itself is a way of fulfilling the needs of facilities and infrastructure in our schools by making its own that are usually performed by teachers, students, or employees. Elections in this way should consider the level of effectiveness and its efficiency when compared to the way the procurement for the purchase. Making itself is usually done on the educational facilities that are simple and inexpensive, for example props made by a teacher or pupil. Most of the teachers here have made their own props for learning ".

The maintenance of School Infrastructure and facilities

Based on information from Mr. Hanafi is the head of MA Az-Zahri, the purpose of

Interest maintenance of infrastructure are: a) to optimize the life of the equipment; b) ensures the operational readiness of equipment to support the smooth running of the work in order to obtain optimal results; c) ensure the availability of the necessary equipment through checks routinely and regularly; d) ensure the safety of those who use these tools.

While the benefits of maintenance of facilities in our school are a) the time of facilities will be durable which means no need to hold a replacement in a short time; b) repair costs can be reduced to a minimum; c) will be controlled so as to avoid losing; d) more unsightly and seen, Gives a good job and more leverage.

Based on the observations of researchers, continuous care (regular, routine) is done at this school are a) cleaning of drainage channels of debris and dirt; b) cleaning of the rooms and the yard of debris and dirt; c) cleaning the glass, windows, chairs, tables, cabinets, etc; d) the clearing of grass and shrubs irregularly; e) cleaning and watering bathroom / wc to maintain health.

While regular treatment always done include a) repair or painting walls and other building components that already looks dull; b) repairing furniture (wardrobes, chairs, tables, etc.); c) tile repair damaged / broken which caused leaks; d) plaster coating on the walls were cracked or chipped; e) cleaning and drying the floor, the lobby page or exposed to rain / water stagnant.

School Promotion Management to the Society

Based on data from interviews with principals of MA Az-Zahri, the Board of teachers and look directly at the field school activities Things to look for people that are willing to rally support and contribute to the schools is an issue that will be used. Therefore, the selection of the right issue will affect their attention and support to the school. Schools need to have a keen sensitivity in capturing the issues that exist in the community to be appointed as the issue of education in order to raise public support for education in schools.

As what has been said by Ahmad Farchan To further ensure the effectiveness of promotional activities of the school, it is done by a particular team that is responsible for the implementation of promotional activities of the school. Therefore, in the school of MA Az-Zahri in the organizational structure of the school is no vice-principal /

department / unit that manages the school with public relations activities. This promotion should be carried out continuously by using a variety of media that exist among the people and the community concern

Based on data from interviews and direct view activity on school grounds, In order to enable parents, community leaders, school committees and stakeholders, one of the strategies that can be taken outside agencies such formal school committee is attracting the attention of the public through education quality produced by the teaching staff. That is an intimate relationship with the community begins to promote and demonstrate the quality of education that assures them, this can be addressed through product quality graduates. For it is said by Mr. Ahmad Faisol, S.Pd vice principal public relations, to do the following steps:

"Work culture should be initiated by the leadership to further develop a working environment (working environment) that is conducive to giving birth willingness to behave and act professionally by all citizens of the school. Discipline. All citizens of school discipline is one reflection / indicators of work culture in the school. Discipline will not be created automatically, but is formed through a process. In addition to note what and how the monitoring process is done and who is given the responsibility for monitoring the progress. What is certain monitoring student progress must be made and communicated to external customers and internal school ".

The role of the head of school to get support from the public

Based on direct observation of researchers, and on the terms of the statement of Suwarto as a foundation supervisor that many efforts have been taken by the head of MA Az-Zahri, namely: (1) to know yourself Strength, Weaknesess, Opportunities, Threats (SWOT), (2) trying to have credibility, Acceptability, Morality, and Integrity, (3) study the principles of leadership, (4) applies the principles of leadership, and (5) learning from feedback.

Based on observations of the researcher, the head of MA Az Zahri has characteristics of leadership as follows a) has a strong vision of the future of his school, and he encouraged all staff to realize the vision; b) has high expectations on student achievement and staff performance; c) diligently observe teachers in the classroom

and to provide feedback in order to solve problems and improve learning; d) encourage the use time efficiently; e) monitor student performance individually and collectively.

According to the results of interviews with the headmaster (Mr. Hanafi) Working in teams, including cooperation with the community to provide benefits, such as a) the job becomes lighter because it is done together; b) can lead to motivation of togetherness; c) more effective and efficient than done individually.

Based on the observations of researchers, in order to improve teamwork, the headmaster of MA Az-Zahri often hold group supervision. Mechanical supervision of groups is one way to implement supervision programs aimed at two or more people. Teachers are expected, according to the analysis of the needs, problems or needs or weaknesses that are grouped or pooled into one / together. Then they are given supervision services in accordance with the problems or needs that they face.

FINDING AND DISCUSSION

Based on the findings in the previous chapter, we will do a discussion of each of the following findings:

Student Management at the high school of MA Az Zahri does some considerations in the selection of these activities. First, with regard to the activities of the selected student, second, the possibility of the activities carried out in terms of effort, cost and infrastructure are owned by the school. Third, with regard to the time available. Fourth, regarding the inhibiting factors to achieve it.

There are several steps that must be taken in the Student Management in planning learners. Such measures include: forecasts (forecasting), formulation of objectives (objective), policies (policy), programming (programming), outlined the steps (procedure), scheduling (schedule) and financing (bugetting).

Educational Facilities and Infrastructure Management. Some alternative ways of procurement of facilities and infrastructure in MA Az-Zahri Tlanakan Pamekasan conducted by: the purchase, manufacture their own, receiving grants or assistance, lease, exchange and repair. Repair is a way of fulfillment of school facilities and infrastructure are relatively often we do, both with one unit improvement of facilities and infrastructure as well as with the exchange of the instruments and finally one or several

units of facilities and infrastructure can be operated or used again.

The purpose of maintenance. Thats are a) to optimize the life of the equipment. This is very important especially when viewed from the aspect of cost, because to buy a piece of equipment would be much more expensive when compared to taking care of part of the equipment; b) to ensure the operational readiness of equipment to support the smooth running of the work in order to obtain optimal results; c) to ensure the availability of the necessary equipment through routine checks and regular; d) to ensure the safety of people or students who use these tools.

The Benefit of Maintenance, thats are a) if the equipment is well maintained, its age will be preserved, which means no need to hold a replacement in a short time; b) maintenance of a good result in infrequent significant damage repair costs can be reduced to a minimum; c) with the proper care, it will be controlled so avoid losing; d) with the proper maintenance, it is unsightly and seen; e) maintenance of good results good job.

CONCLUSION

Based On the basis of the discussion of the results of the study can be drawn some conclusions as follows. Planning learners in school of MA Az-Zahri do some considerations in the selection of these activities. First, with regard to the activities of the selected student. Second, the possibility of the activities carried out in terms of effort, cost and infrastructure are owned by the school. Third, with regard to the time available. Fourth, regarding the inhibiting factors to achieve it.

Some alternative ways of procurement of facilities and infrastructure in school of MA Az-Zahri conducted by: the purchase, manufacture their own, receiving grants or assistance, lease, exchange and repair. Repair is a way of fulfillment of school facilities and infrastructure are relatively often we do, both with one unit improvement of facilities and infrastructure as well as with the exchange of the instruments and finally one or several units of facilities and infrastructure can be operated or used again.

Preventive care infrastructure was also performed in school of MA Az-Zahri, the treatment was performed at specified intervals and implementation is done routinely with some predetermined criteria.

The goal is to prevent or reduce the likelihood of facilities and infrastructures are not working normally and help the infrastructure can be activated in accordance with its function.

Preparation of revenue and expenditure planning in MA Az-Zahri carried out in accordance with the applicable rules. Financial planning program emphasizes analysis of activities according to the vision, mission, purpose school, specify the source and amount of the budget, and determine the amount of budget for each activity performed within one year.

Promotion Process School Community of MA Az-Zahri shooting went well according to the procedure that had been programmed. To further ensure the effectiveness of promotional activities of the school, it is done by a particular team responsible for the implementation of promotional activities of the school.

The role of the principal in high school Mobilising Community Support MA Az Zahri is very important. The school principal has been able to demonstrate its ability to develop the potential of schools, teachers, and students to achieve maximum performance. The principal's leadership to implement effective and can improve school performance by demonstrating its ability to manage the school.

CHARACTER DEVELOPMENT MODEL-BASED LEARNING ICT SMP PADANG CITY STATE

Muhammad Sahnan, Ashabul Khairi

e-mail: Sekjur.pgsd@gmail.com

ABSTRACT

This research is motivated by the policy towards learning the character in the implementation of the national education system and the provision of curriculum enactment in 2013 which put pressure on the junior-oriented learning in ICT for all subjects. Samples used in this research is purposive sampling, with a sample of teachers who teach in grade VIII of SMP 1 Padang, Padang SMP Negeri 2, and SMPN 8 Padang, special teaching for five subjects, namely Indonesian, Mathematics, English , science and social studies. Data collection techniques used were observation, interview and documentation study. From the research, conducted by researchers discovered that the character has not been effective ICT-based learning. This is due in teacher learning is still often give priority to the cognitive aspects, so that the values of the characters that must be invested not in place. As efforts, researchers characterized the development of the ICT-based learning model that is based on scientific learning

Keywords:character learning model, ICT based learning

The change of the learning system in force in the curriculum in 2013, which led to the application of the learning system oriented character formation of students has been a beacon of hope for the continuing development of the Indonesian nation. This is due to an expectation that the learning of character capable of tackling the problem of moral decadence that occurred in the younger generation. Even deeper, learning policy has become a formula in order to create the figure of generation plenary able to raise the dignity of the nation.

Problems of moral decadence younger generation is not something that should be kept secret anymore. At least, every day from various news media constantly exhibited immoral acts committed by children and adolescents, such as; brawl between schools, vandalism by students, free sex behavior, theft, robbery and porn video case that turns out 90% of perpetrators and the manufacturer are children and adolescents. This condition is more pronounced, when the problem of HIV / AIDS is a frightening object for society, precisely the fact that based on data from the Directorate General of Health community that one-third of AIDS patients are young people whose future is still quite long. Many people tried to respond and seek to provide a solution, but in the end all the answers focused on one aspect of that criticism of the education system. Education is necessary to pay more attention to the level of emotional and moral development of their students. This is considering the implementation of education has been more impressed highlight aspects of cognition with

emotion and ignore the moral aspects of learners.

Basically, the implementation of education at the school is a formal process of acculturation, or the process of acculturation. The process of acculturation is not merely cultural transmission and cultural adoption, but also a cultural change. As we know, education leads to a variety of changes in the field of socio-cultural, economic, political, and religious. But at the same time, education is also a tool for cultural conservation, transmission, adoption, and cultural preservation. To that end, the success lies entirely on the character education implementation in schools through the application of learning that upholds the hope to realize the character generation.

Character education should be given to the learners well. In this case, teachers practice in school education are expected to conduct learning activities that attract more attention and easy to understand learners and conduct regular evaluation of all components that include values in character education. As the opinion Koesoema Doni (2010: 205) that describes the values of character education includes religious values, moral values, common values, and the values of citizenship. To that end, the development of character values in learning, developed in an atmosphere of learning, as usual, through the process of integrating the learning materials that contain the element of character values such as Pancasila and Citizenship Education (PPKn) and Religious Education.

Implementation of character education in the classroom learning in each educational institution is bound to meet obstacles and challenges. Various obstacles will be overcome respective educational institutions in a way that is not the same. Even between one class with another class in the school is not necessarily the same in implementing the

curriculum of characters that are still new. Especially at the level of secondary school (SMP), one of the obstacles that will be experienced teachers is to determine the character-based learning model information and communication technologies (hereinafter ICT). Recalling the 2013 curriculum policy has determined the application of ICT-based teaching character education for junior high (Public Test Materials Curriculum 2013 Kemendikbud, Slide-24).

Needed an effort to face the obstacles that will arise in the application of ICT-based learning in junior high character for teachers. Moreover, if the review of aspects of the learning ability of teachers for these have a tendency not dare try to innovate the application of learning models, it would be problematic starting point for teachers in implementing ICT-based learning character. This condition is also further complicated by lack of specific guidance in character-based learning implementation of ICT for teachers in junior high.

Unavailability of specific guidelines of ICT-based teaching practices characterized for teachers of SMP is an indication yet as effective implementationcorrelated curriculum, 2013 in junior high school. So far, guidance provided is the Implementation Guide Character Education in Junior Year 2010 new elaborate on the importance of the implementation of character education in junior high school and have not touched on the specifications of ICT-based learning character in accordance with the curriculum policy in 2013.

In the document Free Character Education at Junior Kemdiknas (2011: 43) explained that the application of learning in junior high character refers to the principles of contextual learning (Contextual Teaching and Learning). However, in practice certainly requires a mature strategy formation that pencapian character values can be delivered with an integrated in ICT-based learning. As Koesoema Doni (2010: 177) explains that an important prerequisite success of character education is the formation of teachers. Then planting values in character education can be implanted by a junior high school teachers through ICT-based learning model character. Where, learning activities that reflect the character education should be planned carefully with based on the use of ICT as a learning orientation lest ICT media are used instructional materials became unable to support the planting of character values desired. In connection with that, it would need to be formulated learning model that can

accommodate the application of ICT-based learning that reflects the character of the planting of character values.

METHODS

This study was designed to assess the need for an ICT-based learning model character as a reference or guidance in instilling the values of character that is integrated in all subjects for group A in the curriculum, 2013 in SMP. This research will be developed ICT-based learning model character in accordance with the conditions of students in junior Padang. The study sample was SMPN 1 Padang, Padang and SMP Negeri 2 SMP Negeri 8 Padang. To build the model required in-depth study of the components involved in the lesson, including syllabi, lesson plans and learning evaluation. The study also involving the parties involved in order to develop learning model is meant as experts, teachers or educators and learners. Therefore, this study was designed using the research approach or the development of research and development (R & D). According Sukmadinata (2005: 167) R & D methods have an idea combines three methods of mutual support for the birth of a model that is a preliminary study, evaluative at this stage of the process of testing the model and experimental at this stage of testing the efficacy of the model.

Sugiyono (2009: 407) states that Research and Development is a research method that is used to produce a specific product and test the effectiveness of the product. The same thing also expressed by Borg and Gall (2003: 772) that is the development of research-oriented research to develop and validate the products are used in education. In the development of ICT-based learning model character, the research carried out with the intention of linking theory or existing policies with reality (practice) field and then developed into a better direction to be a learning model. Where, in this study learners and teachers are invited to apply the learning activities based on the application of ICT-based learning concept to integrate with the planting of character values and attempts to practice these values in their daily lives.

The method used in this research is qualitative methods, with a view to finding widely and deeply about the application of ICT-based learning model character in junior Padang. With qualitative research, researchers will see firsthand about the application of ICT-based learning in junior high characterless city of Padang implemented, the researchers will obtain the necessary data in order to develop ICT-based learning model character. In addition, qualitative research also emphasizes the descriptive aspect is based on observation, interview and documentation described by all the factors that were observed and

studied on an object that is associated with the quality of the character of ICT-based learning model in the Junior Padang. As revealed by Satori and Aan Komariah THIS NOTE (2009: 22) that qualitative research is research that emphasizes the quality or the most important of the nature of the goods / services.

RESULTS AND DISCUSSION

Observations and interviews directed to two aspects: 1) aspect of the implementation of ICT-based learning character; and 2) the aspect of availability of learning tools and learning resources ICT-based learning support character. For the aspects of the implementation of ICT-based learning focused on the character of learning strategy, the efforts of teachers in instilling the values of character, integrating the lessons and values of character, the problems faced in implementing the learning and learning media are utilized. While aspects of the availability of learning support and learning resources focused on supporting school activities teaching character, facilities that support the ICT-based learning, the availability of writings Reflectingcharacters and places of worship. From observations and interviews found the following results:

1. Findings of the Character-Based Learning Implementation of ICT

In observational research, teaching teachers doing character class always begins with a greeting and invites students to say "Bismillahirrohmanirrohim". Habits often happens in the classroom is not a lot of students who answered greetings from teachers and as well as when the teacher invites students to say "Bismillah" before starting the study. However, it was not all teachers do this, the tendency is precisely the majority of teachers are only enough to say hello, even some teachers who do not say hello. These conditions were confirmed by investigators to interview teachers, whereby when investigators questioned about "how teachers begin learning to watch the 2nd and the next hour?". The questions, most answered by the teacher by asking readiness of students to continue learning and some teachers who responded by asking the health of students. Only a small proportion of teachers who responded to start learning to say "Bismillah" together.

As teachers do perception by asking questions to the students about the last week of learning materials and an explanation from the teacher to the material, it was found that not the slightest teachers emphasize integration character values on the material that has been learned last week it was. The same condition is also displayed by all teachers in delivering learning materials to be studied, where teachers only explain such material without any mention of character values are imparted to learners. According to the teachers through interviews that the emphasis of character values still delivered to all of the material, especially in science subjects, social studies and Indonesian, but things are different for the subjects of English and Mathematics. Submission of character values that are integrated with learning materials for teaching English and Mathematics can only be done on a certain material, such as for teaching English material on "Greetings (Greetings / Acknowledgements / expression request)" to display images about someone who helped grandmother to cross the street and see a sick friend, or for material "shooping List", whereas the values of characters that can be integrated with the material in the subjects of Mathematics as in the case of the embedded character values such as honesty, discipline, rigor And Responsibility.

The efforts of teachers to instill character values to learners, from the observation of researchers found in three new school is that the efforts of teachers by instilling the values of discipline, awareness among fellow, responsibility for the cleanliness of class and honesty in making task by the teacher. This is consistent with the results of the interview, where teachers explain the discipline of learners in the learning followed by not doing noisier during learning, and provide assistance to another friend in distress.

In terms of implementation of learning strategies from the observation the researchers found that the learning activities conducted between teachers together learners by presenting questions about the information submitted by teachers teaching to the students, and then interspersed with explanations. The learning activities like this almost all the teachers implement the third junior to all subjects. This is consistent with the results of interviews with all teachers, but the learning activities is constrained by active learners. The results of the observations the researchers looked at the persistence of the learners indifferent and unconcerned with the teacher, there is even a play. This condition is also emphasized in interviews with teachers that active learners in learning to be a problem, but it is different with interviews and observations by teachers at SMP Negeri 8 Padang. From the observation of learning activities in SMP Negeri 8 Padang really alive, the students are very enthusiastic and passion in answering questions of teachers, even students dared to explain the learning materials in the classroom, because the teacher as a facilitator continues to provide opportunities to students who were never active in order to be active, as described

by the subject teachers IPS that "if there are children who never answer and ask then we will tell him to ask, and if necessary explain", as well as with teachers teaching science "if necessary, we asked who never ask and answer". Thus, it is understood that the problems faced by teachers in ICT-based learning in junior high character is a matter of active learners. For utilization of instructional media, researchers conducted observations on the implementation of teacher learning is generated that most teachers use more of the board, because it needs sufficient learning materials presented by the board, as described by teachers in an interview with investigators.From the foregoing, it can be concluded that the implementation of ICT-based learning in junior high characterless city of Padang has not been fully able to increase the passion and motivation of learners as expected. Emphasis cognitive remained the main core of teachers in implementing ICT-based learning character, even the orientation of ICT in learning is not yet vital needs of teachers in presenting learning material information.

2. Findings of the Study and Supporting Devices Learning Resources

In observation of researchers, found that support the successful implementation of ICT-based learning character derived from the infrastructure and facilities, learning activities in schools and the teacher teaching and learning resources on each SMP provides a very good impression. At SMPN 1 and SMPN 8 Padang Padang, learning activities in schools began with the reading asamul husna by all learners and study and pray, as defined by each waka curriculum in an interview with investigators. The same condition also occurs in SMP Negeri 2 Padang, where before the start of the first hour of learning the students are invited to pray together.

For the aspects of infrastructure such as classrooms soundproof and availability projector (infocus) for each class, especially in SMP Negeri 1 SMP Negeri 8 Padang and Padang is very good. Almost all the rooms with soundproof conditions and normal lighting, almost all locally available infocus. However, in SMP Negeri 2 Padang condition of classrooms in the observations researchers have been unable to support the learning of ICT-based character due to the condition of each class that have not provided infocus and soundproofed.

In his observations, the researchers also found writings that reflect the values of the characters on the learner's third junior high school. Posts hung on along the verandah of the teachers / principals and learners' learning space. From the observations of researchers, there is even a paper written by three languages (Arabic, English and Indonesia) as contained in SMP Negeri 8 Padang. In each SMP that we studied, it also provides space worship / prayer room and added more honesty canteen, where every student must take food that has been provided by the school and put the payment under the price of food which has been determined in a a city / box that has been provided in addition to the food place.

Planting of character values by the school, is not merely a theory but in practice, the school also provides a means of open learning space for students to study together with classmates or sister levels as contained in SMP Negeri 8 Padang. It shows how the schools to instill the values of togetherness, caring and kinship.

It can be concluded that the teaching and learning resources that support successful learning character-based ICT in each junior high school was very good, but when examined findings on the implementation aspect of learning character-based ICT gives the impression that all the facilities of infrastructure has not been optimally utilized by teachers and learners. As far as researchers have observed, the implementation of ICT-based learning in junior high characterless city of Padang is really effective is implemented in SMP Negeri 8 Padang.

3. Character Development Model-Based Learning ICT

Based on the research findings can be described that character of ICT-based learning in the city of Padang SMP has not been able to form the character of the students. Learning focused on achieving success whilst only cognitive psychomotor and affective domain has not been reached. In fact, in the implementation of active learners learning problems become the problems that hinder the success of learners, although there is one junior high school student participants' level of activity in learning quite well. For that, is necessary to develop learning model character to overcome any weaknesses. At least in the perspective of the researcher, there are four things that should be a concern of researchers in developing the character of ICT-based learning model in the Junior Kota Padang, namely:

a. Active learners

b. Achievement of competence psychomotor learners

c. The achievement of affective competencies learners

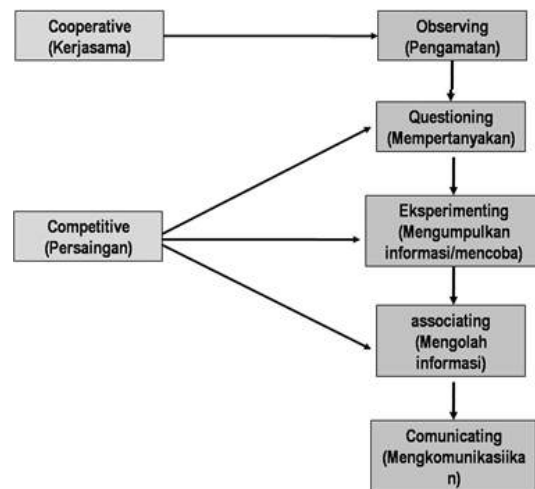
d. Oriented ICT as a learning ground character.

Basically, the general principle is prioritizing ICT-based learning principles of interesting, stimulating, challenging, effective and efficient and stimulating. Even the level of communication between teachers and students is optimal, if ICT really into learning basic character. However, in the observations of researchers, the main core to be able to overcome the four problems above boils down to active learners. To that end, based on the initial discussions of researchers agree on the character development of ICT-based learning model, the researchers chose scientific learning model with the addition of the element of cooperation (cooperative) and competition / competition among learners. The point is that learning is presented by teachers who only acts as a facilitator and motivator with learners who collectively understand the lessons and values of the characters contained therein. The cooperation process occurs only at the stage of observation.

The process of learning is done by way of competition / rivalry is where the teacher made a competition to students who want to actively ask, answer or explain further active learners who dare will be given an additional appreciation of the value for the success of the learning process. As an initial concept, each liveliness has a level of appreciation that is different, an example of active asked appreciated the checklist or one star and for the liveliness answer and explain appreciated 2 checklist or 2 stars, where a checklist or a star is worth the extra value of 5 for the success of learners that own. It is intended that each active learners not to be in vain for him. However, to make it more effective ICT-based learning character then the teacher should remain direct answers and explanations learners, so that only the answers and explanations which leads truth that can be appreciated by the teachers in the form of value addition. Moreover, teachers should continue to provide opportunities for learners who are less active.

The addition of the elements of cooperation and competition is expected to grow a high motivation in self-learners to engage in learning, not only to master the cognitive but also in achieving psychomotor abilities even affective, for each active learners both in the area of cognitive or psychomotor or affective be rewarded with adding the value of learning. The process also, it should not be in the spirit of the psychological pressure of students but establishes a personal conscious of itself and its future. However, learning model has been formulated researchers must also be strengthened by the idea or ideas of the teachers

as a form of contributions to the development of ICT-based learning model character.

The following description of the development model characterized by ICT-based learning:


The learning model is developed to realize characterlessICT-based learning concept is to combine some of the elements contained in the medium of learning, namely: the material as a major part of learning, as well as the values of the characters, and the use of ICT itself in the development of instructional media. Media is packaged in such a way with regard practicality in use, as well as aesthetic value attractive layout and the most important is the charge of material relevance serves. The idea of character development of instructional media produced in the form of products shown in the following figure.

The idea of character development of instructional media produced in the form of products shown in the following figure.

Figure 1. Cover page   Figure 2. Media Home Page

Figure 3. Page Content   Figure 4. Page Character

The formulation of ICT-Based Learning Activity Character in SMP

1. Observations.

Learners are directed to observe a real object, through a medium of learning. Activity observed priority meaningfulness learning process (meaningfull learning) for it should be done jointly, and it is expected that learners can share an understanding of what has been observed. This method has certain advantages, is students who do not understand can be understood and learners who understand the more familiar. In its activities, the teacher must first form a group of observers, who will observe the real object together and will share the understanding of fellow members of the group led by the chairman of the group. In this case the focus of attention from the teacher to evaluate the attitudes of cooperation among learners in one group.

2. Ask

The second activity is asked. Before the process begins to ask, each learner will be given the opportunity to seek a question from the object that has been observed. Questions are presented for all learners in the class led by a teacher. This is done so that every student has a chance to answer. During the activity ask, teachers remain analyze questions and answers learners to remain focused appropriate learning objectives expected. Next, the teacher will provide additional clarification or reinforcement of the answer if deemed correct. By giving students the opportunity to ask or answer expected to foster an atmosphere that is intimate and fun learning. In asking the question to be a quality question. Quality question will produce quality answers.

3. Trying or Gathering Information

Try activities or gather information into the third activity after asking. In this activity, students are given the opportunity to try out or gather information about the core learning material they are learning and character values contained in the material. Every trial and described the information gathered in the classroom and will remain appreciated by teachers as a form of competition into active learners. In this case, the teacher still guiding explanation learners to not run away from tourist destinations is expected, so the only explanation is true that would be appreciated. This condition will develop affective, psychomotor and cognitive learners to associate the material with character values contained therein.

4. Information Processing

The processing of information in a manner invites students to bring an idea or opinion about the classification of information in accordance with the material that has been discussed and character values that have been understood. This activity can be done in groups or individually and still appreciated teacher for every opinion emerging from learners. This activity can also be done by the teacher presenting media objects that can be responded by the students of the object.

5. Communicate

This activity is strengthening against what students learn, teachers provide opportunities for learners to ask for a response to the information that has been He grouped to friends and teachers. This measure gives an advantage to students in developing self-confidence and seriousness in learning. By communicating the results of the experiment and its associates have carried learners in learning will strengthen students' mastery of subject matter that has been presented in the study.

CONCLUSION

Based on the findings in the first year have been describedabove it can be concluded that the implementation of learning character-based ICT in SMP city of Padang in order of value investment character of the students have not been implemented as expected, because the teachers have not been able to achieve success for all three domains learning (affective, psychomotor and cognitive) are only focused on the success of cognitive domains only. The model will be developed by the researchers is scientific learning model that will be developed with the addition of elements of cooperation and competition.

PRINCIPAL VISIONARY LEADERSHIP IN ORGANIZATIONAL CULTURE

Muhammad Ubaidillah; Ali Imron; Bambang Budi Wiyono; Kusmintardjo

Post Graduate Program,State University of Malang, Indonesia
Email: ubaidillahmuhammad01@gmail.com

ABSTRACT

This study aims to determine whether the principal visionary leadership in organization culture. Leadership is the power of aspirational,creative and moral force that is able to influence the members to change the organization culture attitude. The strength and excellence of the properties of the leader is ultimately a psychological stimulus that can cause a collective reaction of subordinates. Next will come obedience, loyalty, cooperation, and respect of the members of the group to Leader. Leaders must know exactly what you want to achieve (the vision), visionary leaders deeply understand how important it is to engage all stakeholders in organizaition to realize the vision of the future. Implementation of the visionary leader must have competence to carry out a number of missions to achieve their vision, and then the leader must have the characteristics and the role for future more advanced

Keywords : *visionary leadership,principal,organizational culture*

The dynamics of culture and nature of organizational culture should be built, how much more to support the implementation of regional autonomy, is the ability to grow the mental models that have the emotional strength to motivate the principal leaders of achievement and individual involvement in the success of the vision he had. In addition to the formal requirements such as quality of a person's integrity leaders are characterized by having the quality of faith and piety (IMTAQ), mastery of Science and Technology as well as skills and excellent physical qualities, has a great energy and was able to redirect that energy underling. Energy emerges from a strong personal conviction, motivate the organization and continuous change.

In organizations, a leader has taken effect. Not only to lead, a leader should be an example and driving the lead. A person can be said to be a visionary leader in producing educational productive, if during the performance of his responsibilities as a leader able to manage the process of education is constantly creating innovations with the resources available have managed to create the appropriate output to the vision and useful become competent human resources in line with expectations or desire of users of educational services, where the results can create graduates who have the benefit of the people who do it in the form of abilities, skills that are relevant to the lives and can help themselves and their families life, able to create social benefits as a result of understanding all graduates to create life quality and proper environmental.

According Kantabura (2010) that corresponds with the vision necessary creative leader, is responsible for making the vision. The steps; First, communicate and promote a vision for harmonize the order to support the system, including the system of recruiting and teamwork. Second, empower people to act consistently with the new vision and helps commitment maintain Third, helping motivate all stakeholders to work towards the desired vision or inspiring. Effective leaders motivate by setting goals.

According to Robins (1998) visionary leadership is the ability to create and articulate a vision that is realistic, credible and attractive about the future of the organization or organizational unit, trustworthy continue to grow and increase compared to today. This vision has a clear and encouraging, which offers an innovative way to improve, which recognizes and is based on tradition and related to measures that could be taken weeks to realize the changes.

Where the need for principals to implement visional. School principals leadership plays an important role, and is decisive in achieving organizational objectives previously set. A school head may not be able to work alone. School principals need the other organizations that are driven such that given dedication and contributions to the organization. Such devotion can be realized by working in an efficient, effective, and productive so that the objectives and vision of the school is reached. Principal leadership is so strong impact on the performance of the organization so rational when adversity education one of them caused the performance leadership of principals who do not adjust to the change and does not make education strategies that are adaptive to change. Because the

principal is an educational leader who has a great responsibility in the organization of education in the school.

Principals characteristics should be able to push the performance of teachers by demonstrating a friendly, close and full consideration of the teachers, both individually and as a group. Because the principal as a facilitator for the development of education. The school principal as the executor of a task laden with hope and renewal. So principals are required to have an idea that continues to grow, especially in the strategy of improving the quality of schools. Because the noble ideals of our educational indirectly also handed over his responsibilities to the principal.

Visionary of Leadership Principal in Organizational Culture

There are three terms that is a leader, lead and leadership. Leaders are people who can influence others, so that people who are affected will support the goals of the group. The leader is guiding, implementing, and directing. A visionary leader able to anticipate all the incidents that may arise, to manage the future, and encourage others to act in ways appropriate.

According Rosmiati (2009) leadership is a donation from someone in the situations of cooperation. Leadership and group are the two things that cannot be separated from each other. There is no group in the absence of leadership, and leadership otherwise exist only in situations group interaction. One cannot be said to be a leader if he is outside the group, he must be in a group in which he played a leadership role and activities.

Therefore, put the leadership position to unite art and science of individuals and groups in order to follow the orders of a leader in an educational organization. Became leader orders collective of institutions that have a certain size and targeting accordingly. According to Maxwell (2008) mentions that the key of success productive leadership, namely: first, the influence. Ability to influence. Medium vision is a picture of what might happen, an ideal lodging for individuals or organizations who are not satisfied with what is already there (Komariah, 2008).

Leadership with vision or can be called visionary leadership, made up of two words, namely leadership and visionary leadership is influence others and build innovations directly in the organization. Namely visionary ideas that attempted to describe something based into the future and a show of strength to survive when setbacks or failures (Bennis, 1985). According Harefa (2010) visionary is a deep dissatisfaction

regarding the factual reality of today coupled with a sharp view on the possibility of creating a new reality in the future, which is fundamentally better.

According to Hofstede (2010) cultural organization is an arrangement of collective thinking that distinguishes the members of an organization to another. According to Mansor and Muhammad (2010) organizational culture is a complex set of beliefs, assumptions, values and symbols that are used in determining the way in which the organization manages. Organizational culture can be an instrument and a major competitive advantage, when the organizational culture can support the strategy of an organization, and was able to answer and address the environmental challenges accurately and quickly.

As a leader seen as capable of influencing and motivating positive to its employees through the authority and position; ability to maintain, organizational culture and create order, order for its employees. Visionary leadership orientation will appear on the attitudes and behavior of leaders who understand the vision, mission and strategy of the organization, personal integrative and proactive, love and engage in change and always update the information by networking widely.

According Yulk (2010) argued that the ability to perform actions strategic leader relies on historical factor organization (organizational culture) that is affected by changes in the external environment (technology development), strategy development and increased consistency between strategic organizational structure, culture and human resources. An organizational culture serves as social glue not only the discourse but must be implemented in a concrete way for the creation of life together in an organization.

Cultural issues are one thing that is essential for an organization, because it will always be associated with the institution. Organizational culture is one tool that can unite intercourse between leaders and their employees, that with the culture will make employees feel themselves part of the organization. According Khan (2012) stated organizational culture has a positive and significant impact on the performance of employees, and it is getting stronger culture of the organization, the higher the performance of employees.

According to Robins (1998) examines the impact of organizational behavior to individual, group and structure have on behavior within organizations for the purpose of applying knowledge to improve organizational effectiveness. Behavior in the organization comes from two sources, namely; individuals and groups. Group behavior and interpersonal influence also provide power for the performance of the organization. As environmental change institute intensifies,

creativity and innovation has become a major activity and routine for the organization.

Specific characteristics Visionary of Leadership Principal

There are some opinions from experts about the characteristics possessed by visionary leaders. According Sashkin (1998) mentions a visionary leader has three characteristics, namely: (1) thinking into the future, (2) establish and describe vision clearly and develop methods to achieve this vision, (3) engage with others in seeking support for vision.

In line with Nanus (1992) asserts visionary leaders is an effective leader who has among other characteristics; (1) always has a plan, (2) oriented full on results, (3) adopt new visions that challenge, needed, and can be reached, (4) communicating the vision, (5) influencing others for support, (6) eager utilize resources to realize the vision.

According to Singh (2012) the characteristics of the best leaders are: empowering, knowledgeable, inspirational, visionary, confident, assertive and helpful. Characteristics of "bad" leaders are: manipulative, selfish, dishonest, unapproachable, condescending. According to Bennis (1995) that the leaders work to manage. The leader's ability to create a vision and translate into reality the so-called visionary leadership is an interesting target, resulting in the commitment of all the personnel to make it happen.

Further according Zamroni (2011) organizational culture or the culture of the school that has four characteristics, namely: (1) culture is a special school, because each school has a history, communication patterns, systems and procedures, vision and mission statements; (2) the school culture is essentially stable and usually slow to change, school culture will change when there is a threat of crisis from another school; (3) school culture generally has a history that is implicit and not explicit; and (4) the school culture appears as a representative symbol of the underlying beliefs and values of the school. Knowledge and courtesy of the personnel of the school / madrasah which is accompanied by the ability to gain the trust of anyone, who would give a convincing impression for others. This dimension requires teachers, staff and school heads skilled, professional, and well trained in playing its role to meet the demands and needs of students, parents, and community.

Culture positive of visionary leadership will create an atmosphere conducive to the achievement of the vision and mission of the school, and vice versa negative culture will make achieving the vision and mission of the school / madrasah run into many obstacles. Visionary leadership culture is a good example willingness to appreciate the work of teachers and employees. Seriousness in carrying out duties and responsibilities, the motivation to continue to excel, commitment and dedication to his responsibilities. According to Lee and Kim (2013) visionary leadership culture to inspire, reflect the positive values, and encourages commitment to the organization in the future. The approach focuses on the growth of the visionary leaders of schools where flexibility and continuous improvement is a major aspect for the success of the school.

Visionary leader is a leader learning to act as a problem solver, provider of resources, and a spokesman with the many roles in managing the school's vision that will move towards a better future. The school principal visionary who led with a powerful vision did not feel afraid of stating this is something that I believe; this is something that can be perfected by the school.

Vision is the driving force that guides, directs and facilitates achievement. The qualities of a visionary principals, other than he was able to see and take advantage of opportunities in the future, he also has the leadership principle. Therefore, an education unit must have principals who possess extensive knowledge and competence to be able to formulate and bring the school in accordance with what is envisaged. Vision must be stated clearly.

Vision definition should use simple language, it means easily understood and implemented by all parties, as well as instructive. That is the vision set forth encourage all schools to realize component. A good vision for the school is a reasonable, tangible, and not too difficult to achieve, as well as meaningful for everyone.

According to the Beach (1993) describes the vision of the ideal future, implying that current organizational culture memory and the activity or change. Vision is an ideal future, may be the retention of the cultural and organizational activities ongoing or can be in the form of change. According to Thomas (2011), although very varied vision, a vision statement that inspires and motivates have certain characteristics as follows.

1. Brief; vision statement is not made in sentence length, but in brief, easy to read and understand, and can often be communicated.

2. Clarity; vision must be clear, does not contain a different interpretation of the reader. A clear vision statement may affect the acceptance and understanding of those who receive.

3. Abstraction; vision is not operational goals that can only be pursued and achieved in a short time, but the ideal expression of the ideals of the

organization that accommodates the progress of the organization.

4. Challenges; a good vision statement formulated by challenging the ability of personnel. Personnel who are challenged may indicate optimal performance and establish a sense of confidence,

5. The future orientation, the vision is the future. The future vision is the quality of all aspects of the organization.

6. Stability; vision statement is not easy to change because he can accommodate the change, interests, and desires of the organization in a relatively long period of time so that changes that occur outside the organization do not make threats to the organization's vision.

Preferably, vision should be favored Hidayah (2016) Characteristics of visionary leadership is divided into seven, namely;

1. Insightful Visionary (future oriented) and able to deal with the future. Insight into future oriented as the visionary leader is always led by the vision of the entire life cycle of the organization he leads. Vision serve as a pointer signs that have the power to inspire action and help shape the future.

2. Strategic thinker and planner. As a strategic thinker, they must have the ability to formulate a clear vision, inspiring and evocative. As a strategic planner, a visionary leader to plan ahead to make the best step. Planning meant creating a strategic plan of action with specific strategies in mind.

3. Innovative and daring to take risks. Leaders are specifically noted to change old mental maps, and the ability to think out of the box. They have the ability to think quickly when solving problems because their thinking is widespread and systematic, look at the big picture, the whole system, and they then make strategic innovative ready to risk to achieve their vision.

4. Imaginative. Visionary leaders are able to make the mental leap that takes what have now become what could or should be.

5. Optimistic and Enthusiastic. Visionary leaders working on the premise that this is the best time to live, that the world is full of opportunities and that most of it was possible. It has a strong flavor, has a lot of control and confidence that success, especially to me.

6. Employee empowerment. Visionary leaders see each other as a valuable asset that must be considered and develop their professionalism through education and training.

7. The best communicators. Visionary leaders have the ability to articulate clearly to all stakeholders at the big picture and focus on organizational objectives. Visionary leaders through effective communication with employees and the public both verbal and nonverbal means building a good relationship and can motivate all stakeholders to build a culture of team work and make changes. As a good communicator, they must know how to verbalize dreams and goals and can explain to the team. Communication is not just one side. In addition to sharing his vision for the future, a visionary leader is also an active listener.

Visionary Leadership Role Principal

Role is a dynamic aspect of the position. If a person is exercising its rights and obligations in accordance with his position, it means he's running a role. The difference between the position and the role is for the sake of science. They cannot be separated because one depends on the other and otherwise. According Hidayah (2016) defines the role as a complex human hope against individual how to behave and act in certain situations based on the status and social function.

Cannot be denied that a person's behavior strongly colored by many factors, as well as the perception of these factors. Perception that owned it was precisely that determines the shape of the nature and intensity of its role in the organization's culture. Diversity personality that is exactly what became one of the most serious challenges to be faced by every visionary leader. Then, the ability to face the challenges it was also one of the most important indicator, not only than the effectiveness of personal leadership, but also the toughness of the organization he leads.

According Nanus (1992) leadership and his visionary work in four important roles as follows;

1.Determinants Directions (Direction Setter)

Leader who has a vision acts as a determinant of the direction of the organization. As a bellwether, a leader conveys a vision, communicate, motivate workers and colleagues, and to convince people that what was done was the right thing, and support the participation at all levels and at all stages of the business into the future. While the organization was seeing the confusion facing various changes and new structure, visionary leadership appeared as a pioneer that determines the intended direction through the minds of rational and intelligent about the goals that will be addressed and directed behaviors moving forward towards the desired.

As a bellwether, the leader must be selected and set targets by assessing the external environment future mobilization destination entire organization's resources. He should be able to draw

up the steps toward the goal that can be accepted as a real progress by everyone in the organization. Because the leader is the decisive factor in achieving success for an organization. The successful leader will be able to manage the organization, can affect others in a constructive and able showing right direction and the actions that must be done together. There must be an absolute leader in an organization because the organization will not be able to run by itself without a leader that drives the organization.

Taken together, the visionary leadership to analyze the possibilities to be taken, the streets or the techniques and methods as well as resources that elected what can be used to achieve progress in the future. To become a determinant in the right direction, a visionary leader must have the ability to analyze the position. Is currently widely used SWOT analysis in order to find the position of the organization and further on sharing efforts with other personnel, ideals setting future organizational.

Leaders act as a bellwether, meant to give clarity to his ways or the effort that must be done, the steps which can be taken and the steps which should be avoided in order to achieve goals effectively and efficiently. Visionary leadership role is to guide the follower in assign direction to go in implementing the vision of the school.

Bellwether role, leaders must be able to provide the vision, goals, and objectives as a guide to the future. Without clear guidelines, a leader will fumble, arbitrarily without priority, and will be trapped in the uncertainty. Besides bellwether role also includes efforts to develop morale, good order subordinates are willing to give everything and not just working origin working.

2.Agents of Change

In his role as a change agent, visionary leaders are responsible for stimulating changes in the internal environment. Leaders will feel uncomfortable with the situation static organization and the status quo, he dreamed of an organization's success through the new buzz-buzz that trigger the performance and accept challenges by translating into employment agenda which clearly and rationally.

Visionary leaders are not satisfied with the existing one, he wants to have the advantage of that is like thinking how to develop learning innovation management schooling, cooperative relationship with the business world, and so forth. Of course, to produce innovations that reliable and leaders must be able to anticipate developments outside world, estimating the implications for the organization, and a priority

for the changes required by the vision of leadership. The role of the visionary leader is a pioneer and a trigger for various changes toward better in vision implies

3.Spokesperson

Effective leader is one who knows and appreciates all forms of communication are available, to explain and appreciate all forms of communication that field is available, in order to explain and build support for the vision of the future. The leader, as a spokesperson for the vision, must communicate a role that binds everyone to get involved and touch the vision of the organization internally and externally

Visionary leaders not only have the ability to convince people in the form of internal, but more away is how leaders can access the outside world, introducing and disseminating the advantages and vision of the organization which will have implications for organizational excellence. From the results of negotiations are expected to end up with the cooperation enchant morally although material. Is a visionary leader and a master negotiator in another organization-related higher, but not the kind of sycophant partiality toward people who are considered powerful, but instead he is close to the principals.

His speaking ability, along with the belief rational logics that the organization's vision interesting, useful and fun make it a great negotiator. Character visionary leader is to deliver basic thoughts, ideas, and writing so that they can communicate empathically in building commitment and conveys a variety of interests related to the implementation of the vision.

4.Coaches

Effective visionary leader must be a good coach. By this means a leader must use teamwork to achieve the stated vision. Leaders optimize the ability of all players to cooperate, coordinate activities or their efforts towards the attainment of victory, or toward the achievement of a vision of the organization. The leader as coach, brief the workers to focus on the realization of the vision by directing, encouraging, and building confidence in the players that are important to the organization and its vision of the future.

As a good coach, visionary leaders demanded patience and role models (which is based on the ability/expertise). In his role as a professional trainer should be able to develop the professionalism of the people they lead through the sharing of educational and training programs to improve the performance of their subordinate's quality. It performs strategic steps to transform the various innovations to stakeholders through the empowerment of staff and creating a system of democratic leadership that has vision of the organization as a formulation that is shared.

Visionary leaders as an effective coach must be able socialize well as in cooperation with the people to construct, maintain and develop the vision espoused, culture must be created, the behavior must be shown the organization, and the ways to realize the vision into the culture and organizational behavior. All of them demanded the leader as an expert / specialist who served as a coach who can pass knowledge on to others. The role of visionary leaders is giving an example or how strategic work.

Cultural organization or school culture can shape a person's adherence to the rules and create a new positive habits through the efforts of the enforced discipline of the school. School effectiveness can be judged on their efforts to create a productive organizational culture of the school, the culture that supports the growth of empowerment and independence of personnel in performing basic tasks and functions. Thus, in the school feels the nuances of growing value, habits resident's good schools, clean and discipline as well as the growth of the attitudes and behavior of all personnel who guided ethics and morals.

The role of visionary leaders as a professional coach also looked at the efforts made in implementing the vision into organizational culture or the culture of the school. School culture is an important aspect in the education system that gives feeling happy or sad, love or sorrow, passionate or lethargic, proud or disappointed and everything that involves one's feelings

As according Rival (2010) the role of visionary leaders can be divided into three parts; 1) The leaders of the future must be flexible and has an extensive experience, 2) assume spiritual responsibility as the head of an organization becomes necessary functions, is not a trivial thing to be experienced or delegated to others, 3) act effectively no longer be made centrally in the top of the organization.

According to Robert (2010) states that the role of the principal that success includes five functions, namely;
1. Visioning, with regard to the future as what is selected,
2. The creation of cultural meanings given birth identity in communities covered by the creation of the culture of the school and in the school towards a future that is based on strong values and timeless.
3. Adjustment elements of the organization supports the passage of a comprehensive implementation of school-based innovations directed at the vision advanced study

4. The distribution of power and leadership to encourage teachers and community members to be involved in the decision making process at the school.
5. External Cooperation and create a network of collaborative relationships with other schools and the public in the frame of the development of the school.

The success of the school depends heavily on the ability of the principal to lead with vision. Visionary leaders know what is best for students, schools and school communities and make decisions based on beliefs that are used to develop a vision. According to Murphy (1990), the visionary leader understands the direction and goals of the school, and decisions regarding future actions made by the school's vision. Visionary leader is someone who works to inspire and empower all people at all levels within the organization while leading the process of change.

Personal vision of the leader is the starting point for discussions about changes made together teachers, staff and stakeholders. Discussions of these changes led to the formation of a shared vision. Visionary leaders have the ability to use schools goal-setting to develop and raise the vision, through with stakeholders to discuss the agenda of a number of options and create a conducive learning environment for all students and the entire staff.

Visionary leaders to make sure that vision is focused on all the staff to be involved and understand their role is vital to the organization. Another aspect of the role of visionary leaders to give support to staff in understanding how to provide a productive teaching that will provide motivation for students to learn high.

CONCLUSION

Leadership is influence others and build innovation directly in the organization. namely visionary ideas that seek to describe something Based into the future and show the strength to survive when setbacks or failures. As the visionary leadership characteristics; (1) always has a plan, (2) full oriented on results, (3) adopted a new vision That challenge requires, and can be achieved, (4) communicate the vision, (5) to influence others to support, (6) eager harness resources to realize the vision.

While the primary role of visionary leadership in organizational culture is; First, leaders who have a vision serves as the leader of the organization's culture or the culture of the school. Second, in its role as a change agent, visionary leaders who are responsible for stimulating changes in the internal environment.

Third, the spokesman. Leaders know and appreciate all forms of communication are

available, to explain and appreciate all forms of communication are available, to explain and build support for the vision of the future. Fourth, effective visionary leader must have a good coach. Leaders optimize the ability of all players to cooperate, coordinate activities or their efforts towards the achievement of victory, or toward the achievement of the organization's vision.

THE MISCONCEPTIONSOF NATURAL SCIENCE (IPA) IN PRIMARY SCHOOL TEACHERS IN RURAL AREAS OF NORTH KALIMANTAN

Muhsinah Annisa

Universitas Borneo Tarakan

Email: echa.ok@gmail.com

ABSTRACT

The objective of this study was to identify the misconceptions of Natural Science (Ilmu Pengetahuan Alam) on primary school teachers in rural areas of North Kalimantan. This study employed a quantitative descriptive research. The population was the primary school teachers in rural areas of North Kalimantan that was Long Pujungan district, Malinau, North Kalimantan. The techniques used in taking the sample was a cluster sampling where 22 primary school teachers in rural area of North Kalimantan were taken. The instrument of this research was a written test in a form of multiple choice test equiped with the CRI (certainty of response index) answer sheet. The data were collected by distributing multiple-choice test which was consisted of 40 questions equipped with the CRI answer sheet and interview. Thus, this research result indicated that the teachers had got misconseptions about natural science concept, that is, force, light, and simple machine. The misconceptions were caused by the internal knowledge of the teachers themselves and the learning resources used by the teachers.

Keywords: misconceptions, natural science, rural areas

Since 22nd of April 2013, North Kalimantan is the newest province in Indonesia. There are 5 districts in this new province, which are Tarakan, Bulungan, Nunukan, Malinau, and TanaTidung. One of district that has various geographical area is Malinau, this district has 12 sub-districts. One of sub-districts that is located far from the city is Long Pujungan. This sub-district can be reached by boat within two days and one night. Because of Pujungan is far from the city center, this sub-district can be categorized as a hinterland. It is not easy to get communication access and transportation because of the location. So do access in the educational sector. Obviously, there are significant differentiation among cities and hinterlands in terms of learning resources and limited educational information. Furthermore, those facts are also supported by the result of questionning the head of UPTD at Pujungan explaining that education in Pujungan is still left behind other areas, which was also confirmed by an observation on 6 October 2016. The researcher observed teachers at the Elementary School 001 Long Pujungan and the result showed that their conceptual understandings of science concepts is still low. The teachers were given a set of questions to analyze but only a few answers were correct. Based on interview with elementary school teachers, there are no research in teachers' misconception in that

area within ten years. Chaniarosi (2014) has done a research titled "misconception identification of high school biology teachers grade X on human reproduction system topic" and found that there are also some teachers who experience misconception. Similarly, Wibowo (2016) also has done a research related science misconception at elementary school. This misconception can be identified using certainty of response index (CRI) method. This method was invented by Saleem Hasan in 1999. This method can be applied to measure respondents' certainty in answering question.

Those background shows that research in science misconception using CRI (certainty of response index)is important for elementary school teachers in hinterland, so teachers can understand science concepts thoroughly.

Science is one of disciplines that has characteristics similar with other disciplines. Each discipline, either has general characteristic also has specific characteristic. General characteristic of a discipline is facts and rules showing relationships between one and others. Those facts are arranged sistematically and stated with correct and certain language so can be searched for and understandable for communication.

Pardede (2010) mentioned some of specific characteristics (a) Science has a scientific value which means that the truth in

science can be proven again by every person using scientific approach and procedures as the inventor has done; (b) Science is a set of knowledge that has been arranged sistematically, and its implementation is limited to natural phenomenon; (c) Science is a theoretical knowledge; (d) Science is concepts that is intertwined; and (e) Science consists of four elements, they are product, process, application, and attitude.

Science product can be a fact, principle, theory, and law. Process is a procedure to solve problems. Application is the implementation of methods or scientific works and science concepts in daily life. Attitude is a curiosity of objects, phenomena, life creatures, and cause and effect correlation resulting in new problems that can be solved using correct procedures.

Science concepts in elementary schools are integrated concepts, because they are not separated, such as chemistry, biology, and physics. Science as a discipline and its implementation in societies has important impacts in science education. Teaching and learning should consider children cognition. Paolo and Marten (Samatowa, 2009:5) defining skill process as: (1) observing, (2) understanding what has been observed, (3) implementing new knowledge to predict what will happen, (4) testing predictions in some situations to verify the prediction. In science, students and other science learning should be sceptical because we have to modify models of nature in order to make them parallel with new findings.

One of misconceptions can be a pre knowledge, mistakes, incorrect correlation among concepts, intuitive ideas or naive. Novak (Suparno, 2013) defines misconception as concept interpretations in a statement that cannot be accepted. Brown (1989;1992) explains misconception as a naive view and defines it as an idea that is not appropriate with acceptable scientific definition. Feldsine (1987), found that misconception is a mistake and incorrect relationship among concepts. However, Fowler (1987), explains more specific about misconception definition. He thinks that misconception is an innacuracy definition of concepts, incorrect concept implementations, wrong example classification, different chaos concepts, and incorrect concept hierarchy. Hasan (1997) also defines that misconception is a cognitive structure (understanding) that is different from received understanding, and this cognitive structure disturbs the process

of receiving new information. From those definition can be concluded that misconception is related to innacurate science concept or definition from expert.

METHOD

This is a descriptive qualitative research. Descriptive research is a research that is describing or explaining real phenomena. (Sukamdinata, 2011: 72).

This research was done in Elementary schools at Long Pujungan from 1 October – 1 November 2016. The population of this research is all of elementary school teachers at Pujungan sub district. The sample was collected using cluster sampling. Teachers who were selected as samples are they who teach in SDN 001 Long Pujungan, SDN 002 Long Pujungan,SDN 006 Long Pujungan, SDN 005 Long Pujungan and SDN 008 Long Pujungan.

The instrument for this research is multiple choices questions. There are 40 questions in the instrument and the answer sheet is using CRI model. The data was collected using a tes with a CRI answer sheet. The options for certainty level has been modified to be more simple, which is from 6 scale becomes 3 scale. Those scale are certain, moderate, and uncertain.

The answers were categorized based on CRI criteria and presented based on three categorize, understand, misconcept, and not understand. The data was analyzed using an equation(Sudijono, 2009 : 43)

FINDING AND DISCUSSION

The result shows that elementary school teachers in the rural areas experience misconception in teaching and learning science. The percentage of teachers' answer can be seen in Table 2.

Data from Table 1 is presented in Graphic 1
Graphic 1. Misconception Data of Teachers in the Rural Area

Table 1 shows that there are 37, 45% teachers that experience misconception, 29,13% teachers do not understand the

concept, 14,19% teachers understand the concept but they are not certain, and there are 19,49% teachers that do not understand the concept. There are more than 50% questions (14 questions) showing teachers' misconception. Those questions are question number 2, 5, 9, 15, 18, 19, 22, 23, 24, 25, 26, 32, 39, and number 40.

Table 2. The percentage of test result on Elementary School Teachers in the Rural Area

Quest. No	Understanding (%)	Uncertain (%)	Misconcept (%)	Do not know the concept (%)
1	70,8	20,8	8,3	0
2	0	0	66,6	29,2

Rata-rata	29,13	14,19	37,45	19,49

Teachers experience misconception when they are answering question number 19, which is about the position of feather and marbles when they are thrown from a certain position in the vacuum room. There are 79.2% teachers assumed that the marbles fall to the floor first. Their answers were based on their experiences in their life without considering the vacuum condition. Some of other answer explaining that the feather and the marbles will be flying similar with astronouts who are on the space. In fact, there are no (small effect) of gravitation causes the

absence of air on space. However, the absence of air on the tube does not mean that there are no gravitation, because gravitation is an action on pulling objects (between feather and the earth and between marbel and the earth). Both objects will fall with similar speed and velocity. Since there are no friction with the air, therefore those objects will reach the bottom of the tube at the same time. The right answer is A, in which those two objects will reach the bottom of the tube at the same time.

Another misconception was also found in question number 25, in which there are 79,2% of teachers experienced misconception. The question was about a stone that is thrown into a pond. Water spreaded on the edge of the pound comes from the water that is closed to the edge. However, many teachers though that the water comes from the stone that fall to the center of the pound and from the bottom of the pound where the stone fall, that is because the teacher may think that the water spread together with the wave. Indeed, when the wave travel, the water only vibrates, so the correct answer is C. This also happens to question number 26, there are 79,2% teachers experienced misconception for the question related to audible tone and sound. The teachers have not been able to differentiate which one is the powerful sound and audible tone.

Based on interview with elementary school teachers, misconception occurs because of the limitation on learning resources, some teachers only use one book, even there are teachers that use book published before 2000. There is no variation on textbooks usage that can lead to the teacher misconception, it is also mentioned by Odom (Kustiyah, 2007) that the only one textbook usage will potentially cause teachers' misconception. This condition is dangerous because not only teachers that will experience misconception but also the students. Another misconception cause on teachers is related to their own knowledge. In which, the knowledge was built based on their thought and interpretation to the elementary school science concepts. Meaning that they understand does not fit to the expert so misconception is experienced. It is important to pay attention, because teachers who experience misconception will explain wrong concepts to their students. Similar with Woolfolk and Nicolich (1984) Hewindatidan Suryanto (2004) explain that

there are strong relationship between explanation and student achievement. Since there are low understanding of science concept in the rural are. Elementary school teachers in the other rural area are dominated by the one who graduated from seniorr high school who are doing their bachelor degree program, so their science concept are still relatively low.

CONCLUSION

There research shows that the there are only 37.45% teachers experianc missconvception. Misconceptions . Misconception o science susally can be found and read arefully. There are 37.45 % of teachers experienced misconception. The misconception can be found on wave and sound topic. The factor that cause misconception on teachers' understanding is teachers' thought that was coming from the textbook.

Hopefully there will be next research about misconception using different subject and concepts so the quality of Indonesian Education will be better in the future.

A STUDY OF GIFTED STUDENTS' ACADEMIC PREFERENCE AND THE IMPLICATIONS OF DEVELOPMENT PROCESS

Munawir Yusuf; Grahita Kusumastuti
Sebelas Maret University, Indonesia.
e-mail: munawir.uns@yahoo.com.id

ABSTRACT

Understanding students and their interest are important prerequisites for effective teaching. Moreover for gifted students who have special characteristic in learning than regular students such as kognitif, afective, and learning style. The purpose of this study is to identify preference of gifted students in academic interest. The academic interestsuch as science, social and art. The samples of this study are fifty-nine gifted students. This study used survey method with cross sectional approach. Data collected through by Rogers Academic Interest in Science, Social, Art questionnaire. Data analyze that used in this research is descriptive analyze. The result of this analysis showed that most of gifted students have academic interested in science. In addition, gifted students have less academic interest in art. The findings from this study can be used as a guidance for developing gifted students' academic interest.developing gifted students' academic interest requires internal or external support so that the purpose of this development can be achieved.

Keywords : preference, interest, learning, education, gifted student

Giftedness is an interaction among general and/or specific ability, high responsibility level of duty or obligation, and high level of creativity (Renzulli in Hawadi, 2002: 56). In line with the statement, United States Office of Education (USOE) (In Hawadi, 2002: 4) defines gifted children as children who can prove their high achievement in some fields like intellectual, creative, artistic, leadership or specific academic and those who need different service or activity served in school based on their ability. Gifted children's ability is different with other regular same-age-students and this makes talented children need education arrangement to build their potential (Hodge, 2013).

Giftedness possessed by someone is different with others, but it can be differed in five areas (Rogers, 2014). Those five giftedness areas are (1) Intellectual ability, (2) Specific academic ability, (3) productive creative ability, (4) psychosocial/leadership ability, and (5) visual and art ability. These giftedness differed in some domains need to be identified so teachers can describe level of giftedness, describe students' potential, and place students based on their giftedness domain (Hodge, 2013).

In Indonesia, rights of gifted children are regulated in the legislation number 20 Year 2003 article 5 paragraph 4 about Natioanl Education System said "*warga negara yang memiliki potensi kecerdasan dan bakat istimewa berhak memperoleh pendidikan khusus*". Citizen having intelligence potential and special talent have rights to get special education. There is also other statement that

stated in article 12 paragraph 1b "*setiap peserta didik pada setiap satuan pendidikan berhak mendapatkan pelayanan pendidikan sesuai dengan bakat, minat, dan kemampuannya*". Every student in every school has rights to get educational service based on their talent, interest, and ability. In line with those legislations, government provides educational services for gifted students through acceleration program. The essential part of this program is to give services for students with special talents and excellence intelligence to get faster in their education (Estiastuti, 2008). Besides, Widyastono (2002) also stated that acceleration program is a program giving educational services based on students' intelligence potential and special talents, by giving chance for them to be able to finish their regular program in shorter time than their peers.

Acceleration class in Indonesia is seen as giftedness class that mostly in science. The one of reason of selection stages for acceleration class is that student must have good mark for their science subjects (Hawadi, 2005). It makes acceleration class focuses on science subject and becomes science class. On the other side, Hawadi (2005) argues that gifted children in acceleration class have varied abilities and interests. It can be a reason that students in acceleration class have interests in other subject, beside science, as potential that needs to be built.

Interest in academic is one potential that needs suitable service. Schiefele (in Essien, 2015) states that interest is particular feeling on some conditions, things, or someone else. In line with the statement, Slameto (2010: 180) argues that interest is preference and bond on something or activity without any command to do. Essien (2015) also

states that interest is a person's long term form of objects, activities, or knowledge. Based on those statements, it can be concluded that academic interest is a kind of preference of one particular subject that can become academic potential. Thus, it is important to determine students' interest on particular academic subject so that they can get suitable service.

To measure specific academic interest, Rogers (2014) has *Rogers' Interest Inventory* (RII) questionnaire. The questionnaire can help teacher in deciding gifted students' academic interest. The questionnaire has seventeen items that can measure gifted students' interest level on specific subject. Result of this measurement can be categorized into three levels, namely very motivated, motivated, and lessmotivated. Based on the result of this questionnaire, teacher can recognize gifted students' another academic interest in acceleration class.

Based on the elaboration above, it is needed to do a research on academic interest of giftedstudents in acceleration class. This research tries to explore whether gifted students in acceleration class are students with science academic specific subject or have another academic interest that can be their main potential academic. Besides, the result of this

research can be reference in choosing suitable service for talent.

METHOD

This research used qualitative approach by analitic descriptive method. This research was held in acceleration class of SMA Negeri 3 Surakarta. The subjects of this research are fifthy-nine students. Datas was collected though Rogers' Interest Inventory (RII) of the three subjects such as science, social and art. The data collected were analyzed descriptively. Before described, the results of collecting datas was categorized into three categories according to the scoring system on Rogers' Interest Inventory (RII). If the average score of each instrument is 2.67 to 3.33, the subject was included in the category "motivated/interest" in these subjects.If the average score of each instrument is 3.34-4.9, the subject was included in the category "very motivated/very interest" in these subjects . Whereas, for score below 2.66 can be concluded that the subject have"less motivated/less interested".

Baseline descriptive statistics for average score of gifted students' specific academic interest are presented in Table 1

Tablel 1. average score of gifted students' specific academic preferences.

16	3,24	1,82	2,71	36	3,35	2,12	1,88	56	2,71	2,82	1,41
17	2,94	1,82	3,06	37	2,41	2,29	2,18	57	3,24	1,71	2,12
18	3,24	1,94	2,29	38	3,24	1,65	2,41	58	2,88	2,47	2,35
19	2,82	2,12	2,71	39	3,18	2,82	2,59	59	2,94	2,18	1,35
20	3,06	1,47	1,94	40	2,29	1,35	2,18				

Based on the assessment in Table 1, the data can be categorized in three categories in each academic interest. Gifted students included in "very motivated/ very interested" categoryon science subjects, social or art, if the value were 4. If gifted students' score are between 2,67-3,33, they were included in "motivated/interest" category, and "less motivated/less interest", if

the score is below 2,66. The result of categorization presented in Table 2.

Table 2. categorization of gifted students' specific academic preferences.

VM = very motivated; M = motivated; LM = less motivated

In order to clarify the results of the categorization of a gifted students' academic interests, presented the following chart:

Figure 1. chartof gifted students' academic preferences
Based on Figure 1, noted that the gifted students are more interest in science than social and art. Figure 1 also shows that gifted students have less motivated in social and art.

Beside Figure 1, researcher presented the result of gifted students' specific academic interests that has vary preferences inTable 3.

Table 3. gifted students' academic preferences

Sci-ence	So-cial	Art	Science and Social	Science and Art	Social and Art	Science, Social and Art	None of all
22	0	2	11	7	0	4	13

Based on Table 3, noted that twenty-four gifted students have one academic interest, eighteen gifted students have two academic interests, four students have three academic interests, and thirteen students have no interest in science, social, or art.

Discussion

Based on data analysis, it can be known that:
1. Science score in report card, that becomes one of students' identification requirements to be called gifted in acceleration class service program, cannot become one reference that all students in class have interest in science.
2. There is a student with good score in science but have more interest in art.
3. There is talented student with good score in science but do not have interest in science.

It shows that even 67.8% gifted students in acceleration class have interest in science; it cannot be guarantee that acceleration class should become science class because other students do not have interest in science. It happened because science's score of the students is one of requirements in acceleration class. It can produce new paradigm that acceleration class, which is actually for gifted students, becomes a special class for students with specific academic interest in science only.

In the other side, good score in science does not always become standard rule that students have interest in science. It can be seen from two students in acceleration class interested in art more that science. Talented students are students with IQ above average, namely 126/130 to 160 (Swiss Association for Gifted Children, 2010). The high IQ of gifted students can help them to study each subject well with good score even they do not have any interest for the subject. Interest is high preference about something (Djali, 2007). Interest is influenced by some factors, namely genetic and external factors, like family, school, community, and environment (Miflen and Miflen, 2003: 14).

Crow and Crow (in Dimyati, 2001: 56) continue that interest is influenced by psychology factor, social, and emotional.

Both statements do not include IQ as one of the factors. In the other word, high IQ of gifted students does not affect students' interest. It is also proved by result of this research that there are some students do not show any interest on sciences subjects. It is not because the students get bad scores in the subjects, but more because of their interest on the subjects.

Based on the explanation, it is important to recognize students' interest in academic. Interest can be standard measurement in identifying potential of a person (Latipah, 2009). Acceleration program focused on science could ignore another acceleration students' potential in academic. Thus, it needs building program of academic interest so the other potential of students can be built.

Building program here is a process or development with sequence of understanding, starting from establishing, needing, maintaining the development, accompanied by effort of improvement, process of completing, and developing it (Widjaja, 1998). Assistance in interest academic of students could be:

1. *Mentorship program.*

Mentorship program is placements program for gifted students by an expert or a professional, to learn deeper a particular interest that cannot be served in educational program (Rogers, 2014).

2. *Olympiad Class*

Olympiad class is given for gifted students in special academic to develop their potential. This class can be given after school time.

3. *Acceleration program of specific subject*

Gifted students' academic interest for a specific subject makes them having more desire to learn it more. They can join in acceleration program of special subject that gifted students can learn deeper about a subject and learn faster than the other students in same class.

4. *Talent seeking program*

This program works together with some universities by offering extension class every weekend for whole year to learn particular subjects. This program was implemented in 1974 in Baltimore, Maryland, and spread in other region like Illinois University of Arizona, and Duke University (Rogers, 2014).

5. *Long distance learning and independent learning*

Long distance learning or independent is choices for gifted students to develop their potential. This kind of learning works together with some universities that offers online education service, like Standford University's Educational Programs for Gifted Youth (EPGY). The university offers extensive course in mathematics and science (Rogers, 2014). Beside, independent learning is another way of learning that uses internet as learning media and it can be conducted at home or school.

CONCLUSION

Based on discussion, it conclude that (1) science score in report card, that becomes one of students' identification requirements to be called gifted in acceleration class service program, cannot become one reference that all students in class have interest in science, (2) there are students with good score in science but have more interest in art, (3) there aregifted students with good score in science but do not have interest in science and (4) gifted students' interest could be a potential that must be developed through appropriate service, such as mentorship program, olympiad class, acceleration specific subject class, talent seeking program, and long distance learning and independent learning.

IMPLEMENTATION OF ARCS LEARNING MODEL IN LEARNING BASIC CONCEPT ANALYSIS OF SOCIAL SCIENCE AT THE ELEMENTARY SCHOOL

Murtiningsih

Faculty of Education, State University of Malang

email: murtiningsih.ksdp@yahoo.com

ABSTRACT

There are various learning models of social science at the Elementary School, but it is important for teachers to select the appropriate and suitable learning model that conforms to presentation material of a subject. One of effective learning model for basic concept analysis learning of social science at the Elementary School, which could develop activities and creative thinking of the students, is ARCS learning model. ARCS is abbreviation of A (Attention), R (Relevance), C (Confidence), S (Satisfaction). Such learning model will assist the students to comprehend reading materials and to activate them through subject materials, which have been learnt. Besides that, it may create positive response and create better relationship with others, as well as raise self-confidence, responsibility, and enjoyable. Teaching Social Science by applying ARCS learning model will give opportunity to the students that give priority to the student's attention, adjust learning material with learning experience of the students, and create self-confidence and self-satisfaction.

Keywords: cooperative learning model of ARCS, basic concept analysis on social science, Elementary School.

Teaching is the main duty of a teacher; therefore its effectiveness depends on teacher in doing good teaching activities. Factors that affect teacher in teaching activities include the teachers themselves and the way of teaching they choose and apply, however, good teachers should recognize various ways of teaching and they should be able to choose the appropriate one that conforms to their abilities and environmental conditions. Various learning models have been known in teaching world even though none of them is the most appropriate for all situational and conditional objectives. Model refers to conceptual frame used as guidance in doing an activity. Learning model refers to conceptual frame, which describes systematic procedures in organizing learning experiences to achieve a specific objective of learning and function as guidance for the learning designers and teachers in designing and implementing the activities of learning and teaching (Udin Syarifudin, 1994:73). Essences of learning are activities done by teachers, which encourage the students to have good behaviors. Learning is effort of teacher to create climates and services toward diverse ability, potency, interest, talent, and necessity of the students in order to establish optimal interaction between teacher and student, as well as among students (Suyitno .A., 2004: 2). Specifically for Social Science learning, such learning model refers to objective of the social science learning itself. According to NCSS (National Council for Social Studies), objective of social science learning are to assist the next generation to : (1) develop his/her ability to be knowledgeable individual; (2) develop intelligence in making the decision for the public goodness as citizens who live in culture, and (3) to be democratic society in mutual-dependence (Rochmadi, 2008:9).

Furthermore, in accordance with Curriculum of Educational Unit, objective of social science subject is intended for the students in order to have abilities to: (1) recognize concepts that relate to the public and environment; (2) possess basic ability to think logically and critically, curiosity, inquiry, problem solving, and skills in social life; (3) have commitment and awareness toward social values and humanity; (4) have ability to communicate, cooperate, and compete in a plural society, at local level, national, and global (Department of National Education, 2006:40).

Scope of Social Science reviews a set of events, facts, concepts, and generalization that relate to social issues. According to the Board of National Standard Education (BSNP, 2006:575), the scopes of Social Science subject at Elementary School include aspects as follow: a. human and environment, b. time, continuation, and change, c. socio-cultural system, and d. economic behavior and welfare. Through Social Science subject, the students are directed to become democratic and responsible citizens, as well as become the world citizens who love peace. Therefore, Social Science subject is designed to develop knowledge, understanding, and analytic ability toward social condition in entering dynamic social life.

In curriculum of Social Science for Elementary School in 2006, the review included: 1. Items that relate to social knowledge including review about family, local society, money, kinds of

job, economic activities, cooperation, production, communication, transportation, social problem, local environment maps (Municipality/Regency, Province), natural views, natural resources, diversity of tribes and local culture, natural disasters in Indonesia and other countries in the neighborhood, development of administrative system in all regions in Indonesia, neighboring countries, roles of Indonesia in globalization era, export-import in Indonesia as activities among countries. 2. Elements that relate to history, including review about local history, follow the heroism and patriotism examples of important figures in the related environment, histories of Hinduism, Buddhism, and Islam in Indonesia, struggle of the warriors during colonialism of Dutch and Japanese, roles of important figures in preparing the Indonesian Independence, roles of the great figures in proclaiming the Indonesian independence, and struggle of the great figures in defending the Indonesian independence.

DISCUSSION
Basic Concept of CLM

Conceptually, ARCS learning model is a technique of cooperative learning model. According to Slavin (1995:4), cooperative learning method is a technique of learning, in which the students learn and cooperate collaboratively in small groups that comprise of 3-6 students in each group and the group has heterogeneous structure. Cooperative learning method is a collaborative form in small group, in which the students work together to complete the given assignments (Tinzman, et al. in Adnyana, 2004). Furthermore, David, 1990; Kagan, 1992 (in Jacob, 1999) set a limitation on cooperative learning that refers to group learning method, which comprises of small groups (5-6 students), in which the students cooperate and help to each others in completing academic assignments. Cooperative learning method is strategies that support small groups/pairs of student to cooperate and interact to develop knowledge and finish the assignments (Teo, 2003:108).

Based on the opinions above, cooperative learning method emphasizes on cooperation and sharing ideas in small groups that have heterogeneous characteristics. Such heterogeneous characteristics have made the cooperative learning method to provide opportunities for the students who have different backgrounds to encourage mutual assistance and mutual respect.

In relation to learning the Social Science, cooperative learning method can be applied to encourage the students in expressing their opinions, increasing self-confidence and responsibility. In learning the social science, the students frequently face materials that relate to facts, concepts, generalization that requires description, analysis, as well as demonstration. Therefore, such cooperative learning method is the most appropriate method that can be applied because the students will get involved and try to get self-involvement actively in learning process. This condition will bring about positive impact on quality of interaction and communication, which finally increase learning achievement of the students.

Characteristics of cooperative learning method include: (1) each member plays his/her own role, (2) interaction between students, (3) each member of the group is responsible for his/her study and his/her friends in the related group, (4) teacher encourages the students to develop interpersonal skills of the group, and (5) teacher just interacts and gets involved if required (Karin, 1993).

Cooperative learning is a system, which consists of close-related elements. The elements include: (1) positive mutual-dependence, (2) face-to-face interaction, (3) individual accountability, (4) skills to make inter-personal/social relationships, which are taught intentionally, (5) group process (Johson & Johson et al., 1998:100).

Steps in cooperative learning. There are variations of cooperative learning steps that conform to the developed cooperative learning (Arends, 2004:374) suggested 6 steps in cooperative learning started from the teachers who transfer the objective of learning, motivate the students to study and present other information in common way through lecturing (verbal), however, those 6 steps of cooperative learning methods is presented in table 1.

Definition of ARCS Learning Model

According to Suprijono (2009:166), ARCS learning model is learning model, which give priority to motivational condition management of the students during the learning. The conditions include Attention, Relevance, Confidence, and Satisfaction. Of course, such motivational condition management will affect the students in learning activities. The stronger motivation of the students will affect their interest and willingness to learn.

The application of ARCS learning model in class should describe 4 components, such as Attention, Relevance, Confidence, and Satisfaction, which are intended to motivate and keep motivation in learning-teaching activities.

Table 1 on steps of cooperative learning model

Phase	Teacher Behavior
Transfer the objective and prepare learning equipments	Teachers transfer all objectives of learning and prepare the learning equipment.
Present information	Teachers present information by demonstration/text.
Organize students in the form of study groups	Teachers demonstrate to the students how to establish group and assist each group to have transition efficiently.
Assist the group's work during study	Teachers assist the study teams during they do the assignments.
Perform evaluation	Teachers evaluate the result of learning about materials that have been learnt or each group may present the learning result.
Give reward	Teachers search ways to appreciate, both efforts and learning result of individual and group. s

Components of ARCS Learning Model

According to Alam (2011), ARCS learning comprises of 4 components as follow:

Attention. Attention means concentrating and focusing brain ability or focusing the students' thought on something in activities of learning and teaching process in the classroom. Attention plays important role in learning activity. Attention may be developed from inside of the students if they are motivated to learn something.

According to Suprijono, "attention of the students emerges due to curiosity. Therefore, curiosity should get stimulus so that the students will pay attention or the attention will be sustained during learning-teaching process even a little longer. Such curiosity can be stimulated through new elements, weird, different from the existed ones, contradictive or complex" (2009:166).

Therefore, in teaching activity, teacher should encourage the student's attention on subject, which is taught. Strategies to encourage attention include: (a) applying varied learning methods (lecturing, discussion, playing roles, simulation, expressing ideas, demonstration, exploration, case study, etc). (b) Using learning medium to complete the presentation of review materials (transparency, video, slide, film, tape, etc.). (c) Using humor in learning process. (d) Using factual proof to clarify the implanted

concept. (e) Using ask a question technique to involve the students actively (Alam, 2011).

Its application in learning can be done as follow: (a) Ask the students to pay attention and minimize any disturbance. (b) Use signal or guideline for something important. (c) Use instructional comment, such as "well, let's discuss about…", "now, pay attention". (d) Make the learning becomes interesting. The surfeit frequently emerges if the learning seems monotonous. (e) Use medium and technology effectively as part of learning in the classroom. (f) Focus on active learning to create enjoyable learning process. (g) Do not give too much information because it will make the students to be bored (Suparno, 2009:167-169).

Teacher should pay much attention on this component by performing the learning activities or creating learning activities in order to keep the students to pay their attention on learning or concentrate on learning activities.

Relevance. According to Suprijono "Such relevant condition relates to correlation between learning materials and necessity and condition of the students. Motivation of the students will be well-maintained if they consider that, what they have learnt, it has met and beneficial for the student's need" (2009:169). Correlation or conformity of these materials will motivate the students to learn. It will encourage them to be more active in following the learning process. Students will perceive the correlation between materials, which they have learnt, and their own experiences.

Strategies that can be implemented in learning activities are as follow: (a) Tell the students about what they get and do after learning the subject. (b) Describe benefits of knowledge, skills or attitudes, as well as values that will be learnt and how those things will be beneficial in the future. (c) Give examples, practices, or tests, which directly relate to condition of the students (Alam, 2011).

Teacher should pay more attention on this component by encouraging the learning activity, so that the students will perceive that materials, which have been learnt, have conformed to their experiences and it will be useful for themselves in the future.

Confidence. According to Suprijono, self-confidence is "… personal belief that he/she has ability to complete an assignment as prerequisite of success" (Suprijono, 2009:170). Duties of the teacher are to increase and motivate self-confidence of the teachers.

Strategies that can be implemented to increase self-confidence of the students and their environments, such as: (a) increase the students' expectation to be success by improving experiences of success. (b) Arrange the learning into more

specific parts, so that they will not be insisted to learn more new concepts. (c) Increase the students' expectation to be success by suggesting requirements to reach success. (d) Increase the students' expectation to be success by using control strategy, due the success depends on them. (e) Develop self-confidence of the students by suggesting, "It seems that you have comprehended the concept, which I taught", and then stated the weakness as "something that must be improved". (f) Provide instructive feedback during the learning process (Alam, 2011).

In relation to this learning, teachers endeavor to offer activities, which encourage self-confidence of the students, for example reinforce them and provide feedbacks.

Satisfaction. Learning achievement will create self-satisfaction among the students (Suprijono, 2009:171). Teachers may implement strategies to increase learning satisfaction, such as: (a) praising the students verbally and providing informative feedback. (b) Providing opportunity to the students to use or implement new knowledge, which they have learnt. (c) Ask the students to master certain skills or knowledge to assist their friends who have not succeeded yet. (d) Compare the student's achievement and self-achievement in the past or specific standard, but not to compare them with other students (Suprijono, 2009:171).

In relation to this learning, teachers endeavor to offer activities, which give opportunities to the students to solve the problems by their knowledge in order to encourage the students to master it.

Steps of ARCS Model. Steps used in ARCS learning model as suggested by Learningtheori (2010) are as follow:

a. Remind the students on concept that has been learnt (A)

In this first step, teacher tries to attract the students' attention by repeating the subject, which has been learnt by the students, and relating it to the subject that will be taught. Therefore, the students will be attracted and motivated toward the subject, which will be presented.

b. Describing objectives and benefits of learning, transferring materials of the subject, and guiding the study (R)

In this step, teacher describes objectives and benefits of learning, which will be taught. In relation to this activity, teacher uses various ways but still refers to principle of diversity among students, so that all students may catch the objectives and benefits of learning, which have been given, as well as recognize the relationship or correlation between materials of

the subject that have been given and learning experiences of the students.

In transferring materials of the subject, teacher should transfer it clearly and accurately. Such material transferring should be done by strategies that could motivate the students. For example, teacher may present attractive materials of subject that could attract the students' attention, show correlation between materials of the subject and experiences of the students or relate to their daily life, increase self-confidence of the students by giving opportunity to ask questions, give response, do the tasks or assignments, and create self-satisfaction of the students by offering reward for their achievements.

In guiding the study, teacher should motivate and guide the students to comprehend the given materials easily. Objective of this activity is to increase self-confidence of the students, so that they would not be doubtful in giving responses or in completing the tasks. Besides that, it will be useful for students who have difficulty in comprehending the given learning materials.

c. Give opportunity to students to participate in learning (C)

In this step, teacher gives opportunity to the students to ask question, respond, and complete the assignments about the given learning materials. By giving opportunity to the students to participate, students will compete healthily and actively in following the learning process.

Giving opportunity to students to participate in this learning will encourage and increase self-confidence of the students, and finally, it will create self-satisfaction of the students because they have already involved in learning process. Therefore, the important thing in learning is involving the students directly and actively in learning.

d. Provide feedback and conclude each material that has been given at the end of learning (S)

Teacher provides feedback, which of course, stimulate thinking pattern of the students. Providing such feedback will increase self-confidence and self-satisfaction of the students. It is expected that the application of feedback in the form of reinforcement will attract the students' attention, so that they will focus on the learning subject. Besides that, the students' attention will automatically focus on materials of the subject in accordance with they need in order to be applied in daily life.

In concluding materials of the subject, teacher should conclude the materials clearly and accurately. It can be done by various ways, such as give opportunity to the students to draw conclusions about materials, which they have learnt by using their own words, so that it will indirectly create self-satisfaction of the students.

Advantages and Disadvantages of ARCS Learning Model

According to Awoniyi, et al. (1997:30) this ARCS learning model has some advantages, such as: (1) providing active direction and guidance about what must be done by the students. (2) How to present the materials using ARCS model, it is not just theories with less attractive application. (3) The motivational model, which is reinforced by student-centered learning design. (4) Application of ARCS model may increase motivation to repeat other materials, which were considered less attractive. (5) Evaluation as a whole toward abilities, which are more than characteristics of the students in order to make the learning strategy becomes more effective.

However, as described by Awoniyi, et al. (1997:31), the disadvantages include: (1) Affective results of the students are difficult to be evaluated quantitatively. (2) Continual development through ARCS model is difficult to be used as base of evaluation (Learningtheori, 2010).

Implementation of ARCS Learning Model

Implementation of ARCS learning model is one of meaningful learning applications in basic concept analysis on Social Science at the Elementary School. Through the application of this ARCS learning model, students will get involved in complex ways, such physically, emotionally, and intellectually. Application of ARCS learning model is appropriate to be applied at higher classes/grades, such as 4, 5, and 6 grades.

Example: the application of ARCS learning model at the Fourth grade, by Competence Standard: 2. Recognizing Natural Resources, economic activities, technological progress at regency/municipality, and province. Basic Competence 2.1 describes economic activities, which relate to natural resources and other potencies at the related region. In which, the indicators include: (1) identify types of natural resources and other potencies at the related region, (2) describe benefits of natural resources and other potencies at the related region, (3) recognize economic activities that relate to natural resources and other potencies at the related region, (4) describe the need to preserve natural resource and other potencies at the related region.

The steps are as follow: *a. Remind the students on concept that has been learnt (Attention).* Teacher tries to focus the students' attention by repeating the previous materials, using attractive medium, asking questions that relate to materials, which have been taught. *b.*

Describe the objectives and benefits of learning (Relevance). Teacher describes objectives and benefits of learning, which relate to the subject material of natural appearances and the influence of socio-culture. Teacher relates the learning, which will be learnt, and factual examples in daily life of the students. *c. Transfer materials of the subject (Relevance).* Teacher transfers the learning materials by using small group discussion method. The students make a group to complete the Assignment Sheets, and each group consists of 4-5 students. *d. Guide the study (Relevance).* Students discuss to do the activities in accordance with Assignment Sheets and teacher should give guidance during the group discussion. *e. Give opportunity to the students to participate in learning activity (Confidence).* The students will report results of their discussion before the class and their friends respond them, ask questions or give suggestions. *f. Provide feedback (Satisfaction).* Students pay attention on the teacher's explanation about materials that have been taught and teacher should provide feedback. Students will solve the problem in relation to materials that have been taught. The problem was given spontaneously during the learning process. *g. Conclude each material that has been presented at the end of learning activity (Satisfaction).* Students will present the conclusion of materials that have been taught. Teacher reemphasizes the materials that have been taught.

Objectives of ARCS learning model are to manage motivational conditions of the students, such as attention, relevance, confidence, and satisfaction, which are intended to motivate and maintain the motivation to follow learning activities. In this learning, teacher should be wise, prudent, and capable in creating conducive, comfortable, and enjoyable atmosphere in class.

CONCUSION

ARCS learning model is learning model, which give priority to the students' attention, adjust learning materials to learning experience of the students, increase self-confidence of the students, and encourage self-satisfaction of the students. Such learning covers effective and enjoyable study that may affect success of the students and bring benefits for the students' life. The students are strongly motivated in influencing their interests and willingness to study. Therefore, the teachers would be motivated to encourage the students' spirit by creating enjoyable learning activities in order to comprehend concepts that have been learnt by the students.

ARCS learning activities do not only offer materials that must be learnt by the students. Furthermore, the students are taught how to create good emotional relationship during study.

DISCOVERY-INQUIRY LEARNING APPROACH STUDY ON THE IMPLEMENTATION OF THE NATIONAL CURRICULUM ON LEARNING ACTIVITIES

Nandang Hidayat; Husnul Khotimah

Lembaga: ………

E-mail: mr.nandang@yahoo.com

ABSTRACT

National Curriculum which is the development of the curriculum in 2013 more process-oriented, ie the process of learning is thematic, contextual, and integrative, which emphasizes the cultivation of character and values (values) with a scientific approach (scientific). The learning process should be based on the principle: a student-centered, interactive, make the most of the environment danjejaring, students actively conduct the inquiry process (discovery-inquiry), removed from the real world, based on the team (team teaching), meaningful learning (the rules of association), observations (observation) using all the senses, cooperative learning, using multimedia, based on the needs, interests and potential students, facilitates diversity of individual initiative, students are given the confidence, responsibility and autonomy in learning, and develop critical thinking skills and creativity of the students. The National Curriculum requires teachers to be able to carry out learning activities that can facilitate the development of student competence includes attitudes, skills and knowledge in a balanced manner. One model of learning that are relevant to the characteristics of the national curriculum is learning to pendekatandiscovery-inquiry. This learning is suspected can improve students' understanding of learning content (product of science), while developing the skills and scientific attitude. Discovery-inquiry approach, consists of five main steps, namely: engage, explore, explain, elaborate, and Evaluate. The National Curriculum requires teachers to be able to carry out learning activities that can facilitate the development of student competence includes attitudes, skills and knowledge in a balanced manner. One model of learning that are relevant to the characteristics of the national curriculum is learning to pendekatandiscovery-inquiry. ***Keywords:** scientific, discovery-inquiry, the product of science, scientific process skills, and scientific attitudes.*

The era of globalization is the information age. The era of globalization is characterized by rapid change and unpredictability as well as opening up opportunities to the level of competition between individuals. Changes that occur and opening up opportunities to compete are the opportunities and challenges for individuals who are competitive and full of initiative, but it would be disastrous for those who do not have the required competence.

In order to prepare the sons and daughters of the Indonesian nation entered the era of globalization, education plays a very strategic. Through the practice of proper education, we can equip and develop competencies dipersayaratkan to children (read: students) to be able to compete and we can live well in the era of global competition. One of the efforts that have been and continue to be the

government is making changes to the curriculum tailored to the demands of Characteristics and scientific developments as well as changes in the era of human life. National curriculum which is a translation of the curriculum in 2013, has different characteristics to the previous curriculum. National Curriculum more process-oriented, ie the process of learning is thematic, contextual, and integrative,

Each curriculum with individual characteristics, attitudes and behavior requires a different teacher when conducting learning and learners when learning. However, in reality the curriculum changes do not necessarily change attitudes and perlaku teachers in performing their duties. Many teachers are not concerned with changes in the curriculum and the changes taking place in society. They tend to retain the learning model that is routinely performed. This can be observed from the behavior of teachers when

implementing the learning activities. There are at least six things that show a discrepancy between the learning process is carried out with the demands of teachers in the school curriculum and the global community, namely: 1) Teachers still tend to organize the learning process is general and theoretical, while the global society each individual is required to be able to solve problems that are specific only be obtained through observation and direct involvement in specific activities. 2) Education requires teachers so that each participant didikmencapaimastery matery without pempertimbangkan individual differences of learners. While each individual in the community do not have to master the mastery in all areas, but more are required to share the duties and responsibilities (jobs and responsibility sharing) accordance their respective fields. 3) The learning process is less demanding learners to use the tools of thought (tool-lessthought) which emphasizes on the quality of the learning process through a scientific approach, but more emphasis on the content (content) lessons to be learned learners. While in the community is required to use the tools of cognitive (cognitive tools) optimally. 4) The learning process is more directed at the development of symbolic thinking (symbolic thinking), while people are required to engage directly (direct Involved). 5) The majority of teachers still seated learners as passive recipients of information and teachers act as the sole source of information. While communities in the global era requires the ability to search, select and sort information (information searching). 6) Evaluation study science is focused on science products, while in the development of science and technology in society requires the mastery of science process skills and scientific attitude. 4) The learning process is more directed at the development of symbolic thinking (symbolic thinking), while people are required to engage directly (direct Involved). 5) The majority of teachers still seated learners as passive recipients of information and teachers act as the sole source of information. While communities in the global era requires the ability to search, select and sort information (information searching). 6) Evaluation study science is focused on science products, while in the development of science and technology in society requires the mastery of science process skills and scientific attitude. 4) The learning process is more directed at the development of symbolic thinking (symbolic thinking), while people are required to engage directly (direct Involved). 5) The majority of teachers still seated learners as passive

recipients of information and teachers act as the sole source of information. While communities in the global era requires the ability to search, select and sort information (information searching). 6) Evaluation study science is focused on science products, while in the development of science and technology in society requires the mastery of science process skills and scientific attitude. 5) The majority of teachers still seated learners as passive recipients of information and teachers act as the sole source of information. While communities in the global era requires the ability to search, select and sort information (information searching). 6) Evaluation study science is focused on science products, while in the development of science and technology in society requires the mastery of science process skills and scientific attitude. 5) The majority of teachers still seated learners as passive recipients of information and teachers act as the sole source of information. While communities in the global era requires the ability to search, select and sort information (information searching). 6) Evaluation study science is focused on science products, while in the development of science and technology in society requires the mastery of science process skills and scientific attitude.

If the process of education that takes place in schools can not adapt to the changing demands of the curriculum and the needs in the community, at the end of the school / education would not be able to deliver the participants didiknnya to be able to live in society but on the contrary will cause them alienated from society. Therefore, the process of education must make changes continuously to be able to adjust to the demands that arise in the life of society. One effort that can be done is to change the orientation of the learning objectives that originally oriented content (content) into berientasi the achievement of competence through thematic learning process, contextual, and integrative scientific approach in accordance with the demands of the curriculum in 2013.

DISCUSSION
Characteristics of the National Curriculum
National Curriculum as the elaboration of curriculum in 2013 has the particularity that is different from the previous curriculum, the CBC in 2004 and SBC in 2006. The differences are presented in the Training Materials Curriculum 2013, the Ministry of Education and Culture, in 2013, including:

In the CBC in 2004 and SBC in 2006, derived from the Graduate Competency Standards Content Standards, whereas in 2013 the curriculum Graduate Competency Standards derived from necessity;

In the CBC in 2004 and SBC in 2006, the Content Standards formulated based Course

Objectives (Competency Standards Graduates subjects) are broken down into Competence Standard and Basic Competence Subject, while the curriculum in 2013, the Content Standards derived from Graduates Competency Standards through core competencies are free subjects.

In the CBC in 2004 and SBC in 2006, there is a separation between subjects forming attitudes, forming skills, and forming knowledge, whereas in 2013 the curriculum, all subjects should contribute to the formation of attitudes, skills and knowledge.

In the CBC in 2004 and SBC in 2006, competencies derived from the subject, while in the 2013 curriculum, subjects derived from the competency.

In the CBC in 2004 and SBC in 2006, subjects separated from one another, such as a collection of separate subjects, while in 2013 all curriculum subjects bound by core competencies (per class).

There are seven characteristics of the curriculum in 2013 that must be understood by the teacher as curriculum implementers in the front row in the overall educational process. Depth understanding of the characteristics of the curriculum in 2013 with a strong commitment of teachers to implement it will greatly influence the attitudes and behavior in implementing the learning activities. To that end, an obligation for us as teachers to seek to understand the national curriculum and maintain a commitment to carry out the task as well as possible. Seven characteristics of the national curriculum as set forth in Attachment Regulation of the Minister of Education and Culture Number 67 Year 2013 About the Basic Framework and Curriculum Structure of Primary Schools / Islamic elementary schools, are: 1) to develop a balance between spiritual attitudes and social development, curiosity, creativity, cooperation with intellectual and psychomotor abilities; 2) The school is part of a community that provides a planned learning experience where learners apply what is learned in school into the community and take advantage of the community as a learning resource; 3) develop the attitudes, knowledge, and skills and apply them in various situations in schools and communities; 4) provide sufficient time freely to develop the attitudes, knowledge, and skills; 5) competence is expressed in the form of class core competencies specified further in basic competencies lesson; 6) class core competence becomes an element of organizing (organizing elements) basic competence, where all the basic competencies and learning processes developed to achieve competence stated in core

competencies; 7) kompetensidasar developed based on the principle of cumulative, mutually reinforcing (reinforced) and enrichment (enriched) antarmatapelajaran and education level (horizontal and vertical organizations).

Based on these characteristics, if are associated with learning activities that must be carried out by teachers leads to the conclusion that the national curriculum learning requires a paradigm shift towards diversity or differences in accordance with the demands of the needs and potential of learners, learning outcomes rather than uniformity. Teachers are required to continue to develop the abilities that are expected to carry out the learning process in accordance with the quality and characteristics of the national curriculum. In this case, learning activities should be based on the following principles: 1) Student-Centered (student center) is not centered on the teacher (teacher center) like the case today. Siswalah should actively learn while teachers act as facilitators of student learning. 2) Learning should be interactive and not one-way. Students are given the widest opportunity to interact with teachers and fellow students as well as with a variety of learning resources. Through interactive learning process allows the exchange of knowledge between teachers and students and between students and other students. 3) Utilize as many danjejaring environment as a learning resource that can help students achieve competency cognitive, affective, and psychomotor skills in a balanced manner. Students are exposed to a learning environment that is free. 4) Learning should facilitate students to actively conduct the inquiry process (discovery-inquiry) through a scientific approach. The active involvement of students in the process of investigation to help students find the concept and his own knowledge. 5) teaching materials should be removed from the context of the real world. Teachers are required to be able to identify the components of real-life identical to the contents of teaching materials and integrated in the learning process. The purpose of learning emphasis on creating an understanding, which demands creative-productive activities in the real-world context. 6) Teaching is not carried out by the teacher indidual, but the study conducted on the team (team teaching). Two or three teachers (same or allied subjects or different) implement learning activities with a particular theme at the same time. This allows for learning with a multidisciplinary approach that can take students on the understanding that knowledge does not stand alone but related to one another. 7) Applying the principle of learning bermaknadengan linking between concepts are studied and the concept or prior knowledge of students (rules of engagement). Learning is the meaning of knowledge and learning

is the process of digging meaning. Brain (mind) serves as a tool to interpret the meanings that appear unique. 8) Five senses is the receiver of information. Through the process of learning, teachers must help students develop sensitivity senses. For that, the learning process must involve a process of observation (observation) to use all the senses to stimulate the development of students' sensory sensitivity. 9) Utilizing a variety of instructional media and educational technology equipment (multimedia) to help facilitate the understanding of, and interest and enthusiasm siswadalam learning. 10) Students are facilitated to develop collaboration capabilities through a cooperative learning experience, not the individual learning experience and competitive. Learning per se has a social aspect, and group work is invaluable. Some research indicates that cooperative learning has a significant influence on the development of children's social skills and intellectual rather than individual learning environment and competitive. 11) Human beings are unique. Every individual has an interest, talent, and other potential different. The task of the teacher is to explore and facilitate the potential of the students can stand optimally developing States. In this case, the learning must be tailored to the needs, interests and potential students. 12) Learning should be memfailitassi diversity initiative of individual students. Provide choice tasks. Provide a choice how to show success. Provide enough time thinking and writing tasks. Do not use too many tests that have been timed. Provide an opportunity to think again. Involve concrete experience. 13) Students are given the confidence, responsibility and autonomy in learning. Control of learning held by students, while teachers provide guidance and direction. Trust and responsibility are essential elements in a learning environment that could determine the success of student learning. 14) Develop critical thinking skills and creativity of the students. For that, the learning process should mendorongmunculnya: discussion on the knowledge learned, divergent thinking, various types of overflow of thoughts / activities, critical thinking skills,

Why Should Approach Discovery-Inquiry?

Knowledge and technology continues to evolve dynamically. The development of science and technology is the result of a survey of human activity that is driven by curiosity and the efforts to solve the problems facing humanity. Activities for gaining knowledge and technology is done through a systematic process called the scientific method is based on the

scientific attitude. Therefore, the development of knowledge and technology that occur with the progression of the scientific method and scientific attitude. Thus, the development of science and technology essentially involves three aspects, namely: 1) the scientific attitude: Beliefs, values, opinions, and other affective aspects inherent in individual self actualization is shown by the way in thinking, acting, and acting. For example: curiosity (curiousity), humble (humality), skeptical (Skepticism), objectively, do not hastily conclude unsupported by sufficient data to solve problems, and so on. 2) process or the scientific method: The investigation process is done to solve the problem. For example formulating hypotheses, designing and conducting experiments, conduct surveys, evaluate the data, measure and so forth. 3) Scientific Products: Fact-fata, principles, laws, theories, and so on as the conclusion of a series of results of scientific processes. measure and so forth. 3) Scientific Products: Fact-fata, principles, laws, theories, and so on as the conclusion of a series of results of scientific processes. measure and so forth. 3) Scientific Products: Fact-fata, principles, laws, theories, and so on as the conclusion of a series of results of scientific processes.

Scientists studying the phenomenon and seek solutions to the problems faced by a series of activities the assessment of facts / theories and formulate hypotheses (rational assessment), conduct experiments and / or surveys, observations, as well as data processing and analysis (study emprik). The series of events is a process of inquiry to discover new knowledge. In carrying out the process of inquiry, they cling to the values of the so-called scientific attitude. They also do a wide variety of experiments and statistical procedures in an attempt to clarify the mysteries into his study. Through these activities they managed to make discoveries (discovery), in the form of knowledge called scientific products.

Science develops through a process called the scientific method is rational and empirical. The scientific method is systematic, namely: 1) preceded by the problem, 2) conduct a study of facts and theories, 3), proposed a hypothesis, 4) making observations through trial, 5) analyze data on the pengamtan, and 6) to draw conclusions. In education, the stages of the process or the scientific method is then used as the approach in the learning process. One approach to science learning based on the scientific process is the discovery and inquiry approach.

Discovery Approaches and Inquiry

*Discovery*and inquiry is one approach to learning. This approach is recommended with the premise that every child (student) basically had the curiosity (curiousity) high. Education should be

able to maintain and develop children's curiosity through a learning process that can provide a unique and interesting experience and be able to actualize the children's curiosity.

Is the discovery and inquiry? Carin and Sund (1975: 97) defines that "discovery Occurs when an individual is mainly Involved in using his mental processes to mediate or (discover) some concept or principle." On the other, Carin and Sund mentioned that discovery involves processes mental to assimilate concepts or principles such as: observing (observing), classification (classifying), gauge (measuring), predicted (predicting), explain (describing), and guess / estimate (inferring). Funk et al. (1979: 3-65) a sixth grouping process skills such as basic process skills. In prosesinquiry, children perform higher mental activities as proposed by Curin and Sund (1975: 98), that "... the individual tends to act more like a muturing adult." Funk et al. (1979:

Scientific inquiry (inquiry) in a broad sense can be defined as an attempt to look for the truth or knowledge (knowledge). Activities in scientific inquiry includes identifying and formulating the problem, formulating hypotheses or answer while rational for the problem, and design and conduct investigations / research to test the hypothesis. The key to scientific inquiry is the submission problems or questions meaning or value (a significant) of an object or phenomenon. The questions arise because of the curiosity which then encourages the process of scientific inquiry to find answers rationally and empirically tested. Mastery of basic science process skills are a prerequisite to master the integrated science process skills.

Environment presents a very interesting phenomenon, and full of mystery. Through learning activities with discovery-inquiry approach, the child will feel challenged to interact with nature and the environment surrounding the test beliefs and ideas with the discovery of new evidence. This of course will foster scientific attitudes in children.

Discovery- inquiry approach will give birth to at least four advantages for students, namely: 1) the development of intellectual potential of children, 2) the emergence of a stronger intrinsic motivation rather than extrinsic, 3) heuristic learning through discovery, 4) concepts and principles learned longer remembered.

Being a scientist means to embody the attitudes and behavior in approaching and seeking answers to a number of problems that meets their minds. Relation to the activities of science lessons in schools, in order to realize the students who have the academic

competence, namely academic skills such as the skill to inquire scientifically in solving various problems, then the orientation of the learning process of science should not only be directed at the mastery of the product or content (content) of science but must be directed on pegembangan science process skills.

Table 1. Science Process Skills

Science Process Skills	
Basic	integrated
▪ Observe ▪ classifying ▪ Communicating ▪ Mangukur ▪ predicting ▪ Summing (inference)	▪ identifying variables ▪ Constructing a table of the data ▪ constructing charts ▪ Explaining the relationship between variables ▪ Collect and process data ▪ analyzing investigation ▪ formulate hypotheses ▪ Operationally defining variables ▪ designing investigation ▪ conduct experiments

Science learning approach that is directed at the development of skills in general scientific process called the scientific approach (scientific approach). There are many benefits students through the learning process approach, science include: 1) increasing the intellectual potential of students; 2) generate more intrinsic than extrinsic motivation; 3) develop self-concept on students; 4) the concepts studied longer stored in the memory; 5) improve social and emotional intelligence; 6) gives a broader opportunity for students to assimilate and accommodate the information in the learning process; 7) into a student-centered learning (student centered).

One's intellectual potential will only develop if he often uses his brain to think. Through science process skills approach, students are encouraged to perform high mental activity and trying to find (discovery) concepts taught himself. As a consequence of the success of the students find their own concepts learned cause vibration intellectual (intellectual thrill) and vibration emotions (emotional thrill) in him. This is a tribute intrinsic or self-satisfaction that is priceless to him. Teachers often try to provide extrinsic rewards but often not succeeded in arousing interest in student learning because students do not enjoy learning atmosphere that it faces. If we want to make students enjoy learning fun it must be planned a learning system that can offer intrinsic satisfaction for the students. It should be emphasized that only through learning science process skills, students have the opportunity to conduct discovery and

solve the problems that it faces. Through the process of skills development, students are slowly learning how to organize and conduct an investigation so that in time will form prowess conduct scientific inquiry. With the skills of scientific inquiry that has been held, the students will enjoy learning she lived. students have the opportunity to conduct discovery and solve the problems that it faces. Through the process of skills development, students are slowly learning how to organize and conduct an investigation so that in time will form prowess conduct scientific inquiry. With the skills of scientific inquiry that has been held, the students will enjoy learning she lived. students have the opportunity to conduct discovery and solve the problems that it faces. Through the process of skills development, students are slowly learning how to organize and conduct an investigation so that in time will form prowess conduct scientific inquiry. With the skills of scientific inquiry that has been held, the students will enjoy learning she lived.

Learning activities with science process skills approach encourages the involvement of students' mental intensely so in addition to developing their science process skills, also learned the concept can be understood in more depth and relatively longer stored in its memory. This happens because the students do not learn by simply listening to the information submitted teacher but he saw and engage directly perform activities of scientific process.

Watson in Carin (1975: 101) argues that the basic principles of learning psychology is the greater involvement of students in learning activities, the higher the learning abilities. Many teachers think that when students learn, they do asimilisasi on some of the information it conveys so lead to better teaching and learning that is more centered on the teacher (teacher centered). This view is too narrow, because it involves various aspects of learning in total which contribute to the formation of an individual's personal intact. For example in learning through skills development process, students not only learn about the concepts and principles but also learn to understand themselves, responsibility, social communication, emotional control, and so forth. All of which are essential values that must be developed in students that can only happen if a student-centered learning (student centered) as the learning process skills approach. Through learning approach science process skills, students' understanding of concepts and principles that will be studied more in depth because it opens wider opportunities to assimilate and accommodate the information

obtained solely through the process of science is doing; in addition, encourage the development of self-understanding, responsibility, and an increase in social and emotional intelligence of students better. This is impossible when the teacher-centered learning.

Discovery Science Teaching Approach-Inquiry

Learning science-based discovery-inquiry, should be the key issues that should be the subject of study for teachers, especially teachers of science, as occurs in developed countries. Various studies presented dalamNational Research Council, shows that the "Inquiry into authentic questions generated from student experiences is thecentral strategy for teaching science" (National Research Council, 1996). The learning model approach to discovery-inquiry often called learning berbasisdiscovery-inquiry, consists of five steps called 5ES-engage, explore, explain, elaborate, and Evaluate-and is based on a constructivist philosophy of learning (Teacher Created Materials, 2009) , The five steps are: Engage: In this step, the teacher introduces a topic or concept by asking questions, demonstrations or present an event that contains puzzles (puzzeling event) that generate interest, raises admiration, or challenging. Activities are designed to stimulate interest, curiosity, and the students' attention. At this stage, the teacher is not looking for the "right answer", but rather to encourage students to dare to express or speak so that it can be seen what is already known to the students regarding the topic and discuss what else you want to know the students.

Explore: During the exploration, the students are guided to perform a variety of problem-solving activity or experiment designed to help them explore topics and connect with other concepts related. This activity is designed to help students to understand the topic in a more meaningful memlaui discovery-inquiry process, while developing science process skills and the transformation of scientific attitude in students. These activities are carried out in a group or team. During this stage, students share experiences related to the topics / issues, while the teacher acts as a facilitator, providing support / material needed, and guide the students to stay focused.

Explain: In this step, the teacher helps the students in the patterns, analyze the results, and / or drawing conclusions based on the activities and investigations that have been carried out. At this stage, the teacher also helps to affirm straighten meaning of newly learned concepts and vocabulary relevant.

Elaborate: At this stage, students build concepts or ideas they have learned and make connections with other concepts related and

menghubungkanya with new situations in a real-world context.

Evaluate: In the last step, teachers evaluate or assess students' understanding of the topic is newly learned. Evaluation can be done formally or informally, but should be able to reveal clearly, what you have understood the students related to the topics that have been learned through learning activities that have been dikutinya.

CONCLUSIONS AND SUGGESTIONS
Conclusions

The main characteristics of the national curriculum which is a translation of the curriculum in 2013 is to develop a balance between the spiritual and social development of attitudes, curiosity, creativity, cooperation with intellectual and psychomotor ability, as well as develop the attitudes, knowledge, and skills in relation to the real-world context.

Science and dynamically developing teknoilogi which essentially includes three elements, namely: 1) scientific attitudes: beliefs, values, attitudes and other affective aspects inherent in the individual that influences the way of thinking, acting, and acting; 2) the process of science or the scientific method: the systematic investigation undertaken to solve the problem; 3) product: the facts, principles, laws, theories, and so on as the conclusion of a series of results of scientific processes.

Discovery-inquiry-based learning, consists of five main steps, namely: engage, explore, explain, elaborate, and Evaluate. This learning is suspected can improve students' understanding of learning content (product of science), while developing science process skills and scientific attitude.

Suggestions

Teachers are encouraged to constantly strive to learn and understand the curriculum nasionalserta keep the commitment and enthusiasm to implement the best possible way.

Make learning by discovery-inquiry approach or scientific approach to become a major review to be developed according to the conditions and characteristics of the schools served students.

Mastered the subject matter, the scientific process skills, and scientific attitudes that will be taught and believe that learning steps undertaken to develop ketiganyya and you are able to do before learning implemented.

THE EFFECT OF GROUP GUIDANCE SERVICE WITH ROLE PLAYING TECHNIQUE ON THE ABILITY OF NONVERBAL COMMUNICATION ON CLASS XI IPS

Nani Barorah Nasution

State University of Medan, Indonesia

e-mail: ….

ABSTRACT

The purpose of this study is to determine whether nonverbal communication skills on class XI IPS 4 SMAN 6 on Academic Year 2015/2016 will increase after being given guidance services group with role playing technique. This research is a quasi-experimental design with pre-test and post-test. Data were collected by using a nonverbal communication skills questionnaire which consists of 31 items, then the questionnaire were tested and analyzed by researchers to obtain valid and reliable first. The sample in this study were taken by using purposive sampling method from class XI IPS 4 SMAN 6 on academic year 2015/2016 with 36 students. The function of questionnaire is to determine the level of nonverbal communication skills of students, 10 students obtained low nonverbal communication skills and need to get guidance group service with role playing technique. From the results of the analysis of the obtained data of Pre-Test shows the average ability of students' nonverbal communication is 5,5 that is included as low category, and average of Post-Test is 18,2 that is included as high category. Hypothesis testing technique use the Wilcoxon test formula or Jtest with the result is Jtest > Jtable = (27 > 7), then there are significant effects between the execution of the guidance group service with role playing technique in improving nonverbal communication ability of the students of Class XI IPS 4 SMA Negeri Medan 6 on academic year 2015/2016 on the real level of = 0,05.

Keywords: guidance group service, role playing, nonverbal communication

Humans are social creatures. S/ he can only thrives and acts as a human with relate and work together with other human beings. Wherever people live and whatever their work, people are always need of communication with others. So not only lecturer, student, politician, lawyer, seller, or preacher who must be skilled at communicating, but almost all positions and circles. According to Mulyana (2010: 6) people who have never communicated with humans can be sure will "get lost", because they did not have time to organize themselves in a social environment. Communication is allowing individuals to construct a frame of reference and use it as a guide to interpret any situation s/ he faced. The communication also enables them to study and implement adaptive strategies to address the problematic situations which they entered. The communication seeks to bridge between thoughts, feelings and someone's needs with the world beyond. Communication build people' contacts by showing the existence of her/ himself and trying to understand the will, attitudes and behaviors of others.

The nature and character of each person is very different and sometimes is difficult to predict. Often, we snapped at someone's behavior who has been predicted good, apparently have unpleasant character that unknown by anyone. Appearance and word often deceive us. Therefore, communicate is the most important things to find out in how one

actually is. So that, we get an idea of how to understand other people, both of deficiency or excess. High School students entered the stage of development of the mid-teens. Adolescence, according to Mappiare (in Ali & Ansori, 2011:9), took place between the age of 12 up to 21 years for women and 13 years up to 22 years for men. Teenagers are among children and adults. Therefore, teens are often known by the phase of "searching for identity" or "typhoon and hurricane". At the stage of mid-teens desperately need friends. There is a narcissistic tendency is to love her/ himself, by more like friends who have nature in common with her/ him. At this stage the teenager in a condition of confusion because it is still hesitant to choose, sensitive or caring, in a group or alone, optimistic or pessimistic, and so on.

On the grade XI IPS 4 of SMA Negeri 6 often happened misunderstanding in communication with students of other classes due to lack of sensitivity towards nonverbal behaviors so that can disrupt the socializing between the students of the school. This is caused by students in grades XI IPS 4 of SMA Negeri 6 haven't been able to understand the nonverbal communication very well. Nonverbal communication skills is very important for students of SMA Negeri 6 in order to avoid conflicts between the members of the school community.

Based on the data above, the authors see that teens need help to understand the nonverbal language. This can be done by the teacher in the BK. Changes that occur during adolescence will

affect individual behavior depends on the ability or willingness of individuals at adolescence to express concern and anxiety to others, so that he can gain a new perspective and better. In order to resolve problems that are often found in SMA Negeri 6 Medan, there is one of the techniques in counseling to provide aid to students conducted by a coach/ counselor through the activities of the guidance group services that can be useful to prevent the development of problems faced by students. In the guidance group services, there are several number of techniques, namely home room, field trips, discussion groups, group activities, student government, socio-drama (role playing), psychodrama, and teaching remedial (Tohirin, 2007:273). From some of the techniques above, the author uses role playing with the aim to help students find a sense of self (identity) in the social world and solve the dilemma with the help of the group. " That is, through role playing students learn to use the concept of roles, aware of the different roles and the thought of her/his behavior and the behavior of others.

The group is a group of people who have a common goal that interact with each other to achieve a common goal, to know each other, and looking at them as part of the group. The holding of guidance is necessary in order to achieve the purpose of the group. According to Gazda (Prayitno, 2004:309) suggested that the guidance group in schools is an activity information to a group of students to help them make a plan and the right decision. According to Prayitno (1995:36), guidance group is a service of guidance and counseling which allows the number of learners together through group dynamics acquire a variety of materials of certain resource persons (especially of Teachers Advisors) that are useful to support the understanding and his daily life and/ or for their development as individuals and as a student, and for consideration in decision making and/ or specific actions.

According to Hamalik (in Rafael, 2012:42), role playing is a type of simulation techniques which are commonly used for social education and human relations where in this role playing technique involves individual human beings and their behavior or interactions between the individuals in the form of dramatization. Santrock (in Rafael, 2012:42) stated that role playing is an activity which is fun. Furthermore, role playing is an activity carried out by someone to gain pleasure. Role playing is a method of guidance and counseling group that performed consciously and discussions about the role in the group. In the

classroom, a problem practiced briefly so that students can recognize the characters of the figures like what the student act or become the opponent that has or gets other role. Santrock also states that the role playing lets children overcome the frustration and it is a medium for the therapist to analyze children's conflicts and the ways they resolve.

Humans are social creatures. S/ he only can thrives and acts as a human with relate and work together with other human beings. One of the most important ways to relate and work together with humans is communication. According to Rakhmat (2001:9) suggests communication is social events, events that occur when people interact with another human being. Through communication, we find ourselves, develop self concept, and set our relationship with the world around us. Nonverbal communication according to Hall (in Mulyana, 2010:344) says this nonverbal language as the "language of silence" (silent language) and "the hidden dimension" of a culture. Called silent and hidden, because nonverbal messages embedded in the context of the communication. In addition to the relational and situational cues in the transaction communication, nonverbal messages give us contextual cues. Along with the verbal cues and contextual cues, nonverbal messages help us to interpret the whole meaning of the communication experience.

METHOD

This research is the kind of Quasi Experimental, i.e. research that provides treatment to a group of students. Such treatment is guidance group services with role playing technique.

The sampling techniques used in this research is purposive sample. The author choose the class XI IPS 4 SMA Negeri 6 which has 36 students and select 10 students who have low abality and lack of nonverbal communication as sample.

The instrument of collecting data is used to find out the ability of the students' nonverbal communication is questionnaire. According to Arikunto (2010:268) questionnaire is the "set of questions submitted in writing to the person or in this case referred to the respondent and how to answer is done in writing". The questionnaire is used because it can collect a lot of data in a relatively short time compared to other techniques, such as interview. In questionnaire will be used Guttman scale which question is answered correctly will be given a score of 1 (one) and the question is answered incorrectly will be given a score of 0 (zero).

According to Arikunto (2010:199) in the sense of prikologis, in observation there are the activities of loading of attention to the entire object by using all of the senses. So, observing can be

done through sight, smell, hearing, touch, and taste. This is actually a direct observation.

RESULTS AND DISCUSSION

The data in this study are obtained by performing a measurement on nonverbal communication ability of students by giving the question form before implementing the guidance group service with role playing (pre-test) and after the implementing of the guidance group service with role playing (post-test)

Testing Requirements Analysis

Implementation of a test question form about the communication skills of students conducted against 32 students outside the sample. In this test phase, the researcher asked the willingness of 32 students to fill out the question form on the actual state of students earnestly and honestly because in question form is not judged right or wrong answer.

After the question form accumulated, then performed an assessment of the questionnaire by making a format based on the value of the scores on every question form then score which is a subject choice at every item of questionnaire are tabulated and processed manually.

The Validity of Questionnaire of Students' Nonverbal Communication Ability

The function of the question form test is to find out whether the instrument is feasible used to obtain data on nonverbal communication skills of students using Product Moment Formula. Based on the calculation of correlation coefficients, it is obtained that correlation coefficient validity of item number 1, it is known rvalue = 0.890 where N= 32 at significance level α = 5%, then it is known rtable = 0.3494. From these results it can be seen that rvalue is greater than r table (0.890> 0.3494). Based on these data, it can be concluded that the item numbers 1 of question form about learning skills declared valid and can be used for data collection. From the 50 items, now are deployed there are 31 known valid item (can be used to obtain data) and 19 items reserved are not valid, i.e. question no. 7, 14, 15, 16, 19, 23, 25, 26, 27, 28, 30, 32, 35, 36, 37, 38, 42, 46, and 49. So the question form has 31 items which is awarded against 10 persons as the subject.

The Reliability of Questionnaire of Students Nonverbal Communication Ability

Based on the results of the calculation using Alpha Formula, it is known that r11 = 0.62 and after having consulted with the

correlation index, it is included in the high category. Thus it can be concluded that the question form of students communication abilities have met the criteria of reliability so that it can be used as tool of collecting data to determine the sample.

Description of Data research results

The Pre-test Data of Students' Nonverbal Communication Ability

Pre-test data calculation can be seen in table 3, as follows:

Table 1: The results of the Pre-test (Before given guidance group service)

Number of Respodents	Score	Category
1	6	Low
2	5	Low
3	5	Low
4	7	Low
5	6	Low
6	3	Low
7	8	Low
8	4	Low
9	6	Low
10	5	Low
Total/ Average Score	55/5,5	

The Post-test Data of Students' Nonverbal Communication Ability

Post-test data calculation can be seen in table 4 below:

Table 2: The results of the Post-test (After being given guidance group service)

Number of Respodents	Score	Category
1	10	Medium
2	21	High
3	16	Medium
4	18	High
5	20	High
6	24	High
7	25	High
8	18	High
9	19	High
10	11	Medium
Total/ Average Score	182/18,2	

From table 2 is known that there are 3 students have the ability of nonverbal communication in the category of medium and 7 students have the ability of nonverbal communication in high category. On post-test the highest score is 25 (high category) and the lowest score is 10 by medium category, average score = 18.2

Based on table 1 and table 2, there is increasing the ability of students' nonverbal communication as follows:

Table 3: Description of Pre-test Data and Post-test Data

Number of Respondents	Pre-test		Post-test	
	Score	Category	Score	Category
1	6	Low	10	Medium
2	5	Low	21	High
3	5	Low	16	Medium
4	7	Low	18	High
5	6	Low	20	High
6	3	Low	24	High
7	8	Low	25	High
8	4	Low	18	High
9	6	Low	19	High
10	5	Low	11	Medium

In table 5 show that students who are classified as low at pre-test as many as 10 people, while in the post-test (after being given guidance group service) were not found students who belong to low nonverbal communication skills (high 70% and 30%). It can be concluded that there is an increase in the ability of students' nonverbal communication after given guidance group service with role playing technique.

Hypothesis testing

Hypothesis testing is done with the Wilcoxon test calculation. From the calculation, it is obtained that Jcount = 26 for number of respondents N = 10 people and retrieved Jtable = 8. In accordance with the criteria of acceptance and rejection of the hypothesis, then the hypothesis is accepted at significance level of 5%. Thus declared that guidance group service with role playing technique has a contribution in improving the nonverbal communication skills of students of Class XI IPS 4 SMA Negeri Medan 6 on academic year 2015/2016, it is seen from the average score of students ' nonverbal communication ability at the time of pre-test = 5.5, after the guidance group service with role playing technique (post-test) increased to 18.2.

Discussion

From the results of data analysis using the Jtest, is obtained that Jtest= 26 for the number of respondents N= 10 and Jtabel= 8. Which means that Jtest > Jtabel = (26> 8). Then the hypothesis that there are significant effects of group guidance service with role playing technique to improve nonverbal communication skills on class XI IPS 4 SMAN 6 on Academic Year 2015/2016.

CONCLUSION & SUGESTIONS
Conclusion

From the results of research data is categorized tahe students have the ability of nonverbal communication that is low is 10

people. Then from the final results of the research is obtained 70% of the students already have the ability of nonverbal communication. This can be seen on the basis of the average post-test is 18,2. Based on the results of pre-test and post-test may be inferred that there is an influence of the guidance group service with role playing technique against the ability of nonverbal communication on students of Class XI IPS 4 SMA Negeri Medan 6 on academic year 2015/2016, it is known from the calculation result is obtained that Jtest > Jtabel = (26 > 8). Then the hypothesis stated that there is a significant influence of guidance group service with role playing against nonverbal communication ability of the students of Class XI IPS 4 SMA Negeri Medan 6 on academic year 2015/2016, is acceptable.

Suggestions

Based on the conclusions above, researchers ask some advice that is: a) For BK teachers, BK teachers are expected more concerned in an attempt to improve the ability of students nonverbal communication, through the activities of the guidance group service; b) For schools, It is hoped that the schools can provide infrastructures and facilities that are better in guidance counseling activities at school.

STUDENT'S PERSPECTIVE IN USING QUIPPER IN TEACHING AND LEARNING ACTIVITIES FOR SENIOR HIGH SCHOOL IN JAKARTA

Neneng Zubaidah; Yosi Andarin
State University of Jakarta, Indonesia
Email : nzubaidah1@gmail.com

ABSTRACT

In this digital era, technology cannot be avoided from any aspect of human life. It grows demands on almost everyone, including students to become technologically literate. The Digital technology and education are both recognized as essential to a global future. In Indonesia, ICT grows rapidly and the student changes radically. They think and process the information fundamentally differently. To encourage the students to improve their knowledge through the use of digital technologies, Quipper School as an e-learning service is designed comprehensively for teachers and students to help learning process continue effectively with the benefit of digital technology. Using this service, teachers can manage classes and assign classes work or homework easily and efficiently. There are some factors which are affected to the learning process using Quipper School, supporting effect and inhibiting effect. In order to improve Quipper in ELT, the researcher wants to know what are students perspective through the Quipper School. From the findings of this research, the researcher are hoped to improve the quality of Quipper School because ICT can promote lifelong independent learning skills.

Keywords: *digital technology – ICT – quipper school - student perspective.*

Learning elements include learning objectives were formulated clearly, the subject matter are arranged in a coherent and up to date, means learning infrastructure adequate learning conditions comfortable, use appropriate learning methods, the use of media that is able to support the students learn better, learning resources is not limited to textbooks but use digital media are easily accessible, and the evaluation is done by involving students. Application of optimal learning elements will affect the success of learning and improve student achievement. Learning conditions in fact show different things, during the implementation of the learning process is still ignoring some elements of learning, including learning objectives have not been formulated clearly, the subject matter is not well organized, learning methods were not appropriate and teachers have not applied media innovative learning that encourages students to learn better, resulting in lower student achievement.

During this time, teachers are still using traditional learning media is limited to the print module. According to Nasution (2005) the use of print modules as a learning medium still has some shortcomings, among others: (1) costs more, (2) students become passive and will have difficulty learning because accustomed to receiving lessons from teachers through listen, (3) students must arrange a time to learn the discipline, (4) students accustomed to regard the teacher as the main source of learning so that the use of a variety of sources, methods and

media into difficulty, (5) prepare the module takes a lot of time, effort and requires considerable expertise, (6) learning module requires a lot of facilities.The shortcomings of the use of the print module in learning, teachers should make to further innovate and choose the alternative media that correspond to the learning objectives to be achieved, so as to encourage students to learn better and increased learning achievement. The use of innovative media will also improve motivation and attention to students in understanding the subject matter.

The learning activities are still dominated by lecture method and delivery of learning materials is limited to the print module. Nasution (2005) explains that the use of the print module enables students to be passive and will have difficulty learning.

This is evident in the behavior of students when the learning process English takes place. Most students do not pay attention to the teacher's explanation, chatting with other friends, play games, and access to the internet which is not related to the subject matter. Some of the students also argued that English elusive and confusing so that their participation is reduced.QuipperSchool (QS) an e-learning service that is designed comprehensively for teachers and students to help the learning process continues effectively with the benefit of digital technology. The Digital technologies and education are both recognized as essential to a global future. Quipper School advance and empower teachers with students

online, increase knowledge and improve learning outcomes (Kusuma, 2015).

School Quipper integrate and empower teachers with students online, increase knowledge and improve learning outcomes (Kusuma, 2015). Teachers can create assignments for a class, group or individual and get immediate feedback on student performance. Recognizing the strengths and weaknesses of students is very easy. Online learning facilities provided Quipper School provides ease of school teachers, such as giving tasks and materials to the students, so the teacher does not have to correct the results of learners for automatic learning outcomes. students will be examined by the existing system in Quipper School, in addition to the ease of online learning platform service teachers could arouse the interest of learners. By using Quipper school learners are expected to master certain topics, increase their knowledge while enjoying the social features. Quipper School of interesting and like games. Learners can use Quipper School at home or wherever they can get an Internet connection (e.g. Internet cafe, library and android mobile phone). Quipper School can be accessed from any device in 24 hours a week.

Media Quipper school learning provides many benefits, but its use requires some support. Martia SMA Bhakti Jakarta has several problems facing the learning process, one of which is the Internet network is not up to class and only certain areas are inaccessible. Although there are obstacles, the students are very interested when learning a new breakthrough media collaborated with the improvement of technology and science has increased to see the effect of using the media to improve learning outcomes.

METHOD

The materials to be evaluated in this study included students perspective when using Quipper school in learning activities. The data collection utilized in this study was questionnaire prepared by the researcher. In order to do so, several questionnaire were scrutinized and the items relevant to the students perception about learning and teaching by using Quipperschool.com. A 10-item questionnaire was so prepared, and a pilot study was conducted with 33 students of SMA Martia Bhakti Bekasi. The questionnaire (see appendix) included 10 questions.

The population for this study was consisted of one class selected in SMA Martia Bhakti Bekasi. The sample included of X.6 class out of which 33 students (22 female 11 male).

The purpose of this study was to evaluate the students perspective in using Quipperschool.com in SMA Martia Bhakti Bekasi. In order to do so, the following steps were taken. After a pilot study of the questionnaire prepared by the researcher, the 10-item questionnaire about students perceptionin using Quipperschool.com was finalized. The questionnaires were collected a few hours later so that the participants would have enough time to reflect on the questions. Later these survey results were quantified and analyzed in order to answer the research questions.

RESULTS AND DISCUSION
Results

Based on the results of research show that learning with school Quipper give better effect than on learning with conventional methods. Descriptive analysis is used to describe the percentage of each the independent variable is the use of instructional media Quipper school and learning outcomes dependent variable.

In this analysis used the formula to determine the level of the percentage scores of each respondent. For analyzing the survey data collected by means of the questionnaire, first the answers were quantified. Each option of the items was ranked (1. To a great extent, 2. To some extent, 3. Not satisfactory, 4. Not at all). In order to provide a clear picture of responses given to the 10 items of the questionnaire, the items were analyzed. As can be seen, it was be concluded that Quipperschool are "to some extent" acceptable with 58.60% for students in teaching and learning activities. Considering "to a great extent" acceptable with 23.90% for students in teaching and learning activities. However "not satisfactory" cannot be considered acceptable with 16.32% for students in teaching and learning activities. As the last result of using Quipperschool are "not at all" with 1.16% not acceptable for students in teaching and learning activities. Student Perceptions of School Learning Media Quipper Based on the results of the research questionnaire answers with students about media perception indicators Quipper school learning, the results obtained in the table 1.

CONCLUSION

Based on the research results can be concluded that: (a) Media Quipper helpful school are used in education, where students are attracted by the appearance of the media to increase knowledge and insight by reading the material and do practice questions, facilitate and complement the learning process and teach them to know the latest technology. It also helps teachers to collaborate in learning to avoid monotony and facilitate teachers in correcting values. Based on the research results

can be seen from 33 students stated the use of instructional media Quipperschool in the excellent category by 58.60%. (b) The use of instructional media Quipper school in SMA Martia Bhakti constrained so that learning is ineffective and inefficient due to the Internet network is not up to class and only certain areas as well as the material in Quipper school can not be downloaded.

Table.1 descriptive analysis percentage of student's perspective in using quipper in teaching and learning activities for senior high school in Jakarta

N o.	Questions	Sangat Setuju (SS)	Setuju (S)	Tidak Setuju (TS)	Sangat Tidak Setuju (STS)	Total

CONTEXTUAL TEACHING AND LEARNING OF GEOMETRY IN ELEMENTARY SCHOOL

Ni Luh Sakinah Nuraini
State University of Malang
Email: niluh.sakinah.fip@um.ac.id

ABSTRACT

Geometry is the part of mathematics school curriculum. This field provides students for having experience in mathematical reasoning and thinking. Students found to get hard for understanding it content. However, many parts of our cultural life consist of visual figure that correspond with geometric principles. This fact should be introduced for teaching geometry in school. The usage of contextual learning in teaching geometry helps students to understand geometry principles and connect it through their life.

Keywords: *contextual teaching and learning, geometry, elementary school*

Curriculum 2013 on elementary school designed learning activities based on integrative thematic and scientific approach. These approach were designed to develop children knowledge based on their experience, implied in their social and school environment. To develop these kind of experience in mathematics field, school should develop student centered learning activity. In fact, school and teacher has giving much attention on thematic and scientific approach, but they cannot specify them on learning activity. This problem was identified as a main problem that caused these approach cannot perform well on school. Elementary school and teacher tend to not understand these approach concept to build in class, so they have difficulties on design them on lesson plan. This condition were made learning activities cannot perform well (Akbar et al, 2015).

As a one of subject in elementary school, mathematics should teach based on students' experience. Teacher cannot only tell its concept and finish it by question related on it. For better experience, students should build their mathematics understanding based on their own experience. According to Hudson and Whisler (2008), one conception that suitable for helping teachers relate subject content into real life situations, is contextual teaching and learning. By using this conception, elementary teachers could designed learning activity that help students connect what they learn with their life and construct their knowledge from the learning process. On previous study, Riyanta (2010) used contextual teaching learning as a learning concept for enhancing students understanding on three-dimensional figures patterns. The result of this study showed that contextual teaching and learning enhanced students'

understanding and motivation on learning geometry.

Geometry as a part of mathematics have a rich content that connect to daily life. Many figures in daily life can be used as a media for learning geometry. Problems for teaching and learning geometry are lack of student' activities on learning process. This condition should get teachers' attention, especially to create student oriented learning activities on some class action researches for solving the problem (Mansur, 2010; Riyanta, 2010; Suardi, 2013; Subarkah, 2016).

DISCUSSION
What is Contextual Teaching and Learning?

Contextual teaching and learning (CTL) is a concept that can be used to help teachers make connections between subject matter and real life situations (Sears, 2003). Not only for teachers but also for students, this concept make connections between their knowledge and how its application in daily life. The main purpose of this concept is to help students become self-regulated learners. Students can find that learning should be taken in any place, wherever it is, not only in a small classroom. Thus, their experience can be used as learning resources that aim at meaningful learning for them.

Sears (2003) defined strategies related to contextual teaching and learning. The first strategy is self-regulated learning. This strategy use for both teacher and student. By this strategy, teacher can perform well in choosing the learning material, giving motivation, and preferring the best learning style for them. On the other hand, student can understand their learning style, know how the best they learn, apply their knowledge, and connect their present learning to their future activities. In fact, not all students can be a self-regulated learner, teacher can encourage them into that direction. This

strategy should be done for better teaching and learning process.

The second strategy is teaching and learning in multiple contexts. This strategy give students widely opportunities to frame their knowledge in many contexts in daily life. Teachers should pay attention to the variety learning experience that students should be done. By using variety of contexts, inside or outside the school, students learning will occur naturally anywhere. The third strategy is problem based learning. Problem based learning enhance students' creative critical thinking by apply, analyze, synthesize, and evaluate their skill and knowledge to solve the problem. The problem itself can draw in varied contexts, to show students connection between the subject material and their daily life experience.

The fourth strategy is interdependent learning groups. Learning is a social process. Contextual teaching and learning (CTL) need collaboration between students to interact about instructional activities. In collaborative and interactive learning, students get opportunity to learn various ideas and give feedback. This condition can improve students' self-esteem, help them feel safe to share their ideas, and participate on learning process actively. The fifth strategy is authentic assessment. The authentic assessment is used in curriculum 2013. This assessment make a qualitative report card. This help students' parents to see their children's learning progress in many aspects with the evidence include on it (such as portfolio).

While contextual teaching and learning are relevant thoroughly researches, the problem that educators are faced became more complex day by day. How teachers help students to construct their own knowledge become more important. Students should actively explore subject content in multiple context in order to learn how to solve a problem, complete a project, or touch their goal of study (Hudson and Whisler; 2008). This kind activities are needed to meet the expectation of meaningful learning as a part of long life learning.

Geometry on Elementary School

Geometry is the part of mathematics school curriculum. The aim of learning geometry is to understand geometric elements, make connections between them, and solve the problem related on it (Safrina et al, 2014). Contextual teaching and learning (CTL) used in class action research on elementary school geometry show that CTL can improve students' learning process (Subarkah et al, 2013; Mansur, 2010) and students being active during learning

process. CTL also improve students' understanding on geometry and improve their motivation on studying mathematics (Riyanta, 2010).

Yildiz and Baltaci (2016) use contextual teaching and learning through GeoGebra software to the elementary preservice mathematics teachers. The case study was conducted in cylindrical and spherical coordination learning in a meaningful way. Despite learning it depend on patterns, Yildiz and Baltaci check their ability to associate objects and their coordinates on the plane and space, such as key closet, lamp hung from the ceiling, and glass. This study support another findings that using concrete material help students' acquire experience and might help them develop in mathematics and geometry.

Concrete materials used in teaching and learning geometry were varied based on the subject material. Another alternative materials for studying geometry is the usage of local potential, such as traditional house. Bintoro and Zuliana (2013) use Kudus traditional house as a media for teaching and learning geometry on trapezoid area. This study design mathematics learning of geometry in the context of Kudus traditional house. Students invited to know Kudus traditional house by LCD projector, the purpose of this slide was students understand the shape well. The next step was directed students to relate the figure with trapezoid area. Besides showing Kudus traditional house in the slide, students were given trapezoid area media manipulative to help them solve problems in the worksheet. From this study, students learning their traditional house and mathematics content at the same time, which is encouraged teaching and learning in elementary school using thematic approach.

Another traditional house for teaching and learning geometry is Java traditional house. Java traditional house have an interesting form. For example, based on the roof shape, Java traditional house differ as *Panggangpe, Kampung, Limasan, Tajug* and *Joglo*.
Picture above taken from Prihatmaji (2007). Besides looking this picture in the architecture point of view, this picture can be seen in the geometry point of view as we can see parallel lines, adjacent lines on the roof. So that, we can design

learning material based on the Java traditional house' roof pattern. Using culture as a context of learning mathematics is part of an approach on learning mathematics, called ethnomathematics (Rosa & Orey, 2011). This approach can be developed students' understanding mathematics based on another contextual term, culture. the field of ethnomathematics link students' knowledge through the use of cultural embedded with mathematics in curriculum.

CONSIDERATION

Mathematics is known as hard material to learn. Pervious study showed that contextual teaching and learning concept can improve students' understanding and motivation on learning mathematics, especially on geometry. The use of context in elementary school mathematics, related to thematic and scientific approach used in Curriculum 2013.

Mathematics cannot free from social interfere and culture. The use of context beside its content could develop students' understanding in answer these two questions: what is mathematics content they learn so far and how it can be applied in their life or how it connected with their daily life. The use of concrete material that related to their daily life, their culture, also important to improve students' understanding on geometry.

PRIMARY TEACHERS' ABILITY IN DESIGNING AND SOLVING CONTEXTUAL PROBLEMS IN DIVISION WHOLE NUMBERS

Niluh Sulistyani; Hongki Julie; Veronika Fitri Rianasari

Sanata Dharma University, Yogyakarta

E-mail: niluh@usd.ac.id

ABSTRACT

This study was aimed to describe primary school teachers' ability in designing and solving contextual problems especially in division of whole numbers. This research was held in KanisiusDemangan primary school in Yogyakarta with the subject 14 teachers. Data collection was gathered in the form of the written test at the end of the workshop. Thetest showed that there were 8 teachers that had good ability in designing and solving contextual problems in division whole numbers, 3 teachers not written the contextual problem, and the other, 3 teachers had study to design contextual problem in division whole numbers. From the analysis, we found that a teacher is struggling in understanding the concept of the division on whole numbers andthere were 5 strategies used by the teachers in solving the problems. The strategies are multiplication invers, using horizontally repeated subtraction, vertically repeated subtraction, and modeling the contextual problem using pictures that closely related to the context.

Keywords: primary teachers, ability in designing and solving problem, contextual problems, division.

Nowdays, the quality of mathematics educations in Indonesia needs to be improved. The result of PISA and TEAMS shows that the competence of students in mathematics is still lacking. Indonesia was in rank of 64 from the 65 participating countries in 2012 and in 2015 Indonesia was in rank 69 from the 75 countries participating in PISA. PISA evaluates literacy skills, the skill to solve contextual problems in mathematics and application problems in mathematics. From the result indicates that ability in solving contextual problems in mathematics is still lacking.

TIMSS evaluates mathematics ability on 8th grade student in the content of number, algebra, geometry, data and change. One of competence in number especially whole numbers is compute $(+, -, \times, \div)$ with whole numbers (Gronmo, et all, 2015). The result of TIMS shows that mathematics achievement of Indonesia students was in rank 36 from the 49 countries in 2007 and in 2011 was in rank 39 from the 43 countries participating in TIMSS. We can say that ability in numbers domain is still lacking.

There are many factors that influence the lacking of ability both on numbers ability or literacy ability that include ability to solve contextual problems. One of the factors is teacher, especially primary teachers. Campbell,et all (2014) said that mathematics ability and pedagogy ability of primary teachers have positive correlation with student achievement in mathematics. Primary teachers teach basic competence in mathematics for the children, they formalize thinking pattern in

mathematics to the students. Because of that, it is necessary to improve mathematics skill of primary teachers.

The result of study that done by Hadi (2002) shows that developing model to improve teacher's professionalism is introducing a new approach in learning mathematics that can enrich knowledge and increase teachers ability in mathematics. That approach is PMRI. Learning trajectory in PMRI is illustrated as ice-berg that concludes of mathematical world orientation, model material, building stone; number relations, and formal notation (Atmini, 2010). Mathematical world orientation means using contextual or daily problems to construct mathematics thinking. The solving of that problem is using model material, number relations, and formal notation. Based on the reasons, this study aims to describe primary school teachers' ability in designing and solving contextual problems especially in division of whole numbers.KanisiusDemanganBaru primary school wants to improve students achievement in mathematics, so this study is held in KanisiusDemanganBaru primary school.

PMRI is adapted from RME, Realistic Mathematics Education that occurred in Netherland. Realistic mathematics education is founded by Freudenthal. RME take starting point in the activity of mathematics, whether pure or applied mathematics. Activity of mathematics is as an activity of problem solving, looking the problems and organizing a subject matter-whether mathematical matter or data from reality. Marpaung… said that Learning trajectory in PMRI is illustrated as ice-berg that concludes of mathematical world orientation, model material,

building stone; number relations, and formal notation (Atmini, 2010).

The key process and goal for realistic mathematics educations is mathematizing, this can involve mathematizing mathematics and mathematizing reality.Realistic mathematics educations elaborate three key principles that can be seen as heuristics for instructional design. They are 1) reinvention/mathematizing, 2)didactical phenomenology, and 3) self-developed models (Gravemeijer, 1994).

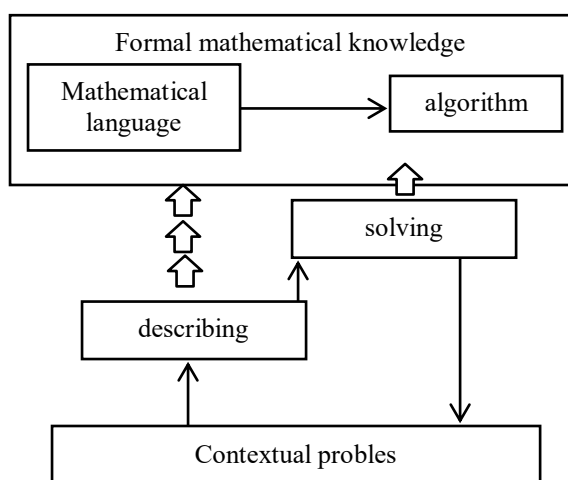
Reinvention/mathematizing similar solution procedures create the opportunity for the reinvention process. Reinvention process can be look at figure below.


Figure 1. Reinvention (Gravemeijer, 1994: 94)

According didactical phenomenology, situations where a given mathematical topic is applied are to be investigated to reveal the kind of applications that have to be anticipated in instruction and to consider their suitability as points of impact for a process of progressive mathematics (Gravemijer, 1994: 90). Self-developed models play in bridging the gap between informal knowledge and formal mathematics.

The three principles of realistic mathematics education approach explain that to learn a material such as long division is based on student activities. First, division is associated with real-life activities, here students bring on their situation knowledge and strategies and apply them in the situation. This step is not boundaries by procedure. The next, students create a model of this situation, division problem is modelled by repeated subtraction. The last, the students write algorithm for long division.

From the explanation of realistic mathematics education, PMRI also based on the

mathematics philosophy that mathematics as human activity. Similar with in realistic mathematics education, in PMRI a problem is called realistic problem if that problem can be imagine by students. PMRI approach is a method used in teaching and learning mathematics by associating learning to imaginable situation by students or to daily life problems (Wijaya, 2011).

METHOD

The subject is 14 KanisiusDemanganBaru primary teachers. The teachers are not only mathematics teacher but also class teachers. This is a qualitative research and data collection was gathered in the form of the written test. Primary teachers' ability in designing and solving contextual problems in division of whole number is based on PMRI approach which to explain division whole number must be presented in contextual problems in real life before be solve with many strategies. Based on PMRI, there are many strategies to solve division problem. There are informal procedures (dividing on a geometrical basis, distributing one by one, grouping, using multiplications fact) and formal procedures (repeated subtraction and long division). Data are analyzed qualitatively by data reduction, data presentation, and conclusion (Miles and Huberman, 1994).

FINDING AND DISCUSSION

After primary teacher school is introduced about PMRI approach, they do test to measure ability in designing and solving contextual problems. Based on PMRI theory, teaching and learning must be associated with imaginable problems or daily life (Wijaya, 2011). First problem in test is how to design contextual problem 48÷6. After designing in contextual problem, teachers solve the problem. There are many solutions wrote by teachers.
Figure 2. Error Sample in Modeling Contextual Problem in Division

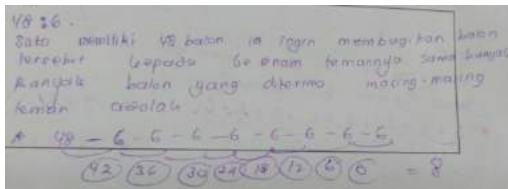
Figure 2 shows that teacher has problem in solving contextual problem especially modelling the problem. Modelling the problem is unstructured procedure to make imaginable problem for students. The correct one, division number i.e 6 must illustrate the number of circle and not number of apple.Besides that, teacher only write the contextual problem without solve the problem.


Figure 3. Correct Sample in Designing Contextual Problem in Division

Figure 3 shows that teacher can design the contextual problem and solve the contextual problem. The contextual problem solve by horizontally repeated subtraction strategy. 6 other teachers, 3 of them don't write the contextual problem and 3 of them had study to design contextual problem as a Figure 3. The similar error also is found on answering other division problem in figure below.
Figure 4. Other Error Sample in Modelling Problem

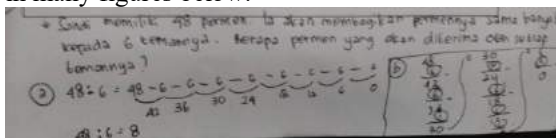
After teacher designing the division problem to contextual problems, the teachers solve the contextual problems. Data test show that there are many strategies used to solve the division problems. The strategies are horizontally repeated subtraction, vertically repeated subtraction, long division, and using multiplication invers. The strategies can be seen in many figures below.


Figure 5. Horizontally and Vertically Repeated Subtraction Strategies
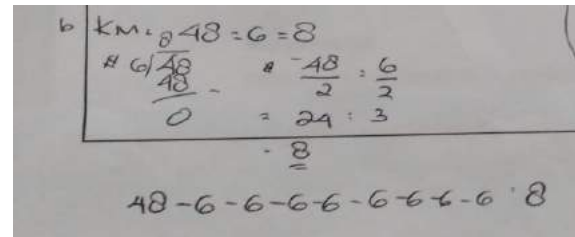
Figure 6. Vertically Repeated Subtraction Strategy and Multiplication Invers Strategy


Figure 7. Long Divison Strategy

Although many teachers can write the solution in division problems, many of them only write a strategy to solve contextual program. The completely data about primary teachers' ability in designing and solving contextual problem in whole number can be seen in table below.

Table 1. Completely Data of Primary Teachers' Ability

	Ability in Design CP			Strategies to solve CP
	Correct	Incorrect	No Solution	
T1			√	-
T2	√			Long Division(1), Horizontally Repeated Subtraction(2)
T3			√	Multiplication invers(3), Vertically Repeated Subtraction(4)
T4		√		Modelling (5)
T5		√		Not Correct in modelling (5)
T6			√	-
T7		√		Vertically Repeated Subtraction (4)
T8	√			Horizontally Repeated Subtraction(2)
T9	√			
T10	√			-
T11	√			Vertically and Horizontally Repeated Subtraction (2) and (4)
T12	√			Modelling (5)
T13	√			Vertically Repeated Subtraction (4)
T14	√			-

From the table, researcher can't conclude the ability of T1 and T5 in design and solving contextual problem of division. But there is one teacher that misunderstanding in solving division problems.

CONCLUSION

The test showed that there were 8 teachers that had good ability in designing and solving contextual problems in division whole numbers, 3 teachers not written the contextual problem, and the other, 3 teachers had study to design contextual problem in division whole numbers. From the analysis, we found that a teacher is struggling in understanding the concept of the division on whole numbers and there were 5 strategies used by the teachers in solving the problems. The strategies are multiplication invers, using horizontally repeated subtraction, vertically repeated subtraction, andmodeling the contextual problem using pictures that closely related to the context.

SYNECTIC MODEL IMPLEMENTATION TO IMPROVE CREATIVE THINKING SKILL OF COUNSELOR CANDIDATE

Nur Hidayah; Mirza Alfira
State University of Negeri Malang, Indonesia
Email: nur.hidayah.fip@um.ac.id

ABSTRACT

Preparing a counselor candidate as a reflective practitioner is essential to level-1. Counselor candidate will faced with various problems that need completion counselee appropriately. Learning at college doesn't lead skills to the formation of a reflective counselor candidate, one of which is to have creative thinking skills. In the learning process in Individual Counseling Practicum, more focused on the implementation of the stages of counseling. In this case, various learning activities are available for practicing creative thinking skill, one of which is synectic model. The purpose of this research is to improve the learning process and practice of counseling with trained creative thinking skills of students, including synthetic, analytical, and practical skills. The research design using classroom action research. Research subjects are student guidance and counseling in 2014. This action research was conducted in two cycles. The first cycle is done with the learning activities and counseling practical to REB and the second cycle is done with the learning activities and counseling practice Reality. Each cycle lasts five meetings with learning scenarios. This research resulted in quantitative and qualitative data were analyzed with descriptive statistics and interpreted qualitatively. The results showed that the model can be used to train analogy creative thinking skills in the learning process and counseling practice. Changes creative thinking skills of students can be seen from the score on the pretest-posttest in the first cycle and pretest-posttest in the second cycle. In the first cycle, students who have creative thinking skills as much as 32% higher category. The average score obtained by the students was 9.95 (58.58%). While on the second cycle, students who have creative thinking skills 77% higher category. The average score obtained by the students is 14.18 (74.63%).

Keywords: synectic model, creative thinking skill, counselor candidate

Counselors are experts in providing guidance and counseling services that are autonomous. Counselors in carrying out duties as a helping profession should have the two competencies of academic competence and professional competence. Academic competencies pursued through education Strata 1 (S1) study program of Guidance and Counseling and professional competence through education reached Profession Guidance and Counseling (Depdiknas, 2008; ABKIN, 2005). Academic competence prospective counselors prepared through learning in the S-1 among other in the course of counseling clumps. Learning counseling is a barometer of academic education provision S-1 Guidance and Counseling (Hidayah, 2009). In counseling learning, students demanded to bring creative thinking when collecting data, formulating problems, and finding the problem-solving strategies.

The results of reflection of the author's experience over 33 years supporting subject individual counseling clump, including Individual Counseling Practicum. Found students inability to construct a counseling framework with new and varied definitions as well as its inability to formulate the problem of the counselee in counseling practice. Students' difficulty to categorize problems to cognitive, affective, and behavioral. These conditions give rise to errors in the process of extracting data, interpretations data, and establishing counseling strategies. The inability of students to formulate the counselee is initiated by the inability of students to build a new idea in the form of a new definition of a counseling framework. Students have not been able to formulate new and varied counseling questions. Similarly, students are not accustomed to reflect together with colleagues at the end of the counseling practice. The condition indicates a low creative thinking skill of students in the learning of individual counseling practice.

Demands becoming creative counselors candidate has enshrined in the Indonesian National Qualifications Framework (KKNI) that is a graduate competence (learning outcomes) Study program (Dikti, 2013). Competence of graduates is in line with the concept of counselor characteristics. There are six characteristics of counselors, one of who has the ability to think openly or creative thinking (Neukrug, 2003). Education

counselor is expected to meet the characteristics of creative thinking. During his education S-1, through learning experience, the students are expected to become reflective practitioners (Schön, 1983). The actions of reflection shown in the reflection on action, reflection in action, and reflection for action (Killion and Todnem, 1991 in Haarmann, 2013).

Guilford reveals that creative individuals have the ability to look for ways in different ways (Cropley and Cropley, 2005) mainly in problem solving (Vidal, 2010). Sternberg and Lubart, 1999 in Villalba (2008) states that creativity is the ability to work producing original, unexpected, and precise ideas. Sternberg (2003; 2009) explains that creativity is one of factors the formation of reflective practitioners.

Individuals process information through three creative thinking abilities, namely synthetic, analytical, and practical. Synthetic thinking is the ability to see a problem into something new. Analytical thinking is the ability to recognize the valuable and precious ideas. Analytical thinking activities provide effective resources and are able to provide problems solutions. Practical thinking is the ability to persuade or convince others, convey valuable ideas to others, practice ideas, and ready to accept feedback from others (Sternberg, 2003).

Creative thinking skills can be developed through synectic models strategies. Synectic models developed by William J. Gordon. Joyce, Weil, and Calhoun (1996; 2009) suggest that synectic model is a learning strategy that invites students to create the imagery and metaphors of the concepts learned. In line with these opinions, Meador (1994) stated that the synectic model provides the opportunity for individuals to connect abstract concepts into concrete concepts.

Synectic model has two strategies that are: making it familiar to be new or unfamiliar (creating something new) and making foreign things become familiar (making the strange familiar). Synectic models strategy chosen to develop creative thinking of students is the strategy of creating something new. Students are invited to create a new and unique definition in understanding the counseling concepts being studied. Creation of definition not only for understanding the concept, but students directly applies the new definition in the activities of individual counseling practice.

The new definition is used to formulate new questions in extracting counselee data. Strategies stages creating something new synectic models are: (1) describe the current situation,]the professor asks students to describe situations or topics as they see today, (2) direct analogy I namely student proposes direct analogy, selecting, and exploring the parable , (3) the personal analogy that students use analogies that have been chosen, (4) dense conflict, students take the description of the second and third stages to make two words that contradict each other, (5) direct analogy II, students make direct analogy based on the outcome of the solid conflict analogy, and (6) to reexamine its initial task, the lecturer asks the students back on the previous task and describe new definition.

Starting from a low ability of creative thinking of students in conducting practice of counseling, through Class Action Research (PTK) aims to improve the learning process of individual counseling practicum. The hope, lectures Individual Counseling Practicum with synectic models learning help prospective student as a candidate counselor hone his creative thinking skills.

METHOD

Classroom action research using four steps: planning, implementation, observation, and reflection (Mills, 2007). This study aims to improve learning in Individual Counseling Practicum course. Improvements made to train the candidate counselor in creative thinking skills in the learning process and counseling practice.

Research subjects were students 2014 generation who take a course in Class A Individual Counseling Practicum odd semester in 2016/2017.22 Students, 5 male and 17 female. Based on data collecting, obtained quantitative and qualitative data. Synectic model data obtained from the observations with the lecturers instrument performance in teaching and learning recording journal. While the creative thinking skills data obtained from the Journal of Student Learning Experience (JPBM), Journal of Counseling Practice Experience (JPPK), learning observation sheets, student counseling practice, and creative thinking skills inventory.

Action research procedures along with synectic model steps of learning for 10 meetings. Students are trained to find a new definition of counseling concept being

studied, find a new definition of right and worth, as well as using the new definition into counseling practice to prepare counseling questions. Learning activities ended with peer's reflection activities. It is an indicator of the achievement of the action research to develop creative thinking abilities of students.

Data analysis aims to find the meaning of any data collected during action research. The collected data were analyzed by qualitative and quantitative descriptive. Data were analyzed with qualitative descriptive that is data from the Journal of Student Learning Experience (JPBM) and the Journal of Counseling Practice Experience (JPPK). While data that was analyzed by quantitative descriptive was data obtained from creative thinking skills inventory of prospective counselors. Steps of data analysis in the classroom action research involve three things: (1) data reduction, in this step, activities conducted to select and sort and classify the data according to the research focus, (2) data presentation, exposing data is conducted that is the foundation for researchers to interpret the study, and (3) conclusion, at this stage, portrayal of research findings and data verification is conducted to draw conclusions.

Evaluation and reflection conducted by evaluating the synectic model learning process at the end of the cycle meeting. Discussions were held with students, the results are combined into a research recording journal, which contains the researchers records in conducting learning action. This journal is used to record the weakness of the study and improvement plan in the next cycle.

FINDING AND DISCUSSION

Development exercise of creative thinking skills through synectic models in counseling learning is a unique experience for students and lecturers. This exercise was conducted in two cycles of learning. First cycle lasts five meetings with learning activities and practical approach of Rational Emotive Behavior Therapy (REBT). Cycle II conducted over five meetings with learning activities and reality counseling practice. Both cycles of action research described below.

Meeting-1, mastery the main concepts of REBT approach. The learning process directed so that students find a new definition

of the main concepts of REBT by finding the right metaphor to describe the concept.

The 2ⁿᵈ meeting, students practiced REBT with thought stopping technique. Learning began with the mastery of a new definition of thought stopping technique. The new definitions used by students to formulate vary questions in counseling practice. Class concluded with an evaluation from the researchers about the creative thinking skills of students and deployment of creative thinking skills inventory as a pretest.

The 3ʳᵈ Meeting, researchers conducted a counseling practice activities reflection in the 2nd meeting. At this meeting, students did practice REBT with thought stopping technique. Researchers started the study by finding a new definition of thought stopping technique. Students brought the new definition in doing counseling practice. Students were still having difficulties to find a new definition and raise a new definition in counseling questions.

The 4ᵗʰ meeting, researchers conducted a reflection of counseling practice activities in 3rd meeting. The students experience in learning is to find a new definition of thought stopping and using the new definition in formulating counseling questions. Students were begun skillfully in making parable, find a new definition, and bring new definition in counseling practice. A reflection activity with new colleagues performed by several pairs of students.

The 5ᵗʰ meeting, students performed simulations of REBT. Simulation of 3 students showed that creative thinking skills of students experiencing were grown. Students were able to formulate varies counseling questions based on the new definition found in the meeting 1, 2, 3, and 4. At the end of the meeting, researchers conducted an evaluation of the development of students' creative thinking skills. Class concluded by giving a motivation to students to develop creative thinking skills and creative thinking skills inventory deployment as a posttest.

The 6ᵗʰ meeting, mastery concept of reality approach. Researchers asked students to formulate new definition of the main concepts of reality. Students used a metaphor to describe the concept of reality.

The 7ᵗʰ meeting, students conducted reality counseling practice with confrontation techniques. Students initiated practice activities by understanding the concepts confrontation techniques by finding a new

definition. That definition, brought into counseling practice, especially to help formulate counseling questions creatively. Class concluded with peers reflections, research evaluation, and dissemination of creative thinking skills inventory.

The 8th meeting, the students conducted counseling practice of reality using the confrontation techniques. Researchers began learning activities with a new definition invention of the humor technique. Students using new definition into counseling practice. Counseling practice concluded with peers reflections, research evaluation, as well as the encouragement to develop students' creative thinking skills in counseling practice.

The 9th meeting, researchers conducted an evaluation of the creative thinking skills of students in practice at the 8th meeting. At this meeting, students learned to define the verbal shock techniques with new definition. Students generated varied counseling questions based on new definitions found. Counseling practice concluded with peers reflections, research evaluation, as well as the encouragement to develop students' creative thinking skills in counseling practice.

The 10th meeting, researchers conducted an evaluation of counseling practice at the 9th meeting. At this meeting, three students simulated Reality counseling. Students skilled in raising questions that vary based on new definition possessed during counseling practice. Class concluded with researchers evaluation and creative thinking skills inventory deployment as a posttest.

Reflection was conducted at the end of the cycle. Reflection cycle I found the following: (1) time to convey the concept of counseling were too long, so the time to do counseling practice were reduced, (2) formation of parable dominated by researchers and students tend to be passive, (3) researchers analogy treasury were still low, (4) the development of creative thinking skills of students could not be known directly by the researchers. Reflection of the second cycle was found the following: (1) learning with synectic model on cycle II ran smoothly. The sixth step of synectic learning were done optimally, (2) the development of creative thinking skills of students was done thoroughly. Completeness could be seen from the number of new definitions were raised, especially when counseling practice were conducted, (3) peers reflection activity had been conducted by students at the end of the counseling practice well.

Based on the process cycle I and II research found the following: (1) creative thinking skills of students had increased by synectic learning could be seen from the pretest and posttest scores of each cycles. In the first cycle known that students creative thinking skills score was 9% in the category 'low', 59% category 'medium', and 32% category of' high '. While scores of creative thinking skills of students in the second cycle, 23% category of 'medium' and 77% category of 'high', (2) students were weeks enthusiastic to find parables, (3) synectic learning model with a six-step ran smoothly. Problems were found at the stage of solid conflict, (4) students enthusiastic to immediately conduct counseling practice and reflection together with peers. Here is a picture graph of creative thinking skills of students based on the results of pretest and posttest in two cycles.
Figure 1. Pretest and Posttest Scores First Cycle

Based on the graph above, it can be seen that the learning cycle I, the average students pretest score was 7.68 (45.17%) and posttest score was 9.95 (58.58%). The results of the pretest and posttest was found that creative thinking skills of students increased by 13.41%. In other words, creative thinking skills of students in the first cycle in the category "sufficient".
Figure 2. Pretest dan Posttest Score Second Cycle

The average students pretest score in the second cycle was 12.45 (65.53%) and students posttest scores at 14.18 (74.63%). Pretest and posttest results known that the change of percentage score by a margin of 9.1%. In other words, creative thinking skills of students in the second cycle, is in the "good" category.

Based on the three forms of skills in creative thinking, students have achieved mastery in synectic and analytical thinking skills. Practical skill only possessed by a few students. This action research gives varies results for the development of students creative thinking skills in both the learning and counseling practice.

The results of actions research strengthened from activities of counseling practice exam. Collecting data on the counseling practice exam obtained consistent results with the analysis as the result of pretest and posttest, and the analysis of the development of students creative thinking skills at every meeting as well. 5 students had been found who do not have the skills to think creatively and 17 students who already have the skills of creative thinking in the counseling practice.

The success of learning is influenced by several factors, so the success of this action research synectic models. A number of factors play a role in the success of which is the activity of students as one of the keys to success in learning synectic. Walker (2009) states that synectic learning process based on the student's imagination. Students imagination used to see the natural phenomenon from a different angle. Finding Tsai (2012) also mentioned that imagination becomes the means to do creative activities.

Synectic learning model has six interrelated phases. The linkage of each phase helps students to transfer parable descriptions into theoretical concepts learned. Eragamreddy (2013) mentions that the ideas derived from synectic activities in one context will be transferred to other contexts to find relationship, understanding, views or fresh perspective from the concepts learned.

Environment make students think creatively is something that must be done (Tsai, 2013). Lecturer designs learning situations that can encourage students to be active and think (Afshari and Ghaemi, 2014). Lecturer really focuses on students during the learning process (Forrester, 2008). Finding Tsai (2014); Meintjes and Grosser (2010) also illustrate that lecturer play an important

role in enhancing the creative thinking skills of students.

Giving motivation to students to develop creative thinking skills in understanding the concept and counseling practice needs to be conducted at each meeting. Fatemipour and Kordnaeej (2014) states that educators should encourage learners during the learning process. Patience is one of the factors in the synectic learning. Lecturer really guide and direct students to explore creative ideas.

Synectic learning provides facilities for students to learn on their own way. Students apply knowledge, especially knowledge in daily life into the material being studied (Yousefi, 2014). Walker (2009) states that the synectic model invites students to see nature, objects, the process of formation of an event or activity into parables in understanding the concepts being studied. Walker (2009); Vani M (2012) found that the synectic model helps students to think freely and creatively. Further, Mustami'sfindings (2007) explains that the synectic model can influence the creative thinking skills of learners.

CONCLUSION

Synectic model application in counseling learning helps students to improve their creative thinking skills in the learning and counseling practice. This action research shows that creative thinking skills that students achieved is synthetic and analytic skills. Only a few students acquired achievement of the practical skills. Successful or not, this practice of creative thinking skills cannot be separated from the influence of external factors both lecturers and students of the prospective counselor.

The results of this study are not only used as a reference for the lecturer of learning counseling course, but also for other lecturers of other subjects in the Department of Guidance and Counseling. Synectic learning is a media to conduct active learning. Lecturer becomes facilitators for students to directly involved in the learning process. The involvement of students in the learning process can be a contributing factor to the achievement of competence of graduates, one of them is creative thinking skills.

The results of this study can be a reference for further research. Further researchers can improve learning action, particularly on the achievement of students

practical thinking skills. Researchers conduct innovation in learning to stimulate the emergence of third students thinking skills at the maximum level. Researchers can make the results of this study as the development of research activities by applying the synectic learning model in other academic subjects and comparing the effectiveness of synectic model with experiential learning models for the development of creative thinking skills prospective counselors.

DEVELOPING THE CAPABILITIES OF THE LOGIC OF INQUIRY STUDENT TEACHERS IN THE FIELD OF RESEARCH THROUGH THE INTEGRATED LEARNING MODEL OF SHARED BASED GALLERY PROJECT

Nurul Ulfatin; Amat Mukhadis
State University of Malang
Email: nurul.ulfatin.fip@um.ac.id

ABSTRACT

This study aimed to test the significance of integrated learning model of shared-based gallery project (ILS-based GP) in developing the capabilities of the logic of inquiry student teachers in the field of research. The design of the study is a quasi experimental. The research sample consisted of 339 students teachers by taken assignment random sampling. The experimental data were collected by the objective and subjective tests and analyzed by t-test. The results showed that the integrated learning model of shared-based gallery project (ILS-based GP) is more effective in developing the capabilities of the logic of inquiry student teachers in the field of research rather than conventional learning model which has been carried out.

Keywords: *integrated learning, shared model based gallery project, the logic of inquiry capabilities, student teachers*

The logic of inquiry capabilities student teachers in the field of research is still low (Mukhadis and Ulfatin, 2014a; 2014b; and 2015; FGD UM, 2013). It is characterized by lack mastery of the logically certain and empirically accurate in the field of research. Capability of the logic of inquiry and empirical testing as a prerequisite reach meaningful understanding in the field of research (Soewardi, 2000). Representation of the logic of inquiry which covers the identification of the problem, determine the theoretical framework, and the formulation of a hypothesis as hierakhis procedure. While empirical testing is a representation operationalization of research variables, instrument development, data collect-ion and analysis, hypothesis testing and interpretation of research results. Representation of empirically accurate capabilities of students in the field of research requires thoroughness significantly mastery the logic of inquiry. Even the relationship between the two according to Cheetham and Chivers (in Le Deist and Winterton, 2005); and Posner & Keele (in Westera, 2001), it is hierarchical between the know-that and the know-how knowledge. As for Wang, (2007) calls their relationship more as a prerequisite relationships. This means that before teahers students can master the significantly of the empirically accurate in the field of research should be thoroughly mastered of the logically certain.

Based on empirical data and opinions on the above, it is necessary learning alernatif able to develop the capabilities of the logic of inquiry significantly for student teachers. The results of theoretical and empirical studies on relevance alternative learning, namely integrated learning model of shared-based gallery project (ILS-based GP). This alternative is based on theoretical and empirical support. The theoretical grounding is used, among others: content treatment interactions (CTI) and apptitude treatment interaction (ATI) approaches (Jonassen, 1982); development of neuroscience, particularly cognitive neuroscience (Pasiak, 2006; Jensen, 2007; and Bradberry and Greaves, 2007); teaching strategies (Regeluth & Merill, 1984); integrated thematic interaction, ITI (Kovalik, 1994); and integrated curricula (Fogarty, 1993). The foundation of empirical research used Cooper, Orrel, and Bowden (2010); Emslie (2012); Bellanca, Chapman, and Swartz (1997); Johnson and Johnson (2002); Arends (2004); Yuliati (2007); Fajar (2005) and Fogarty (1993), which concluded that the work integrated learning (WIL) is superior model than of learning separated model in increasing mastery academic, skills, and the appaeling of the student. In addition, Mukhadis and Ulfatin (2014b), concluded that the integrated learning model in higher education is more effective in improving the

quality of learning outcomes and the appaeling of the research methodology.

The alternative learning model strength lies in the arrangement of the contents mode, learning mode and learning syntax. First, the mode of arrangement of the essential contents of overlapping between concepts, principles and procedures performed with a shared model of which is based on the theory of CTI (Jonassen, 1982; Fogarty, 1993; Fogerty, 1997). Second, the learning mode in the form of gallery project been based on the theory of ATI (Jonassen, 1982). Integrated learning model of shared-based gallery project is a synergy paradigm of thinking CTI and ATI. Third, learning more nuanced syntax students centered oriented, and puts the class as learning centers (Koehler et al. 2011; Silberman, 1996; Joyce & Weil, 1982; Abduhzen, 2013).

METHOD

Efforts to produce a prototype integrated learning model of shared-based gallery project following the modification of the developed procedure by Borg and Gall (1992); Gall, Gall, & Borg (2003); Richey and Klein (2007); and Mukhadis & Ulfatin (2013). Experimental with pretest-posttest control group design to test alternative learning model of excellence in developing the capabilities of the logic of inquiry student teachers in the field of research. These samples included 339 students (departement of mathematics, engineering, accounting, indonesian language education and education administration) established by assignment random sampling of public and private education and`traning institutions (LPTK). Data were collected by objective and subjective test and the validity and reliability of the test = 0.52, and = 0.426. Data were analyzed by t-test.

FINDING AND DISCUSSION
Entry Behavior Capability of the Logic of Inquiry Student Teachers

Entry behavior's students test in the capability of the logic of inquiry in the field of research to confirm the presence of this variable, not contaminate the dependent variables were observed. Controlling the entry behavior capabilities of the logic of inquiry in the field of research were conducted by the t-test (Siegel, 1956). Results of capabilities different test of the logic of inquiry in the field of research

between the experimental and the control group in the whole sample.

Based on the difference significance test of entry behavior capabilities of the logic of inquiry between experimental and control group there was no difference. Thus for data analysis to test the significance of differences in the students capabilities of the logic of inquiry in the field of research in the form of combined results of the objective and the subjective tests.

Capability of the Logic of inquiry in the field of research Student Teachers

Before testing the significance of differences between the experimental group and the control group, the requirements test for normality and homogeneity of data. Test of the significance of difference capabilities development the logic of inquiry student teachers in the field of research between the experimental and control groups based on the mean score of the combined objective and subjective test by t-test. The data shows the t-test = 3.562, with significance = 0.000> 0.05. These results can be interpreted that there is a difference between test scores (a combination of objective and subjective test) between the experimental and the control group. That is, the development of the logic of inquiry capabilities student teachers in the field of research is more effective the integrated learning model of shared-based gallery project (ILS based GP).

Interpretation of these results can be explained by two main mindset, the mindset of learning model, and the characteristics of the field of learning. First, the mindset of the integrated learning model of shared-based gallery project (ILS based GP) based on the synergy of the theory of content organizing (CTI) and individual differences (ATI) on Jonassen (1982). Organizing of the content esensial that is overlapping, and mode of learning (Bloom in the Keefe, 1987; and Sugden, 1989) which is based on individual differences. By learning to accommodate the arrangement of content and diversity learning mode, has a synergistic effect to (1) a holistic, student-oriented, process-oriented, learning experiences meaningful, authentic and active learning, and evaluation of processes and products (Fogarty, 1993; Kumar, et al., 2008); (2) maximize the use of the learning resources, by design and by utilizations learning resource; (3) improving the understanding and meaningful experience for students (Joni, 1996; Silberman, 1996);

(3) to facilitate the development of the mindset of how to solve the problem is not the mindset of how create the new problem (Nuh, 2014). In addition, with a variety of modes and ways of learning setrategi according Kasali (2012) can be changed the culture of the generation of lazy thinking of being able and accustomed to reasoning, and put 'class as learning centers'. The theoretical and empirical support of this model in improving the meaningfulness of learning in line with the results of studies by Cooper, Orrel, and Bowden (2010); Van Rooijen (2012); Arends (2004); Fajar (2005); Bellanca, Chapman, and Swartz (1997); Johnson and Johnson (2002); Mukhadis & Ulfatin, (2015).

Second, the mindset characteristic of learning, the research methodology courses that especially purpose to facilitate the development of the logic of inquiry student teachers (UM Rector Regulations, No. 17/2014). The logic of inquiry student teachers represents a rational way of thinking-theoretic logical and reasonable, reinforced with logical thinking based on empirical observations. Capability of the logic of inquiry student teachers, specialized in the field of research according to Hanafin (2014); and Soewardi (2000), a requirement in building logic is mathematical certainty. While empirically accurate is a requirement in establishing the accuracy observations and measurements accurately. Both characteristics are required this is the basis for making the justification of correspondence between the conceptual's world and the world of empirical (Balian in Salladien, 1997). The logic of inquiry in the context of procurement in the field of research methodology the stages in an effort to uncover the behavior of empirical, both in the universe as well as on human behavior in the world.

CONCLUSION

Based on the interpretation and discussion of the data analysis results can be drawn the conclusion that the integrated learning model of shared-based gallery project (ILS based GP) more effevtive in developing the capabilities of the logic of inquiry student teachers in the field of research than convetional learning model which has been carried out. In recomendation, especially the lecturers in the research methodology course to try out and further develop of integrated learning model

of shared-based gallery project (ILS based GP) in improving the quality of process and learning outcomes in a sustainable manner. Primarily, in developing the capabilities of the logic of inquiry of student teachers in the field of research.

IMAGES OF EDUCATIONAL IMPLEMENTATION AT VOCATIONAL HIGH SCHOOL (SMK) BASED ISLAMIC BOARDING SCHOOL IN TRENGGALEK

Pungki Widi Utomo
State University of Malang
Email: pungki91@gmail.com

ABSTRACT

Vocational school is one of education implementer which teaches special skill to students. Vocational school can be managed by either government or private party. Islamic boarding school is one of private foundations which often implement the management of Vocational High School (SMK). Vocational education program based Islamic boarding school has offered a various good program for the society. SMK based on Islamic boarding school will give collaboration between general vocational learning and religion learning. The general vocational learning is useful in forming the students hard skill while the religion learning is useful to give soft skill and to form the students' characteristic. It is no doubt that Islamic boarding school is one of community institutions which has big rule in forming the character of nation. Nowadays, the existence of SMK which is managed by the private foundation in Trenggalek has undergone many problems. It is affected for SMK based Islamic Boarding school. Therefore, it is use doing the study about the condition of education implementation in SMK based Islamic Boarding School which is seen from eight Education National Standards (SNP) in Indonesia. Those are discussed in this study. They are: Graduation Competency Standard, Standard of Content, Standard of Process, Teachers and Educational Personnel Standard, Facilities and Infrastructure Standard, Management Standard, Standard of Education Finance, Standard of Educational Assessment. Data resources from this study are the writer himself, three informants, and from various references. Data collection activity is done by a deep observation method and documentations. It is hoped that the study of implementation vocational school based Islamic Boarding School can give some benefits to complete some problem in management of private vocational school and SMK based Islamic Boarding School in Trenggalek and as the reference for development of vocational education in Indonesia.

Key Word: *images, vocational high school, islamic boarding school*

The needs of skilled labors and those who have well soft skill are needed to fulfill the demands in the industry world. Vocational High School is one of educational programme which releases the skilled labors in operator level. The implementation of Vocational High School can be implemented in an Islamic Boarding School environment. SMK which is under Islamic Boarding School is a formal education in which the students are able to get the facilities of learning general science.

Malik (2005) defined that an Islamic Boarding School is one a traditional Islamic Educational Institution to learn, understand, deepen, live and practice Islamic scienceby focusing on the importance of religiuos moral as daily guidance of behaviour. Education institution can be called as Islamic Boarding School if it has some elements. According to Masjkur (2007) there are five basic elements which is a system from Islamic Boarding School, those are : (1) Boarding School is as a dormitory for the students to gather and study under Kyai's guidance; (2) Mosque, it is an important element in the Islamic Boarding School, because it is the central of education implementation under Kyai's guidance; (3) Teaching classic books or Kitab Kuning. The classic books taught there generally can be classified to be eights. They are Nahwu and Sharaf, fiqh, ushul fiqh, Hadist, tafsir, tauhid, tasawuf and other branches, such as tarikh, balaghah etc; (4) Santri. Those are the students who seriously deepen to learn a religuos science (theology) there, they either stay there or go home after school time; (5) Kyai. Kyai is a leader of Islamic Boarding school who is a very essential element for it.

As developing era, Islamic Boarding School has to keep its existence by vtrious ways. The ways done by Islamic Boarding School in Trenggalek is by forming a Vocational High school (SMK) based Islamic Boarding School. It is a good idea. Because, it is not only to keep its existence but also to be able to add the students' skill there to be able to face the challenge of changing and development of era. According to Suharto (2015) Islamic Boarding School will be able to face the challenge of era because its existance in every changing of era can be proved.

Vocational High School (SMK) is one of forms of formal education unit which carries vocational educationin the secondary education level as an advance from Junir High School (SMP), MTs or other equal level. School in education level and kinds of vocation can be named Vocational High school (SMK) or Vocational Islamic School (MAK), or other equal level (UU Sisdiknas No. 20 Th. 2003). Then, the purpose of Vocatinal High Scool according to Undang-undang Nomor 20 tahun 2003is devided to be general and special purpose. The general purpose of Vocational High School are: (a) To increase the faith and devotion of the students onto the gods; (b) To develop the students' potential in order to be citizen whose character is good, healthy, educated, skilled, creative, independent, democratic, and responsible; (c) To develop the students potential in order to have nationality view, understand and appreciate the diversity of Indonesian culture; and (d) To develop the students' potential in order to concern with the living environment, actively maintain and conserve it, and also use the natural resources effectively and efficiently.

The special purpose of Vocational High School as follow: (a) To prepare the students in order to be productive human, be able to work alone, fill the job vacancy as the secondary level labors which is suitable with the competence in their choosen programme; (b) To prepare the students to choose their careers, be diligent and presistent in the competition, adabt in the work environment and develop professional attitude in the competence they are interested in; (c) To supply the students with the science, technology and art in order to develop themselves someday either independently or by higher education.; and (d) to supply the students with the competence which is suitable with the programme they choose.

In implementing Vocational High School, it cannot be separated with Peraturan Pemerintah Republik Indonesia Nomr 32 Tahun 2013 Pasal 2 Ayat 1 which manages National Education Standard, namely: (1) Content standard is a criteria of all materials competence level to reach graduation competence in certain level and kinds of education, which is writen in the criteria about graduation competence, study materials, subject competence and syllabus of learning; (2) Process standard is a criteria of learning implementation in an education to achieve the graduation competence standard;

(3) Graduation Competence standard (SKL) is a criteria of qualification of graduation competence including cognitive, affective and psikomor; (4) Teacher and Education Personnel standard is a criteria of pra position education and the appropriateness or mental, and also education in position. The teacher mustt have qualification of academic and competence as learning agent, healthy inside and outside, and also has competence to bring national education in reality. Academic qualification is a minimal education level which the teacher has to pass by being proven by a diplomaand/or a relevant certificate based on the used legislation; (5) Facilities and Infrastructures standard is a criteria of study room, sport place, worship place, library, laboratorium, workshop, play ground, recreation place and having recreation and other study sources whch are needed to support learning process including the use of information and communication technology; (6) Management standard is a criteria of Planning, implementing ad supervising education activity in the education unit, regency/city, province, or national in order to reach the efficience and effectiveness of education implementation; (7) Financial Standard is a criteria of the component and the amount educational operation cost during a year; (8) assessment Standard is a criteria of machanism, procedure, the students' instrument of learning outcome assessment. This assessment is based on the assessment principle, such as: valid, objective, integrated, opened, comprehensive and sustainable, systematic, referenced of criteria and accountable.

DISCUSSION
Analysing the implementation of Education National Standard in SMK based Islamic Boarding School

The implementation standard of vocation education done in one of SMK based Islamic Boarding School in Trenggalek can be described as follow: in the subject taught to SMK students has been suitable with standard, but there are some subjects or contents which becomes local content from that Islamic boarding school. The local content becomes additional value from education in SMK based on Islamic boarding school. Every material of local content is religion subject which will be able to add the students' comprehension in religion. Besides that, religion science (theology) becomes

local content as the framer of good character which every educational process wants to reach.

I terms of process standard, the implementation of learning has been well. The learning is implemented by orderly schedule based on the guide of learning implementation. Next, Graduation Competence Standard reached by SMK students based Islamic Boarding school is still low. It is caused by some aspects. One of the most influenced aspects in reaching SKL is the students' competence influenced by the social economy background.

In teachers and education personnel standard, there are still some problems. One of the most crucial problem is lack of teacher, espeially in C-grouped subject interest). It can be finished by assigning a general teacher who has technical capability and masters C-grouped subject (interest). Education personnel who works at SMK still needs to increase his competence.

About facilities and infrastructures in SMK based on Islamic Boarding School is generally already good. It is shown by being fulfiled learning activity i the classroom. But in increasing the students' competence i C-grouped subjects (interest), there are many facilities and infrastructures needs to be complete. Management Standard in SMK based on Islamic Boarding school is already well. It is supported by management which is centered in the foundation and directly supervised by the leader of foundation.

The finance of implementing education in SMK based on Islamic Boarding school is from the government assist, foundation, and the finance from the students. In the financial management, it is neede to be increased. There are many management units which is not maximal yet. The last standard which can be described from Boarding School is Assessment Standard. The assessment used in SMK is good. In implementing assessment, it has not used the good guidance yet, so that there are many things which shuld be prepared in assessment standard.

The Weakness and the Strengh of SMK based Islamic Boarding School

Reviewing the analysis from education standard, there are many weakness in SMK based Islamic Boarding School. On the other side, there are many strengh from it. According to Sulthon and Khusnuridlo (2006) there are some things which will be created from Islamic Boarding School

condition, namely: (a) There is a close relation among students and Kyai. Kyai pays attention very much to his students; (b) the students' obedience to Kyai . The students think that disobeying the Kyai is not only implite but it is also forbidden by religion; (c) economical and simple life is really shown in boarding school environment; (d) the independence is really felt in boarding school. The students wash their clothes , clean the bedroom, and cook by themselves; (e) mutual assistance and brotherhood situation color the socialisation in the boarding school; (f) discpline is wished to keep the discipline in boarding school by giving educative punishments; (g) the life in the high religius level, brave to suffer for reaching the purpose.

Those conditions are very good to form the high character of SMK graduation. The learning process of SMK based on Islamic boarding School will be very effective in forming the students' characters, because Islamic boarding School has moral value, religius things, togetherness etc (Suharto, 2015).

CONCLUSION

Vocational High School based on Islamic Boarding school will exist although it is colored by a various problems. It is needed the management of well problem solving to overcome the problem which appears from intern management of that SMK. Besides thet, education in SMK based on Boarding Islamic School is one of the answers about the character crisis which happens in Indonesia education.

IMPRESSIONS OF STUDENT AND TEACHER IN BLENDED LEARNING

Puri Selfi Cholifah
Lembaga: …………
Email: cholifah.ps@gmail.com

ABSTRACT

Education as an important and integral part of the technology has contributed to the dynamics of learning as a tool of accommodating the needs of students who can be regarded as the digital generation. The using of blended learning is able to answer the challenges of today's digital era. The purpose of the analysis performed in this study is to identify the positive and negative impressions that faced by teachers and students in blended learning. This finding of the analysis revealed that teacher and student felt optimistic and had positive thoughts about blended learning. Furthermore, there were also some evidences that blended learning gave significant effect towards the performance of student achievement. The negative impressions that appeared were waste of time and lack of internet connection. The review also discovered the some recommendations to minimalize those issues.

Keywords: blended learning, teacher's impression,s student's impressions

Education as one important and inseparable part with technology plays a vital role in dynamics of current learning process. The correlation is described in an integration terms in the education system. Integration between technology and learning content is belief to be able to increase students' achievement (Hamilton, 2007). Further, integration of technology that is information and communication technology (ICT) playing the most vital role in increasing education quality through learning (Summak (2010); Shadreck (2015), to optimize 21st century skill gain which is known as 4C (critical thinking, communication, collaboration, and creativity). Those skills include: (1) collaboration and communication; (2) creativity and innovation; (3) critical thinking; and (4) digital society (Stubbs, 2011).

Successful integration of technology in education related to skills in the digital society becomes a critical issue. Advances in technology, especially Internet commonly triggers an increase in the use of media and interactive simulations in online learning (Kim & Bonk, 2006). Online learning is one form of integration of digital technologies in learning that enables students to familiarize themselves to study anywhere, anytime, and with anyone. The changes are becoming challenge for teachers to be able to accommodate the needs of students today and in the future in relation to the changing landscape of digital learning (Hardy & Jefferies, 2010). Turel (2014) suggests that

the underlying success of integrated technology teaching in elementary and secondary education is entirely in the hands of teachers.

In this regard, it is important to accommodate the needs of students in terms of future learning and coherence of the teacher as the main indicator of the successful integration of technology in learning. The solution is an alternative of the above challenges by implementing blended learning which combines online, offline, and face to face learning. Graham (2004) suggested that blended learning was once a blend of traditional face-to-face learning and distributed learning system (online). Blended learning is firstly triggered by the need of face to face learning not found in online learning. Blended learning does not eliminate the teacher face to face and not grounded in efforts to reduce costs as well as online learning (Means, et al, 2013).

The popularity of blended learning allows many studies which are conducted related to it in various fields of study, levels, and institutions. Some studies reveal the advantage of learning by using blended learning related to an increase in the achievement of learners (Kazu & Demirkol, 2014; Abdelrahem, 2014; Akgunduz & Akinoglu, 2016; Yaghmour, 2016). The implementation of blended learning in learning does not only cause a positive impression of the advantage gained because several studies have shown a negative tone in their implementation. This article aims at

reviewing the impression arising from learning blended learning in educational institutions both positive and negative. Specifically, a review of these studies is focused on the opinions of teachers and students in the implementation of the key factors related to blended learning.

Blended learning is itself is not a brandnew concept in the world of education. Many opinions reveal different definitions related to the term blended learning in terms of media, learning, or media (Driscoll, 2002). "Blended learning focuses on optimizing achievement of learning objectives by applying the" right "learning technologies to match the" right "personal learning style to transfer the" right "skills to the" right "person at the" right "time" (sighn & Reed, 2001). In such cases, the accuracy of all aspects of learning becomes central to the implementation of the blended learning. Furthermore, the term blended learning associated with the context of this article refers to the blending definition based on learning activities that include face to face learning, direct e-learning, and self-pace learning (Signh, 2003). Based on this, the definition of blended learning can be translated into learning that blends traditional face-to-face learning, online learning, and offline learning.

Dwiyogo (2014) revealed that the main goal of blended learning is giving students chance to learn independently, sustainably, resulting in learning that lasts a lifetime. Blended learning as the goal to achieve lasts a lifetime which is indicated as a learning which takes place continuously. Along with the more advancement of technology, the possibility of learning is more eliminating the 'wall' of school. Students can study anywhere, anytime, and from any source.

Blended learning is not only comes as an alternative learning. Sighn (2001) has revealed several advantages of blended learning they are to improve the effectiveness of learning, extend the range of learning, optimize yield, cost, and time in learning. This is certainly related to the needs and characteristics of learners who use blended learning. Therefore, Graham (2009) reveals the urgency to understand and comprehend blended learning that occurs at various levels, including institutional level, program level, subject level, and activity one.

METHOD

This study was conducted by a systematic review of 25 studies results related to blended learning impression especially students and teachers. An intensive search was conducted on the database of ERIC journal, Elsiever, and Google Scholar with categories of open access electronic journal. The time span in which the studies reviewed was publications from 2006 to 2016. The keywords used are related to "blended learning," "student" and "teacher," either in the title or keywords in the article. Several requirements to include article as part of the analysis, namely (1) the journal should be considered as a research involving participants so that research forms a meta-synthesis, meta-analysis and review of literature excluded, (2) the journal is presented in English, and (3) the journal contains the concept of blended learning.

FINDING AND DISCUSSION
Data Presentation

The final results obtained in this analysis are 25 articles from various journals. There are 3 articles derived from the database of Elsiever that included in Internet and Higher Education journal. There is only one article which selected from Google Scholar database that is journal entitled Educational Technology & Society. Through the database of ERIC, the journal found are: Journal of Open, Flexible, and Distance Learning 1 article, European Journal of Contemporary Education with 1 article, Canadian Journal of Higher Education (CJHE) with 1 article, Turkish Online Journal of Distance Education (TOJDE) with 2 articles, The International Review of Research in Open and Distance Learning (IRRODL) with 1 article, Acta Didactica Napocensia with 1 article, International Journal of Advancement in Education and Social Sciences (IJAESS) with 1 article, International Journal of Education and Development using Information and Communication Technology (IJEDICT) with 1 article, The Electronic Journal of e-Learning (EJEL) with 4 articles, Journal of International Education Research with 1 article, Universal Journal of Educational Research with 1 article, English Language Teaching with 3 articles, The Turkish Online Journal of Educational Technology (TOJET) with 1 article, Journal of Asynchronous Learning Networks with 1 article, and Research in Learning Technology

with 1 article. In summary, the summary of characteristics of the studies reviewed are presented in table.1

Table 1. summary of characteristics of the studies included in the review

Based on Table 1, data showed that there is a research setting, in this case the country of origin research both developed and developing countries, among others are in Australia, Canada, Cezh Republic, Ghana, Malaysia, New Zealand, Saudi Arabia, South Africa, South Korea, Taiwan, Thailand, Turkey, Uganda, United Kingdom, and USA. A total of five studies (20%) was conducted in Turkey, 3 studies in Saudi Arabia (12%). The research conducted in Australia, Malaysia, United Kingdom, and the United States was respectively 2 studies (8%). Based on educational institutions, from table of data obtained a total of 18 studies (72%) at university level, followed by four studies (16%) performed at the high school level, two studies in junior high school, and only 1 study at primary school level. The range of participants totaling at least 12 participants from the high school level with qualitative research conducted by Challob, Fuel, & Latif (2016). The highest number of participants is contained in a quantitative study by Kintu and Zhu (2016) by the number of study participants as many as 270 people.

Positive impression of student on blended learning

In general, the results of study reveal some things that fall into category of a positive impression of students blended learning. First is the increased flexibility for students to learn. The use of blended learning provides a positive impression as learning becomes more flexible for students (Zaka, 2013; Yapici & Akbayin, 2012; Akkoyunlu, Meryem, & Soyl 2011; Erdem & Kibar, 2014 Napier, Dekhane, & Smith, 2011; Challob, fuel, & Latif, 2016). Furthermore, Zaka (2013), Yapici & Akbayin (2012) reported that students can have more flexibility in choosing desired learning in accordance with their abilities and interests. The use of simple, flexible time and place became an important point related to flexibility in learning (Chen & Yao, 2016; Challob, Fuel, & Latif, 2016; Erdem & Kibar, 2014).

Secondly, it might increase opportunities for students in independent study (Zaka, 2013; Chang, et al., 2014; Yapici & Akbayin, 2012; Gyamfi & Gyaase, 2015; Banditvilai, 2016; Ja'ashan, 2015; Napier, Dekhane, & Smith, 2011 ;). Students can make review of learning repeatedly (Chang, et al., 2014), students have the opportunity to revise the tasks anytime and anywhere, the availability of quizzes in

blended learning online program, as well as the materials provided in online learning makes students feel better prepared for learning and increasing independence in learning (Yapici & Akbayin, 2012). Data revealed by Gyamfi & Gyaase (2015) showed that students are constantly logging in and checking tasks which are provided on web. Ja'ashan (2015) revealed that blended leaning improve student's responsibility for themself in learning.

Third, it improves performance and achievement of student (Al-Madani, 2015; Banditvilai, 2016; Challob, Fuel, & Latif, 2016; Dinning, et al., 2015; Francescucci & Foster; 2013; Gyamfi & Gyaase; 2015; Ja'ashan, 2015; Yalavaç & Samur, 2016; Yapici & Akbayin; 2012). Such capabilities can increase along with the increase of competence and cognitive skills of students as stated by Chang, et al. (2014), and also may increase ICT literacy of students as stated by Zaka (2013).

Fourth, blended learning is able to motivate students in learning (Zaka, 2013; Dinning, et al., 2015; Francescucci & Foster, 2013; Yapici & Akbayin, 2012; Černá, 2009; Yasumoto, 2014; Banditvilai, 2016;). Further, Francescucci & Foster (2013) revealed data that the interest and attention of students towards learning increases with the use of blended learning. Yapici & Akbayin (2012) also revealed that with the support of online learning with interesting web is able to motivate students. It is also because students are getting new information (Černá, 2009). Kintu and Zhu (2016) also revealed that students are happy to post something and tasks in Moodle.

Fifth, by using blended learning, students feel an increase of peer relationship (Zaka, 2013; Yalavaç & Samur, 2016; Chang, et al., 2014; Černá, 2009; Gyamfi & Gyaase, 2015; Ja'ashan; 2015; Napier, Dekhane , & Smith, 2011; Challob, Fuel, & Latif, 2016; Lee & Bonk, 2016). Furthermore, Chang, et al. (2014) stated that by using blended learning, it is easier for students to discuss learning materials. Gyamfi & Gyaase (2015) and Napier, Dekhane, & Smith (2011) also discloses data on relationship that between students and instructors also increases in the online session.

Negative impression of student on blended learning

In addition to their positive impressions, negative impression also come from students related to learning by using blended learning. Negative impression apparently coming first is an existence of technical constraints related to availability of internet (Zaka, 2013; Yalavaç & Samur, 2016; Yapici & Akbayin, 2012; Gyamfi & Gyaase, 2015). Technical obstacles in the form of full server or server to be down (Gyamfi & Gyaase, 2015), which result in slow data download or play online video (Yapici & Akbayin, 2012).

Secondly, unpreparedness of students in facing learning by using blended learning (Zaka, 2013; Yalavaç & Samur, 2016; Francescucci & Foster, 2013, Dinning, et al., 2015). Furthermore, Francescucci & Foster (2013) found that students find it difficult to respond and participate since they face something new. Dinning, et al. (2015) also found that students feel less confident in their ability of ITC. Furthermore, Yapici & Akbayin (2012) also found disapproval of parents when their children spend their time on internet too often.

The third is the lack of interaction in blended learning (Yalavaç & Samur, 2016; Ja'ashan, 2015). Students tend to be more resilient in making up their opinion of high demand for face to face with a teacher rather than through via Internet. Ja'ashan (2015) found that students tend to feel isolated due to increasing intensity of online interaction. The lack of interaction causes reduction of feedback given to students (Yalavaç & Samur, 2016). Furthermore, the students feel that face to face interaction is more saving time than through online e.g via email (Ja'ashan, 2015).

Fourth, it is found a saturation in implementing learning by using blended learning (Yapici & Akbayin, 2012; Napier, Dekhane, & Smith, 2011;). Students feel bored reading via computer and also felt that quiz content is not in accordance with their interests (Yapici & Akbayin, 2012; Napier, Dekhane, & Smith, 2011).

Positive impression of teacher on blended learning

Based on data obtained from the study of related research results of teachers' impression on blended learning, several findings were found. First, it might improve performance of teachers (Ekici, Kara, and Ekici, 2012; Yalavaç & Samur, 2016; Napier, Dekhane, & Smith, 2011; Benson, Anderson,

& Ooms, 2011). Generally, teachers receive a blended learning as a variation in their learning (Yalavaç & Samur, 2016; Alfahadi, Alsalhi & Alshammari, 2015; Benson, Anderson, & Ooms, 2011;). Moreover, according to Napier, Dekhane, & Smith (2011) blended learning may help to increase innovation in mindset of educators.

Secondly, it is able to improve communication between teachers and students (Yalavaç & Samur, 2016; Alfahadi, Alsalhi & Alshammari, 2015). Furthermore, as reported by Alfahadi, Alsalhi & Alshammari (2015), teachers expressed that blended learning provides an opportunity for students particularly for those who are shy to be able to express their opinions in written form that helps teachers understand their students desire.

Third, it is related to flexibility of learning by using blended learning (Alfahadi, Alsalhi & Alshammari, 2015; Ekici, Kara, and Ekici, 2012; Benson, Anderson, & Ooms, 2011; Tshabalala, Ndereya, & Merwe, 2014). Flexibility of increasing the efficiency and effectiveness of learning is done with ease of access and evaluate learning easily (Ekici, Kara, and Ekici, 2012). Moreover, for a large class, the use of blended learning, enables teachers to access their students (Benson, Anderson, & Ooms, 2011).

Negative impression of teacher on blended learning

In general, implementation of blended learning in learning for teachers does not necessarily give a positive impression overall. There are several things that are categorized as a negative impression of teachers on learning by using blended learning. First, the constraints related to technical matters which become necessary in case a problem is found (Yalavaç & Samur, 2016; Benson, Anderson, & Ooms, 2011; Porter, Graham, Bodily, & Sandberg, 2016). In addition to internet and servers, Benson, Anderson, & Ooms (2011) revealed that the lack of a proper source also might be technical problems in implementing blended learning.

Secondly, teachers are not prepared and have not been accustomed to new things, particularly the implementation of blended learning (Yalavaç & Samur, 2016; Zaka, 2013; Ekici, Kara, and Ekici, 2012). Reluctance to use blended learning is due to lack of mastery of information and communication technology of a teacher

(Zaka, 2013). Furthermore, Ekici, Kara, and Ekici (2012) also stated that the teacher is in doubt about changes of ideas and attitudes related to blended learning.

Third, teachers feel that using blended learning weakens the direct interaction to students by which might result poor manners of learning on Internet (Yalavaç & Samur, 2016; Benson, Anderson, & Ooms, 2011; Porter, Graham, Bodily, & Sandberg, 2016) , Benson, Anderson, & Ooms (2011) also states that there are many teachers who wanted more time to be spent in face to face learning.

Fourth, the negative impression arising related to the time due to the preparation needed in designing learning for blended learning is longer and more difficult (Yalavaç & Samur, 2016; Napier, Dekhane, & Smith, 2011; Benson, Anderson, & Ooms, 2011) , In addition, teachers feel their problems related to providing feedback for students, especially in a group of individuals with a large number of students (Yalavaç & Samur, 2016).

FINDING AND DISCUSSION

In general, the implementation of learning by using blended learning raises impression of students and teachers on both negative and positive one. The objective of this study is to describe their impressions of teachers and students on both positive and negative towards blended learning. a positive impression obtained related to student learning by using blended learning that it is becoming more flexible learning, more independent learning, increasing performance and student achievement, learning becomes more motivating, as well as increasing in peer relationship. Flexibility became one deciding factor in the current study. An element of flexibility that is designed with the involvement of technology supporting access to students and teachers was seen as a major advantage (Creanor & Trinder, 2010). Students can freely, whenever, and wherever access learning resources or their tasks. Dwiyogo (2014) revealed that the main goal of blended learning is that it can provide an opportunity for learners based on their characteristics to be able to access sustainable and lifelong learning so that learning becomes interesting. With increased flexibility, students can be motivated to learn independently in favor of increasing achievement performance and learning outcomes of student.

Positive impression which was described previously is associated with the increase of peer relationships. Yalavaç & Samur (2016) also mention that the probable reasons that make students interested in is that they can communicate with their friends during online learning. Direct interaction sometimes only be mastered by students who are confident or dominating. Blended learning provides an opportunity for students who are shy to discuss face to face (Alfahadi, Alsalhi & Alshammari, 2015), although in a study conducted by Lee and Bonk (2016) it showed that the interaction of peers also depends on quantity and quality performed in their online interaction , This indicates that it is important to provide opportunities for every student to interact positively whether they are positive, they are considered as shy or confident in terms of personal point of view.

Not entirely the students expressed a favorable impression of blended learning. In general, negative impression of students on blended learning is related to technical constraints, unpreparedness students face new thing, the perceived lack of interaction, and their saturation in learning. Technical constraints generally is associated with weakness of internet server or even unavailability of internet at home. Yapici & Akbayin (2012) and Banditvilai (2016) put forward recommendations related to problems in technical terms, namely the importance of affordable Internet access for students and increase the server.

Although in general the students were interested in blended learning, some students just feel more comfortable to keep maintaining a traditional face to face teaching since it is good because students feel less confident, not prepared, or also feel more comfortable interacting directly rather than through online interaction. Creanor & Trinder (2010) revealed that behind the students' self-confidence, a digital literacy good ability is required. In addition, it is important for teachers to maintain or improve the students' motivation by incorporating attractive content in accordance with the needs and interests of students (Yapici & Akbayin, 2012).

As an integral part of learning, teacher plays an important role in blended learning. Based on research studies conducted, teachers also expressed positive or negative impression on blended learning. Positive impression of teachers in general is associated with teacher professional aspects ranging from improving teacher performance, improve communication between teachers and students, and improving the efficiency and effectiveness of learning for blended learning degree of flexibility which is high. Napier, Dekhane, & Smith (2011) revealed that blended learning help to increase innovation in mindset of educators. Based on that, as a teacher, innovation and creativity need to be maintained to keep the attention of students during learning process.

A positive impression of implementation of blended learning does not just eliminate the reluctance of teachers in implementing the blended learning. The negative impression of blended learning, among others, the emergence of issues related to technical obstacles encountered, the unpreparedness of teachers towards blended learning because of poor IT governance. Ditigal mastery of literacy by teacher becomes a fundamental thing. There are two fundamental strategies in professional development related to technical issues that a recommendation by Summey (2013) that is related to skills training that trains operate technology, both hardware or software or training is focused on strategies related to the use of technology as a tool for learning. Other constraints is related to learning content preparation or evaluation that teachers felt very time-consuming and hard. Although studies conducted by Benson, Anderson, & Ooms (2011) reveals the ease of access of teachers to students, some studies actually show that it took a lot of time is also difficult to provide feedback one by one towards the students as reported Yalavaç & Samur (2016).

CONCLUSION

Findings of 25 studies were analyzed, namely that there are positive and negative impressions found from teachers and students related to blended learning. a positive impression of students and teachers obtained in general shows that it may improve performance, increase motivation and interaction, one of which is associated with aspects of blended learning flexibility. Negative impression arising both from teachers and students are generally associated with technical constraints such as limited access to the internet, server downtime, etc.. In addition to their terms, the problem of unpreparedness and lack of confidence both from students and teachers produce a

negative image. The importance of mastering digital literacy is one factor determining convenience of learning using a blended learning. It is recommended that the facility and infrastructure of technical aspects such as enhancing infrastructure adequate internet at the institutions. In addition, training for students and teachers to improve ITC mastery is highly required, especially for teachers as the main designer of blended learning.

PARENTS AND SCHOOLS PARTNERSHIP
FOR QUALITY EDUCATION
(CASE STUDY ON EXCELLENT SCHOOLS IN MALANG)

Raden Bambang Sumarsono

UniversitasNegeri Malang, Indonesia

e-mail: raden.bambang.fip@um.ac.id

ABSTRACT

This study aimed to describe (1) the form of a partnership of parents and schools, and (2) the strategy of building partnerships with parents. This research uses a qualitative research approach fenomenology. The design of the study using a case study on elementary excellent school in Malang, East Java, Indonesia. Data collected indeph interviews, observation, and documentation related to the theme of this study. Data analysis using descriptive analysis. The results of this study indicate that: (1) a partnership of parents and schools, including (a) a parent education, (b) voluntary activities, (c) a professional model, and (d) the model of kinship; and (2) the strategy of building partnerships with parents, include (a) strengthening the two-way communication, (b) the strengthening of associations of parents through community classes, (c) provision of the priority programs of the school, and (d) the creation of a positive school climate.

Keywords: forms partnerships, and strategies to build partnerships

The formulation of educational quality are dynamic and can be studied from various viewpoints. The quality of education should be pursued to achieve progress based on the planned change (Sagala, 2009). The Rugaiyah (2012, *p.*454) states "quality education is education that can give satisfaction even beyond the wants and needs of education stakeholders". Meanwhile Unesco (2005) explains that the quality of education is a dynamic concept that changes and evolves over time and changes in the context of social, economic and environmental problems in the place in question.

Quality education born from excellent school, the school has a good planning system, materials and systems of good governance, and delivered by a good teacher with a quality education component as well (Mulyasa, 2011). It is well known that, nationwide, quality education is still a crucial issue in this country. The problem of education quality is still a major problem. Quality improvement that almost every minister to be a program that sits on the Ministry of Education and Culture, but until now has not been completed. The quality of education has not been lifted and sat together with other countries, most improperly in Southeast Asia or Asia (Soetopo, 2012 *p.*3). Various efforts have been and are being made by the government, one of them with a government regulation (PP) No. 19 of 2005 jo Government Regulation No. 32 Year 2013 on National Education Standards, includes: (1) The standard of content; (2) the standard process; (3) competency standards; (4) The standard of teachers and education personnel; (5) the

standard of facilities and infrastructure; (6) management standards; (7) the standard of financing; and (8) the assessment standards of education. Through this regulation seeks government is hard to achieve quality education.

Conditions such as these have been anticipated by the various authorities so that the quality of education is ensured either scale local, national, and global. This is evidenced by the issuance of the Law of the Republic of Indonesia Number 23 Year 2004 on Regional Government, the authority in the management of basic education the greater given to the district/city governments, educational unit level, as well as the community that includes planning, implementation, monitoring and evaluation of education units (Sonhadji, 2013). Furthermore Imron& Sumarsono (2013, *p.*18) states, "one of the essences of regulation on decentralization and local autonomy in education is empowerment, opportunity, and freedom of comprehensive, real, and responsible to regions and communities to regulate and organize the affairs of compulsory education ". For all of the necessary effective school management.

School quality, in this case the elementary school (SD), is a school that is able functioning of all components of the school effectively and efficiently in order to create a conducive learning so that the goal of education achieved. Elementary school education is the foundation or the major foundations that need attention in earnest, it means to get quality higher education, must begin with the creation and establishment of SD quality. This is in accordance with the views expressed by Tilaar (2000: 17), that "quality basic education schools will be the formation of a further education (junior high, high school and college) solid and quality.

It is well known that, nationwide, quality education is still a crucial issue in this country. The problem of education quality is still a major problem. Quality improvement that almost every minister to be a program that sits on the Ministry of Education and Culture, but until now has not been completed. The quality of education has not been lifted and sat together with other countries, most improperly in Southeast Asia or Asia (Soetopo, 2012, *p.* 3).

The problems and challenges of the quality of education to show how education management require handling seriusa patterns as well as a systematic and thorough conditioning. Whereas the condition of education governance is currently inconclusive, and requires hard work to get out of the handling problems that exist (Soetopo, 2012, *p.* 3).

To realize quality school, there needs to be a synergy between the school and parents. Schools can not stand alone in meberikan all the needs and development of students, therefore, meaningful involvement of parents is always necessary. Partnership schools and parents in creating a quality school to be increased again. The quality of education will not work optimally, without any support from the public (in this case the parents of learners). In the Law of the Republic of Indonesia Number 20 Year 2003 on National Education System mentioned some roles that can be done by the community in education, which is regulated in Article 54 Paragraph (1) and (2), which reads:

(1) The role of the community in education includes the participation of individuals, groups, families, professional organizations, employers, and community organizations in the administration and control of the quality of education services.

(2) The public may participate as resource persons, implementers, and users of educational outcomes.

School as an institution where seeding science organized formally, very important role in improving the quality and identity of a person, to change the background of a person for the better, a good school is not only to change his protegebeing personally educated but also helped change the environmental community become better. Creating a quality school is a process that requires strong commitment and cooperation of all stakeholders of the school (Rugaiyah, 2012, *p.*455). The cooperation between the school and parents harmonious school will bring towards the achievement of quality.

Schools and parents have a very close relationship in the school or educational goals effectively and efficiently. Furthermore, they should also support the achievement of goals or meet the needs of older people, especially the needs of their children's education. Wiyono (2010, *p.*1) explains that "the process of education in schools, will be managed optimally, when supported by several parties, both the resources coming from the school, parents, and the community".

Therefore, the school is obliged to give an explanation of the objectives, programs, needs, and circumstances of schools to parents. Instead, they should also know clearly what yangh be the needs, hopes, aspirations and demands of parents, especially to schools. They (the parents) are given the opportunity to participate in school programs for the achievement of the vision and mission. Therefore, schools not only educate students, but also parents as family members of the school were important and included (Alwasilah, 2011). In other words, between the school and parents should be fostered and developed a harmonious relationship.

Wiyono (2010,*p.* 1) argues, "the school will not be able to optimally organize education, if they do not get support from parents and the community". With the establishment of a harmonious relationship between the school and parents, the participation or involvement of parents in bringing about the quality of education will be realized. Wolf research results (in the Ministry of National Education, 2007, *p.* 7) asserts that "there is a very significant correlation (0.80) between the family environment and the learning achievement of children". Speaking about the relationship between parental involvement and student achievement in schools Herman &Yeh (1983) states that there is a positive relationship between student achievement and satisfaction of parents to the school. This indicates that a partnership between families (parents) are significant factors in achieving the quality of schools.

Results of research Hewison&Tizard (1980) showed "the existence of a relationship between the involvement of parents of students with the achievements of the students in the school reading". Other findings from Preedy (1993) points out that "the involvement of parents in school activities positively affects students' learning progress and development". This indicates that the achievement of academic and non-academic will increase when there is participation from parents. Therefore, mobilization or empowering partnerships with parents of students are expected to synergistically lead to the goal of improving the quality of education.

SD NegeriKauman 1 Malang is one of the excellent schools in Malang which has many achievements both academic, non-academic

achievements of teachers, principals, and the only SD Negeri Referral in Malang that some time ago (in October 2016) successfully crowned as the winner of the 2nd in the event the Contest Quality Culture (LBM) Primary Schools National level for Category SDN Referrals. SD's success is certainly not independent of the existence of a partnership between parents and schools. Based on the exposure, researchers interested in conducting further study on the partnership of schools and parents in achieving quality education in primary schools Kauman 1 Malang.

METHOD

This study used a qualitative approach with descriptive research design case studies. Based on the design of the research, the researcher's presence is necessary because the researcher acts as a key instrument in exploring in depth information and detail.

This research was conducted in Kauman SD Negeri 1 Malang. Sources of data in this research using primary and secondary data. The primary data obtained through interviews with school principals, teachers, parents, administrators of the school committee, parents and community officials. While the secondary data obtained through documentation study and observation which is then analyzed and used as supporting evidence.

The procedure of collecting data in this study using three techniques are in-depth interviews, observation and documentation. Meanwhile, to analyze the data using three phases: reduction, presentation (display), and verification (inference) data. These stages are used to select and filter the information in accordance with the focus of research so that it can be concluded in accordance with the information obtained. Checking the data necessary to ensure the correctness of the information obtained by researchers. Checking the validity of research data includes three activities, namely, the extension of participation, triangulation, and perseverance observation.

RESULT AND DISCUSSION

Partnership looked all parties having an interest in the school is a party that can be utilized and able to assist the school in order to improve the quality of education. Based on the analysis of data obtained the following results.

Model Partnership of Parents and Schools

There are various models of partnership between parents and schools in achieving quality education, namely:

a. Education Parents

These partnerships are essentially want to assist parents in building awareness of the education of children, including by developing a learning environment at home that is conducive (safe, comfortable and fun); assist or accompany children while studying at home; gain a correct understanding of the child's condition and the efforts to do; enhance the positive role and responsibilities as parents in addressing the problems of children; and improve more harmonious cooperation between parents and schools in helping children problems

b. Voluntary

This activity aims to channel the aspirations of each party in support and help advance the education of children, a manifestation of this partnership are: mentoring children while following the race, prepare all the things that be necessary children in learning, assist schools in creating school Adiwiyata, assist schools in nulang day celebration of the school year, preparatory field trips, and a variety of other volunteer activities

c. Professional Model

This partnership model is more directed to aid parents in children's learning in school, for example as a resource for parenting dayactivities.

d. The Model Family

This partnership model is focused on the pattern of relationship between the school and parents as a single entity within the scope of a large family of schools. One form of this model is embodied in family gathering,

Strategy Building Partnerships with Parents

Strategies that schools can do in order to build partnerships with parents include:

Strengthening the Two-Way Communication

Communication is a means that is most crucial to build a better partnership with the parties. Therefore, the school must provide sufficient time to communicate regularly with parents. Strengthening two-way communication is intended for information and feedback on the development of learners, both from the family to the school and vice versa. School communication with the family can be done in various forms and media. For example, the information that is written routine through liaison book, homeroom regular meetings with parents, communication in the container community of parents per class, and communication through communication media such as through short messages (SMS), and other social media.

Strengthening the Parent Association through Association Class

Forming a community of parents in each class in order to facilitate communication between parents per class with the teacher in preparing children to learn. While the coordinator class community will be a channel of communication with the school and the school committee. Grade school through community associations, in this case aided in the learning process in schools.

Provision of Programs Featured Schools

The efforts of schools to establish partnerships with parents in improving the quality of education in the form of program making schools attractive to parents, such as: program fifteen minut in english, pacelathon Java, field trip program, outbound, the celebration of the birthday of the school, and a big celebration religion/national.

Creation of a Positive School Climate

Creating a school environment that kondusi for the implementation of partnerships with parents, namely through the friendly attitude of the parents, be patient in serving students and parents, to empathize with the parents, when parents come to the school received with familiarity, not put up surly, and greet the parents, accompanied by a smile, and of course, involve parents in the school program assembles.

DISCUSSION
Model Partnership of Parents and Schools

Partnership of parents and the school aims to achieve quality education. When a community decides to form a partnership, it is necessary to understand the significance of each party, an understanding in achieving goals, and is able to recognize as a familiar environment.

Parents and school partnerships established through a variety of models, namely parental education, volunteer activities, professional, and family. The model is believed to be able to realize the noble ideals that embody quality education.

The results are consistent with what was presented by Bacharach (1990) stated that their involvement (parents) can help prepare everything you need when their children will, during and even after attending a lesson at school. Parents can help classroom teachers to explain a particular subject matter according to expertise / skills of its (Reynolds et al., 1996). Riyani&Mantja (2008) suggests research findings that parents/guardians play a role such

as a substitute teacher educator (teacher subtitute) and facility providers (providers).

Their involvement and partnership of parents and schools in the field of education by Olsen and Fuller (2003) will provide benefits to the learners themselves, society, teachers, and schools. The benefits of parental involvement in the education for students include: (1) the learners tend to benefit more regardless of race and background of economic status, or educational level of parents, (2) the learners generally attain the rank, grades, and attendance better, (3) the learners consistently complete their homework, (4) the learners become more disciplined and showed a higher motivation to attend school, (5) the positive attitude of the students towards schools often provide results in the form of improvement of attitudes improved in school and rarely violate regulations, (6) learners are placed in classes remidial reduced in number, and (7) of students who come from different cultures tend to do better if the parents and personnel educators work together to bridge the cultural differences that exist in the family and the school.

Strategy Building Partnerships with Parents

Education is a shared responsibility between government, communities, and families (parents). Children learn and develop in a family environment, school, and community. When there is a strong link between school, family (parents), and the community, and involve them actively help businesses learning and development of learners, then it will contribute to enhancing the quality of education.

The findings of Herman &Yeh (1983) shows that the participation of parents is positively correlated to the learning achievement of children and parents on students' satisfaction.Duke & Canady (1991) stated in some research results are very reassuring that, the involvement of the school community, including parents/guardians of the students was very positive support the successful implementation of a policy. While Keith &Girling (1991) confirms that the active involvement of parents bring positive impact on students. Without the participation or support from parents, education (schools) will not work with the maximum (Kusmintardjo, 2010).

The results showed that the strategy undertaken by the school in building partnerships with parents, including: (a) strengthening the two-way communication, (b) the strengthening of associations of parents through community classes, (c) provision of the priority programs of the school, and (d) the creation of a positive school climate. The results of this study are consistent with the opinion of Rebore (1985) that in an effort to empower the participation of a parent or develop a

partnership between the school and parents, the school needs to pay attention to the principles, among others: (1) programs are designed to be easily understood and implemented , (2) sensitive to the aspirations of the people in this case are the parents of students, and (3) the idea contained in a simple and clearly communicated.

Partnership schools and parents can take place effectively, when schools can communicate with parents clearly and as often as possible (Bacharach, 1990). Communication is a means that is most crucial to build alliances or a good partnership with parents. Therefore, the school must provide sufficient time to communicate regularly with the parents (Kusmintardjo, 2010). There are some things that need to be done by the school in improving intentitas communications with parents, among which through the media: letters, websites, school magazines, school newsletter, telephone/mobile, and other social media such as whatshap, blackberry massanger, and line) , Other things that can be done by the school in empowering the participation of parents with through effective communication (Rohiat, 2010).

Bacharach (1990) argues that the management of partnerships with parents, can take place effectively when schools pay attention and develop the principle: "... (1) create a school that is open, helpful, and friendly, (2) give them the respect they (parents) were have demonstrated dedication and contribution to the advancement of education in schools ... ". Meanwhile, (Suryadi, 2003) stated that efforts to empower the participation of school parents should be able to foster cooperation with parents in a conducive and pleasant. The same is conveyed Kusmintardjo (2010) that "the attitude that needs to be developed in building a school climate that is conducive to, among other things: be friendly, flexible, open, passionate, empathetic, patient, and respect for others". The Rohiat (2010) calls "an example of things that can empower the participation of parents, such as giving praise to the parents, and the humane treatment ..."

CONCLUSION

From the results of the study concluded that: (1) a partnership of parents and schools, including (a) a parent education, (b) voluntary activities, (c) a professional model, and (d) the model of kinship; and (2) the strategy of building partnerships with parents, through: (a) strengthening the fabric of two-way communication between parents and the school, (b) the strengthening of associations of parents

through community classes, (c) provision of the priority programs of the school, and (d) the creation of a positive school climate for the continuity of partnership between schools and parents.

EFFECTIVENESS OF TRAINING WAYS TO BUILD CHARACTER IN EARLY CHILDHOOD

Radhiya Bustan; Nila Fitria

Faculty of Psychology and Education, Al Azhar University of Indonesia,
Email: radhiya_bustan@uai.ac.id

ABSTRACT

The negative impact of globalization should be anticipated early. Starting from the smallest structures in society. It would need to parents, teachers, and community members to understand how to build an Islamic character to children. For that, this research will describing about effectiveness of training "Ways to Build Character in Early Childhood" are given to the parents and teacher in kindergarten Raudhatul Azhar. Its objective is to provide insight to parents related psychological approaches appropriate future development of the child, so parents can fulfill their role in instilling positive and Islamic character in children. Characters in Islam is also called morals. Morals including adab include habituation, modeling, and discipline. The training materials provided to a parent related to "Ways to Build Character in Early Childhood - Psychological and Religion Aspects". And the material given to the teachers is about "Moral and Behavior Education in Early Childhood". The results illustrate that the training are required by parents, seen from the results of the evaluation that nearly 90% of parents feel gain related knowledge to build the character of children, although only about 85% of parents who have started to apply the material. Similarly, the evaluation results obtained from kindergarten teacher Raudlatul Azhar, that 90% of kindergarten teachers to acquire knowledge about the design and implementation of curriculum-based character of the training materials. Based on these results, obtained input for the next activity focused on material practice and chores are evaluated regularly.

Keywords: *islamic character, moral and behavior education.*

The era of globalization and modernization provides a major change in people's lives, including social, cultural and religious changes. Most of the young generation live with the "their" world and disregard the cultural values and morals their predecessor had adopted that long ago. This makes all sorts of gaps in society.

The negative impact of globalization should be anticipated early. Of course, from the smallest structures in society, which is family. Family is a "system", so it takes care of each of its members to give each other a comfortable and harmonious life for all family members. The application of the values that start from the family, will deliver each of its members to be ready to face the wider environment and the challenges of the times such as the current globalization. To that end, the character instilling is needed in order to minimize the negative impact of the incoming of foreign culture, as well as moral and religious education is needed so that the public has a strong grip in life.

Early character education in the family is needed. Like a building, of course, a strong foundation will make the building can withstand the windstorm. The earlier we instill character of the child, the more powerful embedded within them. Education starts from before birth and continues until becoming an adult.

Moral crisis could be caused because we do not yet understand how the right way, the right time, and effective approach when we have to instill a positive character to our children. Of course, we first need to understand their physical and psychological development. When we have understood it, we would be much easier to instill good or superior character to our children. Children will try to do things that are taught by religion, do what is best for themselves, others, the environment, state and nation. We will also be easier to motivate them to optimize the potential of (knowledge) itself and is accompanied by consciousness, emotion and motivation, thus realizing the young people who have faith and taqwa, science and technology.

According to the matters described above, it is important that parents, teachers, and community members to understand how to build an Islamic character for our children. What we need to understand and pay attention to in order to do it maximum. Of course, after knowing, the need for a strong determination to carrying it out. This will be covered in the "Ways to Build Character in Early Childhood.

This training refers to previous studies we've done, which is "Parents' Hope on Educating Early Childhood Children" which the results f the research said 80% of parents want child development training materials, which we have already conducted the training in 2014. Other results from these studies indicate that the majority of parents stated that they urgently need activities aimed at studying new ways of interacting positively with their children. In connection to this,

we want to continue the training with related materials of "Ways to Build Character in Early Childhood" given to parents and teachers at Raudhatul Azhar Kindergarten.

The purpose of this research is to understand whether the "Ways to Build Character in Early Childhood" training can change parent's behavior on building a kid' s character.

The problem in this research Is the training of "Ways to Build Character in Early Childhood" at Raudlatul Azhar kindergarten can be effective as a tool for parents and teachers to provide character education from an early age? This training will be given to 90 parents who have their child attending at Raudlatul Azhar kindergarten and 12 teachers.

Family. The family is a group of people with ties of marriage, birth, and adoption which aims to create, maintain the culture, and enhance the physical, mental, emotional, and social activities of each member of the family (Duvall and Logan, 1986). In the family is built the physical, mental, emotional, and social development of each family member. So families can build a unified whole in its development.

Another case according to Baiolon and Maglaya, said family is two or more individuals who live in one household connected by blood, marriage, or adoption. They interact with eachother; have their respective roles, creating and maintaining a culture (Bailon and Maglaya, 1978). Blood relations connect their blood and marriage. According to the Ministry of Health explained that the family is the smallest unit of society, including heads of families and some people who get together and stay somewhere under one roof in a state of mutual dependence. For the family, it acts as the first and foremost educator whereas in the education in it has a dependency between one another.

Character. In the era of 2000, education in Indonesia bloomed with their character education. We know that the characters in the Islamic religion is known as the word morals (akhlak). According to Lickona, characters are related to the concept of moral, moral feeling, and moral behavior. Based on these three components can be said that characters are well supported by the knowledge of the good, the desire to do good, and do deeds of kindness. So that character education can be defined as any attempt to influence the character of the students.

But to know the proper definition, it can be mentioned here the definition of character education delivered by Thomas Lickona.

Lickona stated that the definition of character education is a deliberate attempt to help someone so that he/she can understand, pay attention, and do the ethical core values.

Meanwhile, according to Kertajaya, (2010) character is the hallmark of which is owned by an object or individual. The distinctive feature is original and rooted in the personality or the individual objects, as well as an "engine" that drives how an act, behave, say, and respond. Personality that must be built from an early age, integrated into the early childhood curriculum which has 18 grades of character, namely: (1) Religious, (2) Honest, (3) Tolerance, (4) Discipline, (5) Work Hard, (6) Creative, (7) Independent, (8) Democratic, (9) Curiosity, (10) National Spirit, (11) Love the homeland, (12) Appreciating the achievements, (13) Friendly/ communicative, (14) Love Peace, (15) Joy of reading, (16) Care for the environment, (17) Social Care, and (18) Responsibility.

Then, according to Suyanto, the character is a way of thinking and behaving that became the hallmark of every individual to live and work, both within the family, community, nation and state. Individuals who have good character is an individual who can make decisions and be ready to be responsible for every decision made as a result (Ansori, 2007).

According to Sahrudin (2007), efforts to establish the character of the child is very important. Therefore, it aims at forming personalities noble, tolerant, happy to help, mutual help, mentally tough and competitive, and always had an interest in science. All of this capability is based on the faith and devotion to God Almighty.

The values of these characters are developed in each of the existing competence in the teaching and learning activities in schools. But it cannot form a good character if it is not done in informal education, which is family. Parents play a major role in shaping the unique character of children.

Methods in this community service activity is with training as the intervention. Intervention is an action that results in a change or attempt to change the person, population, or organization that is the subject of evaluation (Øvretveit, 1998). The purpose of intervention is to make a change and make a difference in someone's life (Øvretveit, 1998). The form of intervention is training which is the next stage of implementation of the research results related to "Parents' Hope at Educating Early Childhood Children".

METHOD

This research method uses experimental method with one group experimental research design *(one-group post-test design)*. According to Christensen in Seniati (2009), this design only

involves one group given the manipulation, then in certain period of time, it is measured for the response.

In this research, the manipulation is training "Ways to Build Character in Early Childhood". Then, often given the training, it will be seen its effectiveness.

Training of "Ways to Build Character in Early Childhood" is held at Raudhatul Azhar Kindergarten, Kreo, city of Tangerang. The numbers of kindergarten students at Raudlatul Azhar are 90 children with 12 teachers. To that end, the target of community service activitiy are parents and teachers. Raudlatul Azhar Kindergarten was established in 1993. Learners come from the weak economy, where the backgrounds of the parents work as a taxibike man, a laundress, and also those that were an employee.

RESULT AND DISCUSSION
Training Implementation Overview

"Ways to Build Character in Early Childhood" training was planned to be given to the 90 parents who have their children attending at Raudlatul Azhar kindergarten. But on the day of implementation, only 48 participants who attended, because the activities conducted was on weekdays and most parents had to work.

A speaker at the second session was Radhiya Bustan, M. Soc, Sc. The theme for this session was "Kid's Character Building" (Material attached). This meeting was held on May 2nd 2016 at the Hall of Raudhatul Azhar Kindergarten.

Before starting, the speaker invites parents to discuss related ways of educating a child character they've done today, what constraints and what measures taken to overcome them. Some parents said that they educate children more dominant by giving advice, if the child does not listen, parents often feel unable to hold back their emotions and ultimately scold and yell at the child. Through a process of discussion, it appears that most parents can not understand child development, so it has not been able to maximize the effective ways to educate children character according to the level of their development, such as by example, reading stories / story of the Prophet, to form positive emotions by playing together, and so on.

Character in Islam is called morals. Morals including adab include habituation, exemplary, and discipline. Morals of the Prophet Muhammad are the role model for Muslims, so it needs to be introduced to children early. By knowing the nature and character of the Prophet Muhammad, is expected children can imitate and emulate the Prophet morals in everyday life. Therefore, the material presented by the speaker is relevant to character and morals of the Prophet as role models for Muslims, as Allah SWT says in surah Al Ahzaab:21.

The speaker then invites parents to listen to stories, movies or discussions related to the themes of morality of the Prophet as follows: 1. Clear of angry nature; 2. Do not like pitting; 3. Do not sneer; 4. Never overbearing; 5. Clear of malicious nature; 6. Spread the greeting; 7. Relax and do not rush; 8. Glad to help; 9. Keep prayers at the mosque; 10. No prejudice; 11. Loved fellow; 12. Maintain the mandate and far from being treasonous; 13. Respect the older; 14. Maintain cleanliness; 15. Spread a smile; 16. Clear of hostility; 17. Always humble; 18. Leaving fraudulent ruse; 19. Never lie, saying vile, and do ghibah; 20. Always pray every wanted to do thing; 21. Be gentle and not harsh; 22. Very forgiving; 23. Gracious (generous); 24. Strong and courageous to defend the truth; 25. Love animals, and 26. Helpful for others.

In the discussion of these themes, are discussed effective ways for parents in instilling moral character or the Prophet's moral. Starting from building emotional intimacy with children in order to create positive emotions.

Building emotional intimacy with children is done through effective communication, through the following way: 1). Using the word "want" when we ask a child to do something; 2) Staring at a child's eye when we communicate with them; 3) Accompanying communication with physical contact; 4) Being a good listener when the child is speaking; 5) Loving a child in a way he loved

Parents were asked to evaluate the extent to which they have to communicate effectively with their children. Most parents admitted they do not apply it. Then the parents were asked to give examples of behavior that has been done so far and they would do at home. Examples of such behavior were discussed within the group mutually. Then the parents were asked to complete a commitment to practice at home.

Some other issues related to the development of psycho-social abilities of children was also discussed at the meeting, among others, are: 1) Communicating with love with words full of affection, praise, encouragement, guidance, calls "dear" to children; 2) Give a gift; 3) Serve the child until he is able to give examples, such as teaching children to serve yourself and others; 4) Friendly with children; 5) Provide physical touch; 6) Fulfilling the wishes of children gradually

Psychosocial development of children needs to be based on religious teachings in order that the child has a character that is in accordance with the guidance of the Islamic religion. The things a

parent can do is: 1) Establish honesty and familiarize the child to keep a secret; 2) Building social trust through habituation to help parents, along with peers, empathy; 3) Build trust by starting from the scientific teaching of the Qur'an and the Hadith of the Prophet which is a source of knowledge; and 4) Build entrepreneurial spirit, as exemplified by the Prophet.

Examples of Rasulullah performed in educating children to set an example also for parents in developing positive character traits in their children. At the end, question and answer session was done with parents to strengthen the material that has been given in order to be well understood. Questions submitted related practical tips in building the character of the child (such as building characters child discipline that is difficult to get up early and pray, tidying up their own toys, etc.). The speaker then provides answers to refer back to the content of the training material, and then gives practical examples that parents can do at home.

The second session of training was done for the teachers of Raudlatul Azhar kindergarten. Training of character education at the kindergarten were attended by 11 teachers of Raudlatul Azhar kindergarten (1 teacher was unable to attend due to giving birth) held on Saturday, June 25th 2016 starting at 08:30 to 10:30. The training activities starts with a discussion of the character and what activities are already done at the kindergarten. After starting the activity with a discussion of the kindergarten teachers of Raudlatul Azhar, realize that a lot of values character that have not been applied. In this case the kindergarten teachers say that they have long know about character education but do not understand how to apply it. For that mother Nila Fitria, M.Pd as a speaker provided an explanation of what that character, character education, character education goals, values early childhood character education, the role of teachers in character education and character education planning. After giving the matter by Mrs. Nila, then followed by a question and answer session. Mrs. May as Headmaster of Raudlatul Azhar kindergarten asked how to deal with difficulty in collaboration with other teachers? Then Mrs. Nila replied that every teacher that is present here are already bringing each character that is the result of education of parents, teachers, and the environment in the past. When a teacher is already in the new environment of school, then you should be able to adapt to the new environment. One teacher also asked Mrs. Anis, how to deal with a child character that likes to

say no good? Mrs. Nila answered, it should be observed first, the teacher should ask the child's parents about the routines that he/she do at home. Then do a home visit with the intention of equating teacher's data as the result of conversations with parents. Usually when it is already done, the teacher can see the behavior of a child who likes to talk dirty it was influenced by whom?

Character education training activities on teachers at the kindergarten ended with a group photo and a souvenir gift to the school. Expectations of this activity is the teachers are able to plan and implement character education in learning activities

Evaluation

Participants were given questionnaires related to the evaluation of training effectiveness. The questionnaire was brought home and charged at home. After 2 weeks, the new questionnaire is collected in order to see the extent to which parents can benefit from training, whether it has been able to understand the material and then apply it at home on their children or not. The results of the questionnaire illustrate that:

No	Aspects of Assessment	Percentage answer of "YES"
1	The suitability of the material to the needs of parents	90%
2	The training material is easy to be understand	88%
3	The timing of the training is suitable	85%
4	Raises motivation to form a new pattern in educating children	88%
5	Changes in attitude on educating children after training	90%
6	Acquire new knowledge	90%
7	Mother and child relationship got better	90%
8	Becoming more excited through the days as parents	90%
9	Already started to practice the knowledge gained from the training	85%

Based on the able above it says that almost 90% of participants, namely parents of Raudhatul Azhar kindergarten found the training of "Ways to Build Character in Early Childhood" make a positive impact on them in educating and building a child's character.

The results of the questionnaire awere also reinforced with random home visits to three participants. The aim is to triangulate data by observing and obtaining information from the

family if the trainees have started to apply tips to build the character of children in their homes. Of the three houses visited, the result that two people have already begun trying to implement positive ways to communicate with children, starting from very simple things. 1 person was still not able to apply because it was still difficult to control emotions and change the habit of scolding children. But the person promised to strive to improve and change the habit. This information was also confirmed by family members who were in the house at the time.

The results of the questionnaire were 90% of kindergarten teachers will design to create a character-based learning programs and 90% will practice the knowledge given in KBM. Kindergarten Teacher of Raudlatul Azhar felt acquiring new knowledge and will become a role model for their students as much as 90%. The timing of activities in accordance with the desired time, where Raudlatul Azhar kindergarten teacher in the school holiday period and will prepare for the start of the school year. As many as 90% of teachers were eager to teach after obtaining knowledge.

CONCLUSION AND SUGGESTION
Conclusion

Based on the community service that we've done in the form of training "Ways to Build Character in Early Childhood" given to 48 parents and 12 teachers, the result that the associated training needed by parents, and results from evaluations filled out by parents that nearly 90% of parents feel they receive related understanding of the child's character building training materials. However, only around 85% of parents who have started to apply the material. Similarly, the evaluation results obtained from a kindergarten teacher Raudlatul Azhar. That 90% of kindergarten teachers acquire knowledge about the design and implementation of curriculum-based character of the training materials. It is also confirmed from the results of home visits to there trainees' house.

Suggestion

Based on the results, the suggestions for further activities so that more material is added; practice and chores are evaluated regularly. Given the theoretical understanding at the meeting. In addition, the training is expected to build character is also given to the male parent, that parenting at the home can be consistent and run with full commitment together between parents and the school.

ASSESSING FACULTY DEVELOPMENT NEEDS:
THE CASE OF MINDANAO STATE UNIVERSITY

Rasid M. Paca; Engr. Maryam Q. Manalundong

Mindanao State University, Philipina

e-mail: msumain.ovppd@gmail.com

ABSTRACT

Assessment is an essential process of gathering necessary information useful for evaluating the needs of a certain variables. In this study, assessment was primarily used to examine the faculty development needs of the Mindanao State University Marawi Campus. Variables investigated through survey, focus group discussions and consultative meetings include faculty profiles, trainings, performance, research and publications, housing program, appointment status, study grant and promotions, and the needs for faculty enhancement program. Based on the data gathered from the survey and series of consultative meeting/focus group discussion in the different colleges in the university, comprehensive results revealed that, the faculty force of Mindanao State University (MSU) in terms of educational attainment, trainings, and research outputs is not enough for the university to be considered as candidate for center of excellence and or center of development. Faculty needs motivation such as financial supports, conducive learning environment, enough housing program, continuous and regular attendance of fora and other professional growth are the most urgent needs of the faculty. Generally, MSU administrations need extra efforts in providing faculty development needs so that the university will meet the requirement to achieve center of excellence and center of development.

Keywords: assessment, faculty development, faculty needs, faculty feedbacks

Productive working environment requires skilled and competent employees. Having competent and skilled employees can do complex tasks efficiently, effectively and in safe manner. Universities around the world precisely attempt and initiate different plan and strategies in applying the idea of ―quality‖ in the context of education. Globalization and global competitiveness towards academic excellence continues to be a challenge as it is reflected to quality that signifies different means of coping with the continuous intense competitiveness. Instructional quality plays a vital role in attaining the framework of quality education. Growing evidence has been set that students are most motivated to learn and excel when teachers are strong on all three legs of the instructional tripod that is: content knowledge, pedagogic skills, and relationship skills. The importance of teacher effectiveness in providing quality learning experiences to all students is absolutely clear. However, some teachers produce much larger achievement gains than others do and that differences in teacher effectiveness tend to persist from year to year in the absence of effective professional development (Ferguson, 2007).

In the Philippines, the Commission on Higher Education Memorandum Orders (CMO) in attaining Center of Excellence (COE) and or Center of Development (COD) gives more emphasis and percentage to instructional quality research and publication. Key persons that give instructional quality are the faculty since they are the prime movers and doer in delivering instructions to the students. However, studies conducted which was reaffirmed by UNESCO reports (2003) revealed that quality education is declining especially in developing countries in which Philippines is part of it due to problems and challenges face by the teachers and learners which includes lack of classrooms and instructional materials, inadequate teachers, and no appropriate funds for faculty development and among others. Given this deficiency, assessing faculty development needs is much needed in order to address the so called ―attaining academic excellence or center of excellence in educational services. According to Irby, O'Sullivan and Steinert (2015), faculty development is an indispensable and often undervalued institutional resource, yet it plays essential role for the advancement of faculty competence and organizational vitality. In the World Education Forum, Dakar (2000) stipulated that to achieve education for all it needs to improve the quality of education. He said *"Improve all aspects of the quality of education to achieve recognized and measurable learning outcomes for all-especially in literacy, numeracy and essential life skills"* Development is a lifelong process. It's a way for people to assess their skills and qualities, consider their aims in life and set goals in order to realize and maximize their potential (SkillsYouNeed.com©2011-2016).

The purpose of this paper is to assess and examine the status of the faculty in terms of educational qualification/educational attainment, terms of appointment, seminars and trainings

attended, faculty housing program, research outputs, enhancement needs and personal perceptions of the teachers. Assessing faculty development needs was done through needs assessment analysis and consultative meeting, for us the Mindanao State University (MSU) office for planning and development could draw a workable development plan that could address the issues on faculty development needs.

METHOD

Assessment has many purpose, it could be used to appraise the performance of the students or teachers, and to provide feedback. In this study assessment was used to dealt on the present status of the faculty in MSU in order to identify and evaluate their needs and feedbacks was drawn. This study documented the faculty development needs through needs analysis and consultative meeting using survey questionnaire and focus group discussions in each college in the university. The data was gathered through a series of formal and informal consultative meetings apart from the survey questionnaires. Aside from survey questionnaire, focus group discussions and consultative meetings, data from annual reports of the university was also used as data source that serve as platforms of the previous issues of the variables investigates so as to draw conclusive evidence on the faculty development needs.

RESULTS AND DISCUSSIONS
Results
MSU Faculty Profile

Faculty profile of the MSU includes educational qualifications and trainings attended. Educational qualification of a university faculty is an important thing to consider in planning towards attaining academic excellence. Based on the collected data, out of 856 faculty respondents who successfully participate the assessment survey only one hundred thirteen (113) or 13.2% are Ph.D. holders, and among the seventeen colleges, the faculty of the

College of Agriculture has the highest percentage (17.78%) of PhD holders, followed by the College of Forestry (17.39%), and then the College of Public Affairs or CPA (16.88%). In general, less than 50 % of MSU the faculty members are master's degree holder (44%).

However, combining the numbers of PhD's and masters' degree holder it comprises 57.2%, yet this percentage is still weak considering that the university is aiming to be known as either center of excellence and or center of development.

Based on the standard criteria of the Philippine Commission on Higher Education (CHED) center of excellence and center of development instructional quality comprise 45% of the total key areas in which faculty force and qualifications has a greater percent composition (30% - 40%) of its components depending on the course or field. According to this standard criterion, faculty is the primary operative resource in the academic institution.

Faculty shoulder the institution's responsibilities to teach and facilitate learning, generate new knowledge, and assist in providing service programs of the institution to the community. The faculty roster of every field or course areas must be composed of professionals in terms of education, experience and skills.

The minimum requirement of the Philippine CHED for a certain degree program to be acknowledge as either center of excellence and center of development is that there will be at least five (5) full time PhDs' and two (2) PhDs' plus three (3) masters' degree holder respectively. However, this requirement is just a minimum and it will vary according to the degree programs of each college of department. As shown in Table 1 and the succeeding figures (Figure 1 and Figure 2), the Mindanao State University (MSU) Marawi Campus, the number of faculty members in each college who are PhDs' is not enough or does not meet the minimum requirement to be a candidate for Center of Excellence and or

Center of Development except for the two programs or department under the College of Natural Sciences and Mathematics namely Mathematics and Biology Department.

As shown in figure 1, the trend of the MSU faculty educational attainment is fluctuating. There is no continuous progression especially in the higher education of college faculty. This trend implied that the MSU failed to maintain or sustains the professional growth of its faculty by sending them to further studies and by giving them opportunity to avail study grants. If this trend will not be mitigated then, MSU could not really attain its goal towards a center of academic excellence or center of development.

In terms of trainings and seminars attended by the faculty of MSU as shown in Table 2, generally less than 50% of the faculty in each college attended various trainings and seminars except for the sole college, the College of Sports, Physical Education & Recreation (CSPEAR) in which almost all of them (95.83%) attended various trainings and seminars. Again, Philippine CHED memorandum for center of excellence and center of development stipulated and clearly emphasized that self-improvement among faculty such as

participation in postgraduate programs, trainings and skills development are deemed necessary.

Further studies, trainings and seminars are important motivation on the part of the faculty with the interest to improve its prime resource. Irby, O'Sullivan & Steinert (2015) study related to recognizing excellence in faculty development programs revealed that the faculty development program takes place in accredited professional schools which should be aligned to the school missions and goals. Faculty development program must be systematic, evidenced-based and must focus on improving educational practices, leadership and scholarships. Teachers at professional higher or educational institutions have the task to arrange the conditions that would enable the students to absorb fully the knowledge transfer, techno-transfer and any form of education and learning. University should optimally provide competent graduates and solve problems related to in depended monitoring educational processes and surely produce graduates which are in demand in the employment market (Safargaliev & Vinogradov, 2015).

Faculty Research & Publication

Research and publications is a strong manifestation of a matured university. Research and publications is one of the important vehicle in making linkages and collaborations to other universities around the world. Literature and studies survey reveals that external integration of education is very important especially on this globalization theme. Interrelations between universities that allow networking and collaborations are a promising strategy towards gaining more diverse and productive forms of integrations towards achieving academic excellence, research and extensions. However, in the case of MSU Marawi campus, the research outputs of faculty in not progressive. Only few of the faculty has successfully conducted research due to overloading of teaching loads. The MSU research and publications has not given priority, thus faculty are not motivated to do so. This research outputs issues are same as true in terms of research publications. As shown in Figure 2, research publications are fluctuated. In the year 2015 publications rises however, in 2016 it drastically moves downward. The trend on research

and publication implied that the MSU failed to sustain the research capabilities of its faculty. In fact, the MSU is missioned to perform the traditional trilogy of functions of a university, namely: instruction, research, and extension.

Study conducted in U.S. by Mullen, Murthy, & Teague (2008) revealed that availability of sufficient laboratory space, equipment's, financial and material resources were deemed critical for supporting faculty's efforts in doing research.

Housing Program

Another need that is relevant for efficient and competent performance of the faculty in the universities and any other institution is the housing program intended for the faculty. In order to attain productive and sustainable academic excellence, faculty must be self-motivated. However, if the faculty has a long-way to travel from their home to the campus, the situation might be chaotic and stressful and could suppress the utmost transfer of knowledge from the teachers to the learners. In the context of globalization and academic excellence, educational environment or school climate must be conducive to both teachers and students. Many universities in other countries efficiently provide housing program for all of its

employees. Nanyang University in Singapore is a very good example in terms of providing housing programs for their employees and the university environment is conducive to all constituents.

In the case of MSU Marawi Campus, Table 4 shows that there is no equal distribution of housing programs to the faculty and other employees of the university. Majority (69%) of the employees in the university are either renting private cottages or commuting from the campus to their respective home which is either in Marawi City and Iligan City. These results implied that the employees of the university have no equal opportunity in terms of housing program. Maybe the university could not provide enough housing for its employees or there it might be no proper regulation in terms of its housing program. Since most of the employee

particularly the faculty is commuting, traveling from their respective homes to the university and vice versa could hamper the efficient delivery of their services. They might be late in the office due to some unavoidable circumstances during travel like traffic or mechanical malfunction of the vehicle and others. Based on interviews, commuters' faculty are avoiding to handle early schedule classes and classes in the late afternoon because they having troubles of their travels. This issue must be resolved by the university officials so that attaining its missions and goals towards academic excellence and globalization will not be jeopardize.

Study Grant

Professional growth of faculty is very important in attaining academic excellence and globalization. As of 2014 records provided by the annual report of the Mindanao State University, study grant provided to the faculty by MSU is not progressive. As shown in figure 4, year 2013 has the highest number of faculty that is on study grant on doctoral degree. However, it abruptly decreases in the year 2014. In the case of maters' degree program there is a progression increase number of faculty on study grant for 2011 and 2012, but decreases as much in the year 2013, and manage to increase again in the year 2014. The fluctuation of providing study grant program of the faculty implies that the university does not seriously prioritize the professional growth of its faculty regularly. According to Monterona (2014), human resource is the most essential components in any organization. Each employee brings to the organization different skills, knowledge, and ideas that help the organization or university attaining its goals. An employee must continuously grow professionally in order to keep abreast on the un-ending change in the process of learning, education and innovations. Professional growth in terms of continuous education through study grant, trainings, and symposia is the process of preparing the manpower of the university towards innovations and educational revolutions of the mind in terms of multidimensional basis for the solution to a wide range of pedagogical and content knowledge problems. Continuous education and learning is an educational process in any educational system or universities that serve as reference points on the development of heuristics and exploratory capabilities to face the challenge of global competitiveness.

Other Needs

Faculty needs enhancement in all aspects namely; training and conferences, research, and further studies through scholarship programs and study grant. They also need enough housing

program, regular monitoring in the process of giving tenure and promotion. Incentives, hazard
Figure 4 Study Grant of MSU Faculty
Source: Annual Report 2014

fees, and equal opportunity are mostly requested by them. Moreover, motivating factors that drives the faculty to do efficiently their jobs is also one of their concerns considering that most of the time or none at all. Mullen, Murthy, & Teague (2008) concluded in their study that university infrastructure and organizational structure and culture are important factors to consider so as achieving academic excellence. . Furthermore, the working environment of the faculty must be conducive enough so that they will become more productive. Housing program must be also properly regulated so that all faculties can avail such privilege. Lastly, school climate must be friendly and just. A sound and healthy organization is depicted through social and professional interactions of the employees (Sia-ed, 2016).

CONCLUSION

Development of educational process towards academic excellence and globalization is of current interest to all educational institutions and universities. However, these could not be attained if manpower especially faculty are equipped totally in transfer knowledge and skills to the learners. For many institution and university including the Mindanao State University, the most serious drawbacks in the attaining of academic excellence should begin to comprehend the pedagogical content knowledge of the faculty, and the different activities in conditions of the further existence and development of mankind as a whole. Based on the findings of this needs assessment survey, MSU needs to capacitate the faculty in terms of instructions and research. MSU officials must regularly provide study grant to the faculty in each college with proper selections, monitoring and time bound. There must be proper execution and implementation of the MSU Code of governance on the case of faculty development programAll learning

institutions must see to it that the organizational structure is bound to proper ethics that could serve as guiding rules in monitoring the university climate and health conditions. Giving incentives and other form of motivations must be equally distributed to the deserving faculty members and other employees in the university. Commitment and cooperation of every employee and higher officials in the university is significantly needed to effectively promote faculty development and in this way, academic excellence and globalization will surely attain. Analyzing the needs of the university employees is a continuous process and must be done regularly in every institution. Assessing faculty development needs is a continuous process because the mood of the school campus environment and the needs of the faculty are always changing. Hence, the task of faculty development needs assessment must be regularly conducted and monitored so as to develop plans and strategies in order to address those needs and for continuous development towards academic excellence and global competitiveness.

BAWANG PUTIH DAN BAWANG MERAH
LITERATURE STORY BOOK USEDAS A MEDIA TO INTEGRATE TEMATIC INSTRUCTIONAL FOR THE FIRST STUDENTS OF ELEMENTARY SCHOOL

Ratna Trieka Agustina
State University of Malang, Indonesia
Email: ………………

ABSTRACT

The aim of the research is to create a Bawang Putih and Bawang Merah literature story book which is able to use as a based fondation to integrate tematic instructional for the first grade of elementary school. The creation of Bawang Putih and Bawang Merah Literature book focused (1) the content area , (2) the language , and (3) the ilustration of the literature story book. The result of the research shows that (1) the content area of the literature story book is very efective to be used to integrate the tematic intructional for the first grade students of elementary school. It makes easier for the elementary teacher to implement the first and the second core competence in the 2013 curriculum which focus on spiritual and morality education; (2) the language which appropriate with the students mind development makes the students easy to understand the story so that they feel enjoy to study; (3) The ilustration of the book which is designed colourful can make students enjoy to story. It is hoped that the elementary teachers can develop or increase the other media that can integrate the tematic instructional as the elementary school.

Keywords: literature story book, media, integrate, tematic instructional

The Indonesian Curriculum of Elementary Education 2013 stated that theme-based learning in first grade of elementary school highlights the importance of Main Competence 1 (spiritual), Main Competence 2 (social), Main Competence 3 (knowledge), and Main Competence 4 (skill). The characteristics of elementary education are coherence, integration, purposiveness, and authenticity. The integration and combination of learning contents are put under the same theme along with various sub-themes consisting of different subject matters. Curriculum 2013 emphasizes the aspect of moral and spiritual, while the knowledge aspect is only available in small percentage.

In order to effectively build the moral and attitudes of the learners, each learning activity will be based on aesthetical and behavioural value. Integration, context, authenticity, and purposiveness of learning activities can be presented through storybook. Language competences of the students, including reading, writing, listening, and speaking competence, can be developed by actively engaging the students with the storyline. The students will not simply be able to enhance their language competences by learning the principles of the target language; instead, the students are required to directly use the target language. Jonson D Terry and Loise Daphne R (1987:2) stated that *"Children increase their ability to use language by becoming involved with language."*

By engaging the students with storytelling activity, they can use their language competences through (1) recognizing alphabets, (2) shared reading, (3) writing their favourite parts of the story, and (4) roleplaying in their preferable ways. The teacher may try to explain the storyline in order to combine integrated themes with the curriculum and develop the moral value of the story in building students character. Later on, by using literature books in storytelling activity, the students may acquire aesthetic reading ability. Cox and Many in Cox (1993) stated that *"Aesthetic reading opens up wolids of possibilities for teaching with literature."*

According to the result of PPLG district 115 of elementary teachers in Batu, it turns out that theme-based learning nowadays is mostly student activity book-oriented, which means that the teachers do not encourage any innovation in their teaching and learning activities. Aside from teacher guidebook and student activity book, the teachers are required to make use any other learning media creatively. Unfortunately, most schools still suffer from the lack of literature books which are well-composed in terms of content, language mechanics, and illustrations that are suitable for the mental age and language development of first grade students of elementary school. Therefore, the literature books used in theme-based learning for first grade students of elementary school should be well-developed with proper regard to the content appropriateness, language mechanics, and illustration.

Big Book is one of the story books that can be used in theme-based learning as it consists of storyline written in large font and large, colourful

illustration, thus can be classically attractive to elementary students.

The objective of the literature books development is to describe literature book that can be used as learning material for first grade students of elementary school. The descriptions used to combine different subjects in theme-based learning for first grade students are including (1) the content of the story, (2) language mechanics, (3) illustration, and (4) storybook prototype.

METHODS

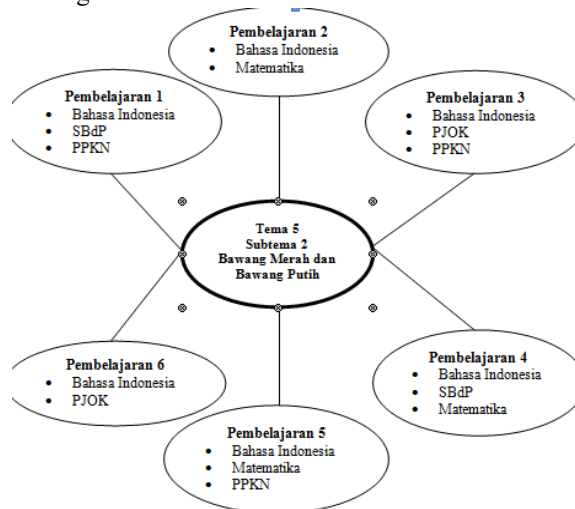
The method used in developing literature book is descriptive qualitative approach, which can be used to describe these related matters: (1) the area of story content in regard with the mental age of first grade students, (2) language mechanics in regard with the language development of first grade students, and (3) storybook illustration to meet the interest and preference of first grade students.

In general, the research design used in this study is based on Research and Development (R&D) found by Borg and Gall (1979), which steps are including (1) research and information collecting, (2) planning, (3) developing preliminary form of the product, (4) preliminary field testing on limited scale, (5) preliminary product revision, (6) main field testing, (7) main product revision, (8) operational field testing on wider scale, (9) final product revision as suggested by the result of operational field testing, (10) revision and distribution. In this study, the researcher only apply and modify some of those steps.

After reviewing the aspects of content appropriateness, language mechanics, and storybook illustration, it is decided that an Indonesian folktale entitled "The Garlic and the Onion" is suitable to be used in theme-based learning for first grade students of elementary school.

The storyline of "The Garlic and the Onion" can be used in combining different subject matters on theme 5 "My Experience", sub-theme 2 "Having Experience with My Friends" consisting of learning activities 1-6, those are:

Activity 1: Indonesian language, Art and Culture Education (*SBdP / Seni Budaya dan Prakarya*), and Civics Education, (2) Activity 2: Indonesian language and Mathematics, (3) Activity 3: Indonesian language, Physical Education, and Civics Education, (4) Activity 4: Indonesian language, Art and Culture Education (*SBdP / Seni Budaya dan Prakarya*), and Mathematics, (5) Activity 5: Indonesian language, Mathematics, and Civics Education,

and (6) Activity 6: Indonesian language and Physical Education. Below is the distribution draft of the learning media combined with literature work entitled "The Onion and the Garlic". The distributed learning media is about to be distinguished into different clusters as follows:


Each one of different the subject matters combined with the storyline of "The Garlic and the Onion" is described in the following Main Competence.

Activity 1

There are different contents of Indonesian language subject in the Main Competences, which are: (1.1) to accept Indonesian language as a God's blessing which is also known as the national language and is a subject of learning among other vernaculars, (2.1) to promote awareness and curiosity towards the concept of figure and nature of things by using Indonesian language and/or vernaculars, (3.1) to be familiar with descriptive text on the body parts and five senses, the figure and nature of things, and the exchange of day and night with the help of teacher or other students to answer the questions in Indonesian language related to the storyline of "The Garlic and the Onion", both oral and written, in which the students may answer the questions using any vernacular vocabulary, and (4.1) to listen and practice descriptive text on the body parts and five sense, the figure and nature of things, and the exchange of day and night, then individually answer the questions in Indonesian language related to the storyline of "The Garlic and the Onion", both oral and written, in which the students may use any vernacular vocabulary.

There are different contents of Art and Culture Education (*SBdP/ Seni Budaya dan Prakarya*) subject in the Main Competences, which are: (1.1) to feel the beauty of nature as an evidence of God's mighty power; (2.2) to acknowledge the inspiring beauty of surrounding nature in art-making process, (3.5) to acknowledge the Indonesian vernaculars and cultural products;

indicator: distinguish the sound of various forest birds, and (4.17) to describe Indonesian vernaculars and cultural products; indicator: to describe the musical piece used in "The Garlic and the Onion".

There are different contents of Civics Education subject in the Main Competences, which are: (1.2) to admit that diversity in school and neighbourhood is a God's blessing, (2.3) to express togetherness in regards with diversity in school and neighbourhood, (3.3) to observe and describe the togetherness found within diversity in school and neighbourhood; indicator: to discuss the meaning togetherness within diversity through the sound of forest birds, and (4.3) to observe and describe the togetherness found within diversity in school and neighbourhood; indicator: to practice togetherness within diversity through imitating the sound of forest.

Activity 2

There are different contents of Indonesian language subject in the Main Competences, which are: (1.2) to believe in the mighty power of God in creating nature, human beings, and various languages throughout the mankind history, (2.5) to express good behaviour and honesty through Indonesian language and/or vernaculars in neighbourhood activities, (3.1) to understand descriptive text on body parts and five senses, the figure and nature of things, and the exchange of day and night in Indonesian language, both oral and written, with the help of teacher or other students, in which the students may use vernacular vocabulary; indicator: to read text on musical instruments made of bamboo as it can be easily found on the way home / to school, and (4.1) to observe and practice descriptive text on body parts and five senses, the figure and nature of things, and the exchange of day and night individually in Indonesian language, both oral and written, in which the students may use vernacular vocabulary; indicator: to retell the activities of playing music related to the teacher's explanation on musical instruments made of bamboo and glass.

There are different contents of Mathematics subject in the Main Competences, which are: (1.1) to admit, practice, and respect the religion the students believe in, (2.1) to obey the rules on addition and subtraction operation in regards with different numerical value, (3.1) to acknowledge the numerical symbol and describe number in simple utterance; indicator: to write numerical symbol related to the story of the number of bamboo cluster in the forest, and (4.1) to mention real number to 99 as the answer to addition or subtraction operation between two real numbers with other possible answers; indicator: to solve the subtraction operation 21-40 by counting down the number of bamboo cluster in the forest.

Activity 3

There are different contents of Indonesian language subject in the Main Competences, which are: (1.1) to admit that Indonesian language is a God's blessing which is also known as national language and is a subject of learning among various vernaculars, (2.5) to maintain good behaviour and honesty through Indonesian language and/or vernaculars in neighbourhood activities, (3.1) to understand descriptive text on body parts five senses, the figure and nature of things, and the exchange of day and night in Indonesian language, both oral and written, with the help of teacher or other students, in which the students may use vernacular vocabulary; indicator: to identify different things in the forest, such as pumpkin, bamboo, leaves, trees, dew, hot air balloon, and (4.1) to observe and practice descriptive text on body parts and five senses, the figure and nature of things, and the exchange of day and night individually in Indonesian language, both oral and written, in which the students may use vernacular vocabulary; indicator: to answer written questions related to the storyline of "The Garlic and the Onion".

There are different contents of Civics Education subject in the Main Competences, which are: (1.1) to admit the diversity of religious life in school and neighbourhood as an evidence of God's blessing, (2.3) to express togetherness within diversity in school and neighbourhood, (3.3) to acknowledge the diversity of individual characteristics in school and neighbourhood, indicator: to recognize the diversity of individual characteristics through storytelling activity in terms of the different personalities of The Garlic and The Onion within the story "The Garlic and the Onion", and (4.3) to observe and describe togetherness within diversity in school and neighbourhood; indicator: to discuss living in harmony based on the storytelling activity related to the concept of living in harmony which causes a happy ending story.

There are different contents of Physical Education subject in the Main Competences, which are: (1.1) to respect human body with all its parts and their ability as a God's unlimited blessing. (2.1) to maintain confidence in any physical activity in form of sport game, (3.1) to discover body parts and their functions; indicator: to distinguish the concept of balanced and fast motion related to the storyline of "The Garlic and the Onion", which is balanced motion along the bridge and river bank,

and (4.1) to practice physical activities for balance and mobility of the body through simple sport game; indicator: to practice the concept of balanced and fast motion related to the storyline of "The Garlic and the Onion", which is balanced motion along the bridge and river bank.

Activity 4

There are different contents of Indonesian language subject in the Main Competences, which are: (1.1) to admit that Indonesian language is a God's blessing which is also known as national language and is a subject of learning among various vernaculars, (2.5) to maintain good behaviour and honesty through Indonesian language and/or vernaculars in neighbourhood activities, (3.1) to understand descriptive text on body parts five senses, the figure and nature of things, and the exchange of day and night in Indonesian language, both oral and written, with the help of teacher or other students, in which the students may use vernacular vocabulary; indicator: to identify the figure and nature of things found in the forest, and (4.1) to observe and practice descriptive text on body parts and five senses, the figure and nature of things, and the exchange of day and night individually in Indonesian language, both oral and written, in which the students may use vernacular vocabulary; indicator: to guess the right words through its characteristics, related to things found in the forest, such as bamboo.

There are different contents of Mathematics subject in the Main Competences, which are: (1.1) to admit, practice, and respect the religion the students believe in, (2.1) to obey the rules on addition and subtraction operation in regards with different numerical value, (3.1) to mention real number to 99 by counting the things found in school, neighbourhood, or in the playground; indicator: to write numerical symbol as the correct answer to subtraction operation in regards with various plants found in the forest, and (4.1) to mention real number to 99 as the answer to addition or subtraction operation between two real numbers with other possible answers; indicator: to solve subtraction in vertical method in regards with various plants found in the forest.

There are different contents of Art and Culture Education (*SBdP / Seni Budaya dan Prakarya*) subject in the Main Competences, which are: (1.1) to feel the beauty of nature as an evidence of God's mighty power, (2.2) to acknowledge the inspiring beauty of surrounding nature in art-making process, (3.4) to observe various materials, tools, and their

functions in making art crafts; indicator: to describe the materials and tools used in making clay crafts made of flour through the teacher's explanation in regards with the story of cake made of pumpkin, and (4.4) to create expressionist art craft out of dough in regards with the story of moulding pumpkin dough into different shapes of pumpkin cake.

Activity 5

The content of Indonesian in Basic Competence 1.2 accepts the existence of The Almighty God for the creation of humans and a variety of languages as well as objects in the environment. The Basic Competence 2.5 contains a polite behavior and honest in terms of activities and games in an environment through the utilization of Indonesian and / or the local language. Basic Competence 3.4 recognizes personal story text about the existence of the family with the help of a teacher or a friend in the Indonesian language spoken or written that can be filled with the vocabulary of regional languages to help understanding with indicators such as simple text silent reading that is associated with the content of a story based on the friendship of The Onion and The Garlic, and Basic Competence 4.4 delivers personal stories text about family independently in Indonesian orally and in a written form that can be filled with the vocabulary of regional languages to help the presentation of the indicators form a sentence of new words which are associated with new sentences and words in Onion and Garlic.

Mathematical content in Basic Competence 1.1 receives, runs, and appreciates the teachings of religion, 2.1 shows submissive behavior on the rules of doing addition and subtraction of appropriate procedures / rules with regard to the value of tens and units, 3.1 recognizes the natural numbers up to 99 using objects around the house, school, or playground with indicators of writing numeral emblem in the form of a description of a number into two numbers correctly attributed by parsing the number of bamboos in the story of Red Onions and white, and 4.1 Parsing natural numbers up to 99 as a result of addition or subtraction of the other two natural numbers with a variety of possible answers with indicators of outlining a number into two numbers which are linked by parsing the number of bamboos in the story of Onion and Garlic.

The content of PPKN in Basic Competence 1.1 accepts individual characteristics diversity within life with religion as a gift from the God around the house and school. Basic Competence 2.3 shows togetherness attitude in diversity around the house and school. 3.3 Acknowledges at home and school with indicators to idenfity individual differences by visiting a friend which is related to

the characteristics of the characters, The Garlic and The Onion and Basic Competence 4.3 observes and tells togetherness within diversity at home and at school with indicators describing differences related to the house of The Garlic and The Onion with the house of a lady in the woods.

Activity 6

The content of Indonesian Basic Competence 1.2 accepts the existence of The Almighty God for the creation of humans and a variety of languages as well as objects in the environment. Basic Competence 2.5 has polite and honest behavior in terms of activities and games in an environment through the utilization of Indonesian and / or the local language. Basic Competence 3.4 recognizes text stories about oneself about the whereabouts of the family with the help of a teacher or a friend in Indonesian orally and in a written form that can be filled with the local language vocabularies to assist understanding of the indicators to read text that is associated with the story which is the text of Onion and Garlic and Basic Competence 4.4 delivers personal text story about the family independently in Indonesian orally and in written form that can be filled with the vocabularies of local languages to help the presentation of the indicators write a short story about the experience done with friends as much as 20 to 50 words associated write fraternity the sisterhood of The Garlic and The Onion.

The content of PJOK Basic Competence 1.1 appreciates the body with all of the movements and its ability as a gift from God that is invaluable. Basic Competence 2.1 shows the behavior of confidence in a variety of physical activities in the form of games. Basic Competence 3.7 knows the difference of moving in the water and on land in water activities with the indicators of observing sliding motion associated with stepping down the bridge leading into the forest and Basic Competence 4.7 practices various forms of games with the introduction of water gliding motion practice indicators associated with the motion of stepping down the bridge into the forest in the story.

RESULTS AND DISCUSSION

Elementary age students are in concrete operational development stage. Students will easily understand if the learning is presented concretely. Piaget (in Desmita, 2009: 25) states that cognitive development occurs during four stages, namely sensorimotor, preoperational, concrete operational and formal operational. First grader of primary school child is still in the development of concrete operational level. Piaget (in Desmita, 2009: 98) states that during the stages of cognitive development of children aged 7-11 years who are in elementary age levels, the child can think logically about concrete events and classify objects into existing forms.

In this case, the literature story of Onion and Garlic explain and the create language environment. Through the literature story of Onion and Garlic, students can develop language skills, ie reading, writing, listening and speaking. Elementary age is an age when language is developed creatively. Robert E Quens (in Triyono et al, 2012: 135) states that the school age is a period of very creative language development. The literature story is created in the choice of words which are easy to understand by the students and is concrete. Rumidjan (2013: 24) states that concrete word is a word that can be captured by the senses that enable the emergence of the imagination. Exposed vocabularies which are repeated deliberately are intended to create a language environment that allows the students to recognize those vocabularies. Simple exposure of sentence follows simple sentence plot, so that the students are easy to understand the contained meaning. Simple sentence level are the subject, predicate and description.

The story book is created in great shape with illustrations based on the level of mental development of children of primary school age who enjoys colorful illustrations. The cover story is created with pictures representing the contents of the story. The Garlic's and Onion's cover is packed with a picture of a beauty. Sumanto (2011: 96) explains that the illustration is interpreted as everything functioned to explain, animate, and beautify life stories, events, and so forth. The illustrations are the types of images created to explain a story, moreover it functions to clarify the contents of the story and the illustration also provides traction or decoration display of the storybook.

The story of The Garlic and The Onion is simplified in accordance with the moral and language development of children's first grader and is packed as follows.

The language simplification is tailored to the language development of children of primary school first grade. Thus, they will easily understand the story.

a. The Garlic and The Onion go into the woods.
b. The Garlic helps old lady who slipped in the forest.
c. Old lady thanks her and gives pumpkin to The Garlic.
d. The Garlic splitting out pumpkin and there is golden dust.
e. The Onion envies and goes alone into the woods.
f. The Onion help the old lady in the forest.
g. The Onion asks pumpkin as her reward.
h. The Onion is splitting the pumpkin and there are small caterpillars.
i. The Onion apologizes to Garlic saying the words "please forgive me"!

CONCLUSION AND SUGGESTIONS

The literature content of The Garlic and The Onion fulfills map elements of children's stories including elements of plot or storyline, clarity of characterization, concrete exposure story, which corresponds to the maturity level of the student's thinking, as well as sharpen social sensitivity, moral and feelings. In addition, the story of The Garlic and The Onion also trains the children to communicate. Literature story titled The Garlic and The Onion enables the mindset of children in a way to predict or to explore the content of the story. The story titled Garlic and Shallots proves to be very effective for use as a landing alternative fulcrum for integrating the content of thematic learning for first grade students.

The literature story contains the aesthetics content, enabling teachers to relate it to the core competences 1 which are associated with a spiritual aspect to be grateful for the grace of God and core competencies 2 in curriculum 2013 related to the social and moral associated with sincerity in helping others, not expecting rewards, and the willingness and humility to want to apologize.

Literary language is presented in accordance with the level of thinking of children with exposure to a language that is not too long (subject, predicate, and object). Presentation of the story titled The Garlic and The Onion is presented in accordance with the level of social and emotional development, accuracy of grammar and spelling, message understanding, terms standardization, and integrity that builds language exposure as a whole grain. Proper and correct exposure of language provides optimal language environment, and delight children of primary school age.

Attractive illustrations, colorful and appropriate level of elementary school age children development are in great demand and present a fun learning. Illustration cover image depicting the story optimize the imagination of the students and motivate students to think critically and creatively.

Primary school teachers are advised to (1) not only orient learning on teachers and students use to the book alone, (2) primary school teachers are expected to improvise the learning by using fulcrum landing which is for fun elementary school age students.

MANAGEMENT ANALYSIS OF FACILITIES AND INFRASTRUCTURE AT *SEKOLAH DASAR NEGERI* 013 TARAKAN

Ratna Yulinda; Muhsinah Annisa

University of Borneo, Tarakan

Email: echa.ok@gmail.com

ABSTRACT

The purpose of this study was to analyze the feasibility of educational facilities and infrastructure at SDN 013 Tarakan based on national education standards. A qualitative case study methodology was employed. The SDN 013 Tarakan was the study subject. Data about the types of facilities and infrastructure owned by SD Negeri 013 Tarakan were the study data. The study data was collected from interviews, observations and analyzing the documents about facilities at SDN 013 Tarakan. The observation sheet and interviews were used in this study as instruments. In this study, in analyzing the data the researchers performed stages of Miles and Huberman. In reducing the data, researchers selected, focused, simplified, made abstraction and transformed the data that was collected from observation sheets, interviews and document study. The study findings were reviewed by researchers to get conclusions and verification on facilities at SDN 013 Tarakan. The investigator triangulation and theory triangulation were used as the triangulation in this study. Researchers built validity from the experts and reviewed the theory on government regulation number 24 of 2007 concerning the standard of facilities and infrastructure to be analyzed its feasibility.

Keywords: *facilities and infrastructure, national education standards, elementary school*

Tarakan is the only city in north Kalimantan bordering with neighboring countries, namely the states of Sabah and Sarawak, East Malaysia. Tarakan has port for import and export and international airport of C-class used as a transit point and goods distribution between cities and even countries, namely Indonesia and Malaysia. Its existence makes a natural thing to Tarakan City to have rapid growth in economic, social and educational.

Education is one of factors to assess a nation progress. Education is identical to current development, and science competition. Many areas have developed because its people have good education. As a growing city, Tarakan prioritizes education to its people. Education can also build a person's identity, furthermore, is an investment in the future. However, the investment will be felt by the people not in the short term, but it will be felt after ten or twenty years later. Therefore, education is one of factors in supporting the region to continue to develop and progress, as mandated by the Government through the Ministry of National Education that it is committed to improving the quality standards of education in Indonesia.

Education would be well held, and could achieve national education goals as mandated in the Government Regulation No. 19 of 2005 on national education standards if eight national education standards had been implemented in the education unit of each school. Eight of these standards include graduation competency standards, content standards, processes standards, educator standards, facilities and infrastructure standards, management standards, financing standards, and assessment standards. The eight standards mutually support each other in achieving national education goals.

Educational facilities and infrastructure are one of the important supports in implementing the teaching and learning process in schools. Without supports from adequate facilities and infrastructure, expectation on high quality of implementation process and educational outcomes could not be achieved. The low quality of process and outcomes in education in Indonesia at this time are allegedly caused by the lack of educational facilities provided by the government and the community. Meanwhile, the lack of educational facilities availability and infrastructure availability are not only caused by the inability of the community or the government, but also caused by the unidentified essential educational facilities that needed by school consequently the educational process could not take place optimally. To that end, every educational institution should have good facilities and infrastructure management

including planning, procurement, utilization, maintenance and supervision. This is in line with study from Handayani (2016) stated that the facilities and infrastructure could be a contributing factor to the acquisition of high quality graduates in SDN 013 Tarakan.

Based on this background, it is needed to study the feasibility of educational facilities and infrastructure in Tarakan to have policy improvement in particular to comply with national education standards on facilities and infrastructure standards to improve education quality in Tarakan.

METHOD

A qualitative case study methodology was employed. Gay (1976) stated that qualitative research was to collect, analyze, and interpret comprehensive narrative and visual data to obtain conclusion on particular phenomena for the purpose of a deep understanding of environmental phenomena, processes, and trust. Furthermore, Bogdan (1992) mentioned five characteristics of qualitative research: Qualitative research has a natural setting as the direct source of data and researcher is the key instrument to describe the results using inductive data analysis with the essence of meaning from qualitative approach. Researchers concluded the research design is a qualitative descriptive concluded from the data collected for this study, namely qualitative data in the form of interview and observation data concerning facilities and infrastructure in SDN 013 Tarakan.

The SDN 013 Tarakan was the subject of this research. The data concerning the types of facilities and infrastructure owned by SD Negeri 013 Tarakan was the data of this research. The observation sheet and interviews were used as instrument in this research.

Interviews, observation and analyzing document of facilities in SD 013 Tarakan were employed as data collection techniques by researchers. In research design, it is mentioned that the design of this research is descriptive qualitative. Miles and Huberman (1984) explained that the design of this study presents more data in the form of descriptions using words than data in numeric form.

In this study, researchers conducted stages from Miles and Huberman to analyze the data. In data reduction, researchers selected, focused, simplified, make abstraction and transformed data that had been obtained from observation sheets, interviews and document study, and then researchers would review the research findings in order to draw conclusions and verification on facilities in SDN 013 Tarakan.

Guion (2002) stated that triangulation was a method used by qualitative researchers to check and build validity. There are five types of triangulation: data/resources triangulation, investigator triangulation, theory triangulation, methodology triangulation, and environment triangulation.

In this study the employed triangulation was investigator triangulation and theory triangulation. Researchers build validity from the experts and the researchers also review the theory on Government regulation number 24 of 2007 concerning the standard of facilities and infrastructure to be analyzed its feasibility.

FINDINGS AND DISCUSSION

Activities concerning facilities and infrastructure management in SDN 013 Tarakan consist of 7 elements: The first element is to make a plan on RKS (School Activity Plans). Second element is to engage the procurement and making reports. Third element is to inventory the facilities and infrastructure. Fourth element is to do maintenance, and Fifth element is to supervise. Sixth element is to be accountable, in this term the school should make a report and in managing the facilities and infrastructure the school should have facilities and infrastructure information system namely using application information system or such as databases. Seventh element is to delete, the school should not perform any deletion and deletion element should not be done by the school but it should be done by DP2KA (Department of Revenue, Finance and Asset Management).

In procuring facilities and infrastructure, the school should apply principles that include accommodate the procurement proposal from various sources (teachers, educators, school committees, stakeholders), adapting to the needs analysis that was made previously and put more prioritize to facilities that did not available, adjusting the needs of new facilities and infrastructure to the available budget, planing the need on facilities and infrastructure within a minimum period of one year, making the priority scale on procurement of infrastructure listed in RKS (School Activity plans), deciding the plan that are listed in

RKS (School Activity plans), using procurement method such as to buy directly from the store, factory, or producer. In terms of these principles, SDN 013 had already applied the principles in providing its facilities and infrastructure.

In distributing facilities and infrastructure, schools apply the principles that include the inventoried facilities and infrastructure and then distributed it in accordance to its uses, in using the facilities and infrastructure, an efficient and effective principles should also be followed. When the total facilities and infrastructure are less than the users the use should be organized and the teachers are usually the persons who decide it, and the quickest person is the first person who can use it while the others should succumb. As for the principle that is not applied by the school is the usage or the application of school facilities and infrastructure with SOP (Standard Operating Procedure), electronic equipment and other devices that are expensive and relatively difficult to be operated and clear information on how to use it is needed.

As for the maintenance conditions for facilities and infrastructure that are performed by the school should be held on a regular basis namely once in a year, without paying any attention to the school calendar, without paying any attention to nature of maintenance categories such as checking, preventing, minor repairs and heavy repairs, the maintenance of school's electronics facilities and infrastructure should never buy any new spare-part, and replacement with the new program specification/new tool to keep up with the newest progress by directly buying a new tool. Deletion of infrastructure and facilities in SDN 013 Tarakan has not been done and the deletion is not performed by the school authorities but DP2KA.

The minimum ratio of land area in SDN 013 Tarakan against students is 6 m2/student, the ratio is in line with the SNP based on Government Regulation No. 24 of 2007 stated that if 13-18 learning group with 2 floors was available then the minimum ratio of land area should be 5.6 m2/student, then we conclude that the minimum ratio of land area in SDN 013 Tarakan to students which is 6 m2/student is exceeding to the provisions in Government Regulation minimum ratio namely 5.6 m2/student, therefore it is in accordance with the SNP. The minimum land area of SDN 013 Tarakan namely 2993 m2 is in line with the ratio from

SNP based on Government Regulation No. 24 of 2007 when as many as 13-18 learning group is available with 2 floors then the minimum ratio should be 1690 m2/student, we conclude that the minimum ratio of land area against students at SDN 013 Tarakan is 2993 m2/student and it exceeds the provisions in the Government Regulation namely with minimum ratio 1690 m2/student and it is in line with the SNP. SDN 013 Tarakan is not hiring from any parties, but the elementary school is on loan from Tarakan city government.

Land area of SDN 013 Tarakan meets the government requirement in terms of location namely it is located in a safe location, it has ease access, avoided from potential hazards that could threaten the physical health, avoided from potential safety hazards to the soul, away from the water pollution disturbance, away from air pollution disruption, away from soil pollution disturbance, away from noise nuisance, and it has access to a rescue in an emergency situation. The school is located in accordance with the designation location, it has legal status of land rights, it has license to exploit the rights from the holder of the land right, and it has building permits.

For a minimum ratio of floor area in SDN 013 Tarakan against its students is 4 m2/ student, the ratio is in line with the SNP based on Government Regulation No. 24 of 2007 stated that if 13-18 learning groups are available with 2 floors then the minimum ratio should be 3.4 m2/student, we conclude that the minimum ratio of floor area in SDN 013 Tarakan against its students which is 4 m2/student has exceeded to the provisions in Government Regulation namely the minimum ratio is 3.4 m2/student, therefore it is in accordance with the SNP. As for minimum ration of floor area of the building for SDN 013 Tarakan namely 1784 m2 is in line with the ratio of SNP based on Government Regulation No. 24 of 2007 stated that if 13-18 learning group with 2 floors then the minimum ratio should be 1010 m2/student. We conclude that the minimum ratio of floor area of the building against student at SDN 013 Tarakan namely 1784 m2/student has exceeded to the provisions in the Government Regulation namely the minimum ratio is 1010 m2/student, therefore it is in accordance with the SNP.

The conditions of school building are equipped with stable structure, sturdy,

lightning rod, however it is not equipped with fire hazard prevention system. SDN 013 Tarakan's sanitation meet the health requirements that include the availability of sanitation inside and outside the building to meet clean water needs, it is provided also with sewer and/or waste water, a sufficient amount trash can, rainwater drain. The school building is also installed with adequate air and lighting ventilation. It has electrical installations with more than 900 watts of power namely 5625 watt. It has also facilities and infrastructure in accordance with the provisions namely as many as 13-16 facilities and infrastructure, however from the total of 16 facilities and infrastructure, there are some of infrastructures that are not owned by SDN 013 Tarakan namely laboratory and UKS (Student Health Unit) room, as for washbasin facilities in front of each class with flowing water are not available in front of all class.

The school has classrooms that meet to the provisions namely one classroom for one learning group with minimum size of classroom 56 m² (7 m x 8 m). The total students per class is 30 students where every classroom is facilitated with complete and in good condition furnishings/ meubel air, however some classrooms do not have a closet, a display board and storage rack to display students' work, as for washbasin, it is only available in some particular places. The classrooms are facilitated with adequate ventilation and lighting. The classrooms conditions are clean, tidy and well-groomed/well-maintained, the classrooms also have room inventory card.

The school has teacher room that is in accordance with the provisions size namely the total area minimum room of 56 m², where the total area of teachers' room at SDN 013 Tarakan is 78 m² therefore it meet the requirement. It also has complete and in good condition furniture/meubel air with adequate ventilation and lighting, clean condition of the room, tidy and well-groomed/well-maintained, the classrooms also have room inventory card.

School has one school principal room that is in accordance with the provisions of the minimum size of room namely 21 m², however the principal's room is only 20 m² therefor the condition is not met. The room's furniture/meubel air is complete and in good condition. It has no ventilation for the use of air conditioning however it has adequate space lighting. The condition of the principal's office is well-groomed/well-maintained and it has a room inventory card.

School has a library in accordance with the requirements stating that the library room serves as activities location center for both students and teachers to get more information on various types of library materials by reading, watching, and/or hearing. The minimum area of library space is equal to the area of the classroom namely minimum 56 m² (7 mx 8 m), however the minimum width of library room is 5 m. The library room is facilitated with windows to provide adequate lighting to read books. The library room is located within easy reach in the school. The school library is equipped with the following means, namely textbooks, handbooks for teacher, enrichment books, reference books, other learning resources; furniture: bookcases, furniture such as: read table, work chair, work/circulation desk; furnishings: cabinets, and multimedia table; equipment: inventory book, lending book, guest book, books; equipment: trash, contact box, clocks. However, the library has no furniture such as: magazine rack newspaper rack; and it also has no educational media: multimedia equipment (TV, VCD, tape recorder, radio, etc.). The terms of use of library as a learning resource for SDN 013 Tarakan has met the requirement because it has a utilization schedule, used by the principal, teachers, students, and used by educational staff.

The terms of UKS in SDN 013 Tarakan include beds, medical equipment, medicine boxes and its contents, provided with washstand/ washbasin, posters/pamphlets/ leaflets/ information concerning health issues, work program of UKS, executive team for UKS, room inventory cards, notebook for recording UKS activity, reference books to go to the community health centers (puskesmas), and the UKS room condition is clean and well-maintained.

CONCLUSION

Terms of the worship room at SDN 013 Tarakan include worship equipment, a place to take holy water, adequate ventilation and lighting, a room inventory card. The worship room condition is clean, tidy, and well-maintained. The school has worship room that is used and meet the following requirements namely it is used for the implementation of worship. However, the room can't be used for religious festivities

because the total member of school community is greater than they should be, therefore it cannot be used for religion festivities. The worship room is used by the school residents and/or community. The use of the worship room is optimal because it has adequate size to be used by the users.

Toilets at SDN 013 Tarakan have met the requirements, namely: it has clean water, clean toilets, and odorless, however there are some toilets that has bad smell. The toilet ratio is 1 toilet for 32 students, where student toilet are separated between male student and female student, as for teacher toilets are also separated between male and female teacher. The toilets are also equipped with dipper, soap, trash.

The schoolyard at SDN 013 Tarakan has met the requirements that include a clean and well maintained yard, planted with cover crops, school garden, equipped with organic and inorganic trashcan, washbasin with running water, the space is adequate for the use of all students. The school has yard and it is used for activities: ceremony, exercise, playing facilities of students and extracurricular activities.

School do not have laboratory of Natural Sciences (IPA) but it has some IPA means such as KIT and torso that are kept in keterampilan room.

School facilitates props/practice tools for learning with conditions: mostly are made by the student/teacher, tools are made from materials that are easy to obtain, and it has cheap price, the props are also purchased as needed.

School has not taken advantage on school gardens as a source of learning, the school garden has not planted with various plants of living pharmacy, the school garden has not planted also with a wide variety of horticultural crops (vegetables) however, SDN 013 has hydroponic gardens that are planted with cabbage. The school garden is clean and well-maintained.

School warehouse meet the requirements: The warehouse serves as a place to store learning equipment outside the classroom, the warehouse also serves as a temporary store of school supplies that do not/does not work, the warehouse also serves as a place to save school archives that older than 5 years. The warehouse area at SDN 013 tarakan is 21 m2, the warehouse can be locked, and sufficient wardrobes to store tools and archives are available, however, the wardrobes are in poor condition, not strong,

not stable, and not secure. Adequate racks to store equipment of sports, arts, and craft shelves are available in good condition, strong, stable, and secure.

Circulation room in SDN 013 Tarakan include: horizontal circulation room works as a liaison between the rooms inside the school building, the horizontal circulation room is roofed, and got adequate lighting and air, horizontal circulation room serves as a venue for playing and social interaction between students outside hours lesson, the horizontal circulation room also serves as a shelter during rains when such activities does not allow to take place in the classroom or in the school yard, the horizontal circulation room has minimum area of 30% of the total area of the entire space in the building, the minimum width is 1, 8m, and has a minimum height of 2.5 m.

Playground/gym in school also meets the requirements, namely: the playground/gym serves as a play area, exercise, physical education, ceremonies, and extracurricular activities. The minimum ratio of playground/gym area is 3m2/students. If the total students are less than 180 students, the minimum area of a playground/gym should be 540 m2, however, the total area of yard in SDN 013 tarakan is only 504 m2 with minimum ratio area of playground/gym is 1m2/students, and therefore the minimum ratio of land area is not met. Within the area, a place to do exercise is available with minimum size of 20m x 15m with a flat surface, good drainage, and no trees, waterways, and other objects that could disturb the exercise. Some of the playground area is planted with greening trees around the field or at the edge of the field, and it is put in a place with minimum interference to the learning process in the classroom, and it is not used as parking lot.

School provide books for management activities of facilities and infrastructure consisting of: Expedition Book, Administration Library Book, Structure of School Organization, Job Description of Teachers and Education Staff, Meeting Agenda Book, Meeting Minutes Book, Inventory Book for Facilities and Infrastructures, Reports Book for School Infrastructure, Reports Books for Educational Facilities/School Inventory, Examination Book for Facilities and Infrastructures.

DEVELOPING MORAL-LITERACY GUIDANCE PACKAGE FOR JUNIOR HIGH SCHOOL STUDENTS

Rofiqah
SMK Negeri 10 Malang
Email: rofiqahrosidi@gmail.com

ABSTRACT

Concerned with the moral problems of the youth, it is necessary to provide moral guidance service as an integral part of school guidance and counseling program in junior high school. Such service completes the conventional program of school guidance and counseling that covers learning, career, personal, and social problems of the students. This idea is, however, difficult to be applied since the materials is still unavailable. This project was intended to develop a prototype and examine the effectiveness of moral guidance package. The model of development that is applied in this project is the combination of the Systematic Instructional Design and the model of Educational Research and Development. Substantively, the prototype of the package covers universal moral values and instrumental moral values. The package is, therefore, is not only intended to help the students in learning the moral values, but also to develop their capability of moral reasoning, to stimulate their moral intuition responsiveness and their moral emotion sensitiveness.

Keywords: *moral literacy, moral reasoning, moral intuition, moral emotion, guidance and counseling package*

The problems of morality is not only faced by adults but also the teenagers. From time to time, the problems of morality among teenagers tend to proliferate qualitatively or quantitatively (Dina, Puspita, Tanjung and Widiastuti, 2001; Pribadi, 2003; Rofiqah, 2005). Correspondingly, a survey located in suburb demonstrates a very horrible description about the morality of adolescents now (Masngudin, 2006).

With 40 respondent aged 13-21 years old, the juvenile delinquencies are divided into three types, i.e.: (1) ordinary delinquency such as prevaricate, going out from house without permission to their parents, hanging around, fighting, littering, etc. (2) delinquency offenses and crimes such as driving without a driving license, exceeding speed limits, sneaking, and consuming alcohol, and (3) special delinquency such as sex before marriage, free sex, drug abuse, involving in a murder case, rape, and abortion (Masngudin, 2006).

It was reported that all respondents have ever carried out ordinary delinquency such as prevaricate. It indicates that the tendency of being honest has diminished. The delinquency that tends to be an offenses and crimes were also pretty much performed by the respondents, even the special delinquency which shows the decline of responsibility among the teenagers now.

All the phenomenon are the issues and challenges that has to be figured out and answered by serious efforts. If it is expected to result a perceptive outcome on the cases and requirement of the time, then the attempt to optimize the establishment of moral personality should also chew over the issues and the requirement of the time. That is to say that when the challenges and the requirements of the time are fluctuating, then the content, approach, and method of moral learning also require an improvement since the old approaches are considered inadequate to meet the challenges and the demands of the time.

As stated by Rogers (1977: 186), every step of a new history sets up new developments that require reorientation of set of value and morals to work for the community.

> Nevertheless, one generation cannot hand down already-made set of values to another. For each new stage in history brings new developments wich require a reorientation in morals and values, in order that they properly serve the society that created them (Rogers, 1977: 186, in Budiningsih, 2001).

Related to the assurance of change required the reorientation of morals and values, there have been many occurrences of moral dimensional published, the moral concerns voiced, and thediscourse of moral counselling developed. Besides the creations categorized as the materials from the review of philosophy and religion also published some books about moral learning (Budiningsih, 2004).

In accordance with the urge that schools should be concerned on the students' ability of moral reasoning, Rosjidan (2004: 1) suggested that the counselling consisting of four fields i.e. personal, social, study and career needs to be enhanced with moral lecture so that there will be five fields of lecture. Perceiving from the purposes, the urges and suggestions direct to the formation of Tuana (2003: 2), therefore, the adolescent not only literate in reading, writing, and arithmetic but also literate in moral literacy to be able to (1) assure that the moral issues could be knowledgeable, (2) rise the mortal virtue, and (3) develop the skills of moral reasoning.

As the development, this project formulate as the disparity between expectation and phenomenon. When the moral lecture is one of the indispensable services, there are no references in the form of an examined moral learning package and can be applied by the school counsellor. Therefore, this activity aims to: (1) composing the moral learning package for the students in junior high school based on methodological approaches of learning package development and (2) examine the usage, quality, and assurance of moral learning package for the students of junior high school based on experts, users, and the target students.

If the awareness and or the literate of morality are assigned as one of the lecture's purposes for the students then there are some theoretical model available as the foundation. Commonly, there are three theoretical models of moral consideration, i.e.: rationalist model, intuitionist model, interactionist model. All models assign the moral emotion as the additional process, therefore, the moral emotion model is not stated. For the development of moral lecture program, the realistic and practical implication theoretical model must be selected.

As stated by Wright (2005: 2), there are two main models of moral consideration, i.e.:(1) rationalist model, and (2) intuitionist model. Besides Piaget (1932) that was known as the founder of this model, but lately Kohlberg (1977) is known as the main model of rationalist while Haidt (2001) and Mikhail (2002) are known as two main models of intuitionist.

According to Haidt (2001: 814), the researches about the moral consideration has been dominated by rationalist model. In accordance with rationalist model, moral judgement is caused by moral reasoning. Meanwhile, intuitionist model does not emphasize on the personal moral reasoning but on the significance of social culture impact. According to intuitionist model, moral consideration is the result of a quick and an automatic assessment. Although the intuitionist model is portrayed as the alternative of rationalist model, primarily it is still acknowledged that in reality, the moral consideration includes rational reasoning or affectual intuition. Thus, it is demanded a model integrated between rationalist and intuitionist model.

The endeavour to integrate two models of moral consideration was conducted by Anderson (2004) and Wright (2005). The findings of the research by Anderson (2004) assists the interactionist perspective that advance the participants of the research to employ intuition and reasoning differently rely on the assessed dilemma.

> The findings support the interactionist position by suggesting that participants used intuition and reasoning differently depending on the dilemma being judged. In situations that were predicted to require reasoning (no-intuition dilemmas and strong conflicting intuition dilemmas), participants did poorly in the fast time condition. However in the dilemmas when reasoning was hypothesized to be causally inert (noconflicting intuition dilemmas), there was no difference in participants' performances between the time conditions. These findings call into question both strong intuitionist and strong rationalist positions but support the dual-process interactionist model (Anderson, 2004: 4).

Cushman, Young and Hauser (2006: 1088) conclude that their research assist the multi-system model. This model not only comprise conscious reasoning but also moral intuition. Therefore, the perspective is rigorous in the circle of rationalist or intuitionist, it is not supported by the research they conducted.

> In conclusion, this article has outlined a novel methodological approach to the study of moral psychology, highlighting the interaction of intuition and conscious reasoning and emphasizing the distinction between the principles that people use and the principles that people articulate (Cushman, Young dan Hauser, 2006: 1088).

Based on some issues from rationalist, intuitionist, and interactionist circumference, Wright (2005) formulates an expertise model. Besides integrating the factors of

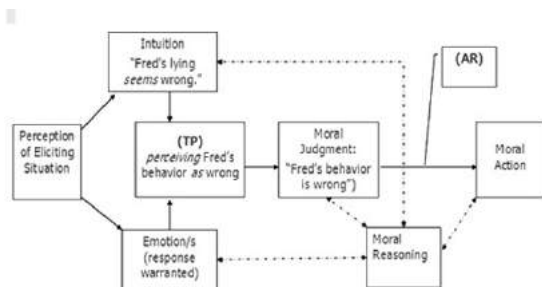
rationalist model and intuitionist model, the expertise model indicates two processes, i.e.: trained perception and automatic responsiveness. The trained perception is a process by complex stimulative patterns, the compiler characteristics or substantial specimen, direct (not inferentially) perception. The automatic responsiveness is a process of actively and adaptively work by itself in every problems faced in order to constantly convenient with the situational characteristics activated them. To provide more complete description, skill model is presented as follows (See Figure 1).


Figure 1 Moral Skills Measures Model (Wright, 2006: 23)

The process begins when the individual moral action saw a situation that provoked moral dilemmas (perception of eliciting situation). Soon after, in the individual lasts two events, namely: moral intuitions and moral emotions in the form of a justified response. These two simultaneous events will form a particular view. The trained perception (TP) by Wright (2005) was stated that it would otherwise be in direct contact with moral considerations. Meanwhile, since the second process actually took place of moral reasoning that assists moral considerations. Finally, before individuals make a decision to carry out morally, there is an automatically responsiveness inside themselves.

Anderson (2004: 16) aligned with Wright (2005) provide a more coherent explanation. First, as soon as an individual is conscious about the moral dilemma, a moral intuition is activated. A moral intuition is further supported by the moral reasoning. The moral intuitions could also be modified by moral reasoning with the aim of correcting some skewness occurs. When two or more conflicting intuitions are activated, then the moral reasoning will make a decision between them. Finally, when the intuitive response does not appear in the

individuals' mind, then an assessment is produced by the moral reasoning.

A review of the variety of moral guidance approaches demonstrate three approaches that are developed and implemented up to now. Each of these is an authoritative approach, a liberal approach, and a value clarification approach. First, an authoritative approach is known as a moral teaching approach, because educators are placed as interested parties to transmit moral values which they respect, while the students are seen as the party needed to receive then practice the moral teaching.

The second approach, the opposite of an authoritative approach, was carried out by parents or educators to give full freedom to the children as students to figure and determine their own values. This method often creates inner conflict for the children since they have to determine in the confusion, one or more of a variety of values developed in the community.

The third approach is by value clarification technique. This approach is the approach for the determination of the value that is perceived by the experts could overcome the deficiencies existed in two previous approaches. In the process of value clarification, students are actively involved, students develop an understanding and familiarity of the personal values, make decisions and act in accordance with the decisions taken. The role of mentor is as facilitators who work to stimulate and encourage the students.

Hart (1978: 8), citing a number of researchers had previously explained that there are three stages in the clarification of values, i.e.: choosing, prizing, and acting that reflects a sequence of introduction process, refinement and implementation.

METHOD

This educational development combines a systematic learning ideas of Dick and Carey (2001) with a model of Research Development Education notion, Baker (1971). The results of the model and its blend of operational procedures undertaken in the development of the following unravel.

After taking a few steps of pre-development, development stage prototype is done in seven steps, namely: (1) formulating general purpose guidance, (2) analyzing the guidance, (3) analyzing the context and characteristics of students, (4) formulating specific goals guidance, (5) developing

assessment instruments, (6) developing counselling strategies, and (7) the developing and selecting guidance material.

The assessment phase, prototype testing and refinement of moral guidance package is done in two stages, namely: (1) the stage of pre-assessment and improvement of the field, and (2) the stage of field testing and post repair field. Some experts that are involved in the assessment of prototype moral guidance package are: philosophers, experts of guidance and counselling, and experts of learning technology.

After repairing based on assessment and input from relevant experts, the guidance package prototype are tested in the field. In summary, there are three counselling practitioners who conduct field trials prototype package moral guidance to students in grade 2 junior high schools, with the number of services subject 24 students.

While testing the prototype field guidance packages are made based on data collected from students by interview, the test evaluation model used is the gap (discrepancy evaluation model) developed by Provus (1972). The model is based on a systematic approach that includes evaluation of the comparison between the performance with a standard to see if there are any discrepancies between the two or not (Popham, 1975).

Discrepancy model is applied with the steps: (1) establishing a benchmark of each component of the program system, (2) collecting data of performance component system of the program system, and (3) comparing to get the provided information and how big the gap is between the benchmark with the performance of the real component system of the program.

The data for the field tests were collected from the students who have followed the program of moral guidance. In this case the students are required to provide affective responses (interesting, fun, and exciting) as well as the strategy and moral guidance package. The analysis was carried out by using arithmetic mean test for one sample t-test. The calculations are done by using SPSS for Windows Reease 13:00. The drawing conclusion is based on the test of the tail, with a confidence level $\alpha = 0{:}05$.

FINDING AND DISCUSSION

After going through a number of testing and refinement, the end results of this development are: (1) Moral Guidance Counsellor for Junior High School students, and (2) Moral Guidance Package for Junior High School Students.

The counsellor guidance contains of: (1) Introduction, (2) Technical Instructions of Responsibility Guidance, (2) Technical Instructions of Honesty Guidance, (3) Technical Instructions of Discipline Guidance, (4) Technical Instructions of Crafts Guidance, (5) Technical Instructions of Economical Behaviour Guidance, (6) Technical Instructions of Politeness Guidance, and (7) Technical Instructions of Tolerance Guidance (Presented in 32 pages of A4 paper).

A Moral Guidance Package for Junior High School Students consists of seven fragments, namely: (1) Fragment 1 Responsibilities, (2) Fragment 2 Honesty, (3) Fragment 3 Discipline, (4) Fragment 4 Crafts, (5) Fragment 5 Economical Behaviour, (6) Fragment 6 Politeness, and (7) Fragment 7 Tolerance (Each fragment is presented between 12 to 16 pages of A4 paper).

Each fragment is presented rational, general purpose and specific purpose, the instruction of the activities implementation, the details of meetings and activities of each meeting. The main emphasis at the first meeting is the students' understanding of the purpose of activities, materials of dilemmatic, expression of feelings, and the formation of the group. The main focus at the second meeting is the students' understanding of concepts and examples of moral values, role playing, the disclosure of conscience, and the affirmation of moral decisions. The primary stress at third meeting is the evaluation of the activities of guidance, which includes answering cognitive-rational questions, and expressing their personal impressions of the activities of the guidance that they have attended.

A set of Counsellor Moral Guidance for Junior High School students and A Moral Guidance Package for Junior High School students have been developed methodologically based on the theoretical and empirical foundation, and has been assessed and improved gradually, commencing from the assessment of experts team, assessment of counselling practitioners, field limited-test, and peer assessment.

By taking into account to the applicability and the limitations of each approach of moral guidance, the authors advocate a blend model with the first step

identifying three types of processes in moral considerations. Each of these are: (1) the intuitive process, (2) the emotive process, and (3) the cognitive process. The second step is setting an intuitive process as a stage of probability.

When an individual realizes that there is a moral dilemma, then the moral intuitions do not necessarily appear in his mind. Therefore, as the third step, the author place the emotive and cognitive processes as a complement or a supplement to the intuitive process. The emotive and or cognitive processes function complementary when a moral intuition does not appear in the mind of the individual. Instead, the emotive and or cognitive function when the individual supplementary is less convinced by the results of his moral intuition, or when the skewness that requires to be corrected, or when his intuition are contradictory more than two or three (See Figure 3).

The author, as perceived from the theoretical model, believes that the process of moral considerations do not take place in a linear manner, as theorized by theoreticians of rationalists, but does not also accept the opinion of the theoreticians of intuitionists, or if there are theoreticians of emotionalists. The process of moral judgment that takes place in the human's mind is believed to be the result of a fusion between the intuitive, emotive and cognitive. Therefore, the efforts to assist the individuals in developing the ability of moral considerations are the three processes must receive attention in proportion. When an intuitive process works well, then the process of cognitive function supplementarily, whereas when the intuitive process is not working properly, then the process of cognitive function complementarily. In all likelihood of these mechanisms, the process of emotive function motivationally.

Based on the results of the analysis of the context and characteristics of students, it was revealed that junior high school students have tended to move between the habitual of verbal and visual communication. They have started to leave the comic kids which put forward the pictures, but have not yet fully accustomed to absorb verbal information from the article. Therefore, this guidance package follows the pattern of storytelling for teenagers (Junior High School Students) that is the mix between the posts verbal and the visual image. Illustration with pictures and descriptions of the sentences are

simultaneously used not only to clarify the message, but also to increase the interest of guidance material. The application of this model is in line with the Rosjidan's (2004) recommendation in order to develop the guidance package by considering three key words, i.e.: motivation, information and training.

CONCLUSION

Finally, although we recognize there are some weaknesses in this moral guidance package, the pilot-tested or revised, particularly with the regard to the substance of moral values, it does not signify that the package cannot be used. The underlying reason is quite easy to understand that is since this nation is --- including junior high school students --- also face the problems such as the low of moral dimension of responsibility, honesty, discipline, diligence, frugal, polite and thoughtfulnes

LEARNING ASSESSMENT IMPLEMENTATION IN KINDERGARTEN, A DESCRIPTIVE STUDY IN WEST JAKARTA

Rohita; Nurfadilah

Al Azhar University of Indonesia

Email: rohita@uai.ac.id, nurfadilah@uai.ac.id

ABSTRACT

This qualitative descriptive research aims to describe the implementation of learning assessment in Kindergarten and to find out its effect to the next learning level. The data collection techniques were conducted through interview, observation, and documentation. The research subjects are threeearly childhood education institutions (Kindergarten) in KapukCengkareng West Jakarta. The results of the research show that the semester assessment: 1. does not correspond the natural and meaningful principles because the implementation of semester learning assessment was conducted in a week was started from Monday to Friday in a shorter time compared to the school time;2. does not correspond the holistic assessment principles because the materials in the assignment for the students do not cover the aspect of physical motor and emotional social development;3. does not correspond the individual assessment principle because the students from both Group A and Group B were given the same assignment.4. does not correspond to the authentic principles because the teacher also helped the students to finish the given assignment; 5. Multi-contextual and multisource principles, because the teacher only used one source and an assessment tool, that is the assignment sheet and the assignment itself. Related to the result, the outcome was not used to determine the next learning activity. The conclusion of the research is: 1. The semester assessment that was conducted in the three kindergartens has not presented the conformity to the learning assessment principles in Kindergarten: natural and meaningful, authentic, holistic, individual, multisource and multi-contextual principles; and 2. The implementation of learning assessment particularly semester assessment does not directly affect to the decision of the subsequent learning.

Keywords: learning assessment, kindergarten children

The early childhood education is the education that aims to the children with the age range of 0-6 years old (Republic of Indonesia Law of National Education System article 1 paragraph 14). In its implementation, the range of age is divided into several groups. One of them is the range of 4-6 years old commonly known as age of Kindergarten (Taman Kanak-Kanak/TK).

The stimulation given at school is the teacher responsibility. Several variations should be given in order to develop the potential that is owned by the children.

Stimulation that is given should cover all child development aspects: language, cognitive, religious moral, emotional social, art, and motoric physical.

Giving the stimulation should follow the characteristics, the abilities, and the learning principles of the children. The focus is the learning process, compared to what the children have learned (Feeney et.al, 2010; Henrick& Weiss-man, 2010).

Kindergarten focusing to the child defends three principles: every child follow a unique development pattern. The children learn through the direct experience with different people and materials. Playing is important for the total child development.

Experimenting, exploration, finding, trying, restructuring, speaking, and listening are activities that should be provided in Kindergarten programs. Those activities fit to the child development of 4-5 years old.

Playing becomes one of the child characteristics. The learning that is packed in the attempt of stimulation giving should be able to evaluate.

Some activities done by the child should be able to assess in order to know the level of accomplishment of the learning. The assessment should be done when the children do the activities arranged by the teachers.

The assessment is executed in all child development aspects. Accordingly, the teachers are able to know clearly the child ability. The assessment result should be used for the teachers, the parents, and the children themselves. In the practice, there are some schools or educational centers for early childhood education (Kindergarten) that giving the assessment by making the special schedule for "examination".

Each child was given several sheets of paper containing simple items to solve. The material in the "exam" paper only functioned to assess the cognitive ability of the child. Meanwhile the other aspects particularly the aspects of religiosity, emotional social, and motoric could not be measured.

Leonard (in Brewer 2007:207) writes that:

"..observation helps teachers get to know children as individuals with unique personalities, provides a basis for making educational decisions, and generates the data needed to help parents see and understand their children's progress."

In other words, by doing the observation as the assessment tool, the teacher is able to see many things from the child related to his/her development or abilities.

Seeing that phenomenon, it is necessary to observe the assessment further by investigating the implementation of assessment in Kindergarten.

The statements of problem in this research are 1) how the process of learning assessment implementation in Kindergarten based on the holistic, authentic, continuous, natural and meaningful, individual, multisource and multi-contextual principles?; 2) how the impact of learning assessment implementation in deciding the subsequent learning?

Based on the background of the problem, the aims of this research are 1) to describe the implementation of learning assessment in Kindergarten based on the holistic, authentic, continuous, natural and meaningful, individual, multisource and multi-contextual principles; 2) to describe the impact of assessment in deciding the subsequent learning.

Learning Assessment

The child of 4-6 years old according to National Association for the Education of Young Children (NAEYC) belongs to preschool group (3-5 years old). Meanwhile, Indonesian Law states that the child of 4-5 years old is included to the group of formal education that is Kindergarten.

In this group, the children characteristics are different from the other group characteristics.The following is the characteristics of preschool children based on the experts (Anita Yus, 2011: 18).

Based on Ministerial Regulation of Education and Culture No 147 Year 2014,

the child of 4-6 years old has the level of development that he/she should accomplish.The level of development accomplishment includes the whole aspect of child development, that is, the development of religious morality, emotional social, language, motor physic, cognitive and art.

The six aspects of the child development should be able to be measured to know the level of accomplishment that is achieved by the child based on the existing indicators.

According to Ralph Tyler (in Anita Yus, 2011:39), assessment is a process of collecting the data to determine how far, in what part the aim of the education have been achieved. While Brewer (in Anita Yus, 2011:39) writes that the assessment is the use of evaluation system that comprehensive to determine the quality of a program or the progress of a child.

Different with the above opinions, Suyanto (2005:49) writes that in Kindergarten, the term assessment is used. Furthermore, Suyanto (2005) states that assessment is different with evaluation. Assessment is a process of observation, note-taking, and documentation of ability and the work of the child as the base of educational decision making that are beneficial for the child.

Based on the above statement, it is known that to know several child abilities and to get the beneficial decision for the child, it is necessary to do the assessment including the observation, note-taking, and documentation.

In doing the assessment, the teacher should understand two things: subject and target of assessment (Anita Yus 2011: 47-48). Related to the assessment subject, the teacher should really know who will be assessed. The Kindergarten teacher will assess the children in the range of age 4-6 years old.

Consequently, the teacher should really know who the Kindergarten students are, how their characteristics are, what should be assessed from the Kindergarten child, how to assess, what instrument that will be used, what is the assessment for, and the other important matters.

Besides knowing the research subjects, the teacher should also know the assessment target. Suharsimi in Anita Yus (2011: 48) state that the target or object of assessment is all entities that become the focus of observation because the assessor needs the

information about the target of assessment. Furthermore, Suharsimi (in Anita Yus, 2011:48) writes that the target of assessment includes the input, transformation, and output. The input includes the potential of a child that needs to develop. It consists of six developmental aspects: physical, cognitive, emotional social, art, and religious morality.

The aspect of transformation includes the material, methods, media, administration system and teachers. Whereas the output aspect covers how far a child accomplishes the targeted goal and has the basis for his/her later self-growth and development

The assessment should be done continuously. According to Suyanto (2005: 49-50) the assessment that is done continuously goes along with the learning activities. The assessment is done naturally when the children are playing, drawing or doing their work Anita Yus (2011: 64) confirms that related to the place and the time, the assessment that will be done should fit to the need of assessment and the child that will be assessed, and also the plan of the program used. For the toddler, the place and time is done based on the time of program implementation.

To perform the assessment or evaluation in right way, the teacher should understand well the assessment principles for Kindergarten child: 1. Holistic, 2. Authentic, 3. Continuous, 4. Natural and meaningful, 5. Individual and 6. Multisource and multi-contextual(Suyanti, 2005: 50-51). Doing the assessment needs the use of assessment instrument.In the educational institution for early childhood, including Kindergarten, the assessment instruments used are commonly the non-test assessment instrument: assignment, observation, conversation, anecdote notes, and portfolio. In their book, Wolfgang & Wolfgang (1992:213) write that "the primary assessment tool of the play-activity (child-centered) curriculum is the direct observation of children." Based on what Wolfgang & Wolfgang state, it is clear that direct observation is the assessment instrument that will be used for Kindergarten children focused on playing activities.

Furthermore, Deb Curtis and Margie Carter (2008:214) write the guidance of values or perspective that is expected and the note-taking that is able to do in the table 1.

According to the table, the educator is able to conduct the assessment in the forms of checklist, observation or collecting the children works in the form of portfolio that

its use is based in the perspective or value that need to develop.

The result of the assessment was given to the parents in the form of narration describing the ability that has been achieved by the child covering the growth and development aspects. The result should be able to answer the questions about how far the learning achievement of a student. Howard Gardner (in Anita Yus, 2011:39) confirms that the assessment is an attempt to get the information about the skills and individual potential through two targets, first, giving the feedback that is beneficial for the individual. Second, they are as data that are beneficial for the surrounding society.

The child of 4-6 years old according to National Association for the Education of Young Children (NAEYC) included in the preschool group (3-5 years old). In Republic of Indonesia Law,it is included into formal education group Kindergarten. In this age group, their characteristics are different from the other age group characteristics. The following is the characteristics of preschool children according to the expert (Anita Yus, 2011: 18)

Based on the Peraturan Menteri Pendidikan dan Kebudayaan No 147 Tahun 2014, it is known that the child of 4-6 years old has the level of development that they should achieve. The level of development should cover all aspects of child development.

METHOD

This research is done by applying the qualitative research method. The qualitative method is the research revealing particular social situation by describing the reality, formed by the words based on the collecting technique and the relevant data analysis gained from the natural situation. (Ghony&Almansyur, 2012: 26). The research subjects are three Kindergartens in Cengkareng, West Jakarta chosen based on the recommendation from the head of BaitulUyun Kindergarten, that is, Kindergarten Cahaya Prima and Kindergarten MutiaraIlmu. Those Kindergartens were selected because they have the same characteristics and problems with Kindergarten BaitulUyun in implementing the learning assessment. The data collection was conducted by applying observation, interview, documentation, and triangulation (Ghony&Almansyur, 2012: 26).

The data analysis was conducted in two stages, that is, during the data collecting process and in the end of data collection, that was done by working and organizing the data, selecting them become a unit that could be managed, synthesizing them, searching and finding the pattern, finding what were important and deciding what could be told to the others (Ghony & Almanshur, 2012: 247).

FINDING AND DISCUSSION
Kindergarten Baitul Uyun

Due to the demand from the society that the children should be able to read, write, and counting when they finish the Kindergarten and prepare them to be ready to go to Primary School, the teachers focus their teaching to those activities. Every day, the children are stimulated by the supporting activities in order to be able to read, write, and count. The other development aspects still get the attention but not in the balance portion.

The semester assessment was conducted in Amy, started from Monday to Friday, 09-13 May 2016. The activities of semester assessment were started by giving the assignment sheet. The children should write their names in the sheets. After that, the teacher explained how to solve the assignment by giving the examples in the board. The assignment given to children in Group A and Group B were the same, but for the PAUD (early childhood education) Group was different.

The first assignment for Group B is duplicating the alphabet in the section. The second task for Group B was filling in the blank by reading together and writing the answers individually. The task of the teacher in the semester learning assessment besidesexplaining the assignment, the teacher also helped the children who were not able to do the task. For the children that could not write the words completely, the teacher helped to fix the words having incomplete alphabets. The teacher also motivated the children and gave the reward by saying "you're smart" for the ones that were successful in completing the task. For Group B, three sheets of tasks were given for the language development.

Generally, the semester activities conducted on Monday ran well, however there was an incident that triggered the teacher emotion. During the process, the teacher told the children not to cheat and to do the tasks individually. If there had been a mistake, the teacher would also have helped the children to fix it. The teacher also reminded the students to write the words by spelling the letters first. For Group B, the tasks in the sheet that should be completed covering several themes that had been discussed before including the transportation theme. However, when the children were asked to mention and differentiate between the print and electronic media, they were still in difficulties. It made the teacher worked hard to explain that material in order to make the children able to complete the assignment of semester assessment. After the activity of semester assessment was complete, the teacher explained the test for the following day.

Kindergarten Mutiara Ilmu

Related to the semester assessment activity, there were questions from the society about the time of "the test". Most of the parents in Kindergarten MutiaraIlmu "know" that Kindergartens surrounding their place do the test every semester. They also asked Kindergarten MutiaraIlmu to arrange the test. This made the school to run the assessment every semester.

Basically, the semester assessment is the repetition of the material given before with the themes that had been discussed before. Those materials were collected, created like a test items, written in sheets of paper and given to the children to complete in certain period of time. The semester assessment in Kindergarten MutiaraIlmu was conducted from Monday May 16, 2016 to Friday May 20, 2016. The headmaster did not arrange the specific activity schedule for the semester assessment. The assignments on Monday were counting and language, on Tuesday were counting and language, on Wednesday were coloring and English language, on Thursday were language and counting, and on Friday were English language and art (coloring)

On Wednesday, the assignments to complete were coloring and relating in English language. For the English, the tasks given were the same for Group A and Group B. However, for coloring Group A was given simpler picture, that was a picture of butterfly compared to Group B that was given a picture of Javanese people.

For English language, the children did it together in a square place, as a result it could not be seen which child that was able to do the task and which are that was not. In

completing the task, the teacher still help the children by giving instruction what to do, what the meaning of an English word was without looking at the assignment and how the children solved the problems. When the children finished completing the task, the teacher asked them to write their names, but the section for it was not provided. Consequently, many children often forgot to write their names. The sheets also did not provide the space for the score.

The assessment conducted on Friday May 20 2016 was language aspect for both groups. The children complete the tasks by the help from the teacher that asked them by "point and read the sentence, find the answers". The children were asked to read the sentence carefully, if they could not do it, the teacher would read it. When the children asked correctly, the teacher asked them to find the sentence that fit to the answer. In completing the task, the children are also taught not to cheat. When there was a child made a mistake, the teacher would ask him/her to fix it. The result of the semester did not always become the basis of the subsequent learning.

Kindergarten Cahaya Prima

The reason to conduct the semester assessment is to know the study result of a child in one semester. The semester assessment will be used to fill the report as the additional score for the daily activities. The semester assessment did not include in the whole report. The report was filled in the form of narration for 1 semester and it is not used the number scoring but the category of * (star) that had achieved by the children.

Based on the interview that was done on May 6, 2016, it was known that the semester assessment in Kindergarten Cahaya Prima would be done for a week, started from Monday May 16, 2016 to Friday, May 20, 2016. However, in the reality, the school changed the schedule of the semester assessment from Monday May 9, 2016 to Friday, May 13, 2016.

Kindergarten Cahaya Prima did not make the written schedule for the semester assessment. The assignment for the assessment was given based on the aspect of child development. The first day was for the language development, the second day wasfor the cognitive development, the third and the fourth day were unknown, and on Friday May 13 2016 was for art development.

There are several important points 1) the implementation of semester assessment in the three Kindergartens was conducted in a week from Monday to Friday during the school time. However, the duration was shorter than the usual time for studying. The difference in the length of time does not match with the natural and meaningful assessment principles where the assessment should be done continuously parallel with the activities; 2) the materials in the assignment given to the children did not cover the whole aspects of development, that is physical motor and cognitive aspects. This does not resemble to the holistic assessment principle in which the assessment evaluate the whole aspect of child development; 3) materials in the assignment sheet given to the chilldren from both groups in Kindergarten BaitulUyun were the same.Whereas in Kindergarten MutiaraIlmu, the same assignment, English language, was given for both groups. However, the other assignments were different. In Kindergarten CahayaKapuk, the assignments were given differently for both groups. In its implementation, the assignments were done together at the same time, as a result, it was not clear which child that was able to complete the task. This does not correspond to the individual assessment principle in which the child is assessed based on their individual level; 4) in completing the task given in the process of semester assessment, the teacher helped the children. This does not correspond to the authentic principle in which the result should be originally from the child work; 5) the data collection and assessment instruments were the given task. Actually, the assessment could be given in other ways such as observation, conversation, anecdotal notes, and portfolio. This implementation does not correspond to the multisource and multi-contextual principle in which the assessment could use several assessment methods; 6) the result from the semester assessment is not always used for the basis of the subsequent learning, in Kindergarten BaitulUyun, Cahaya Prima, and MutiaraIlmu. The result of the semester assessment is more used to fill the report as the additional grade for the daily activities. It can be stated that the information from the semester assessment still cannot be used to plan the subsequent learning.

CONCLUSION

Based on the research result, it can be concluded that 1) the implementation of learning assessment. The semester assessment conducted in the three Kindergartens has not presented the conformitywith the principles of learning assessment in Kindergarten: natural and meaningful, authentic, holistic, individual, and multisource andmulti-contextual principles. It can be concluded that "if the Kindergarten teacher understands well the learning assessment, the assessment activities will be more comprehensive and if the teacher do not understand well, the assessment activities will be not comprehensive."; 2) the impact of learning assessment implementation will determine the subsequent learning. The implementation of learning assessment does not directly affect to the decision of subsequent learning. The conclusion is "if the assessment is conducted based on the assessment principles, it will give the positive impacts to the following activities and if not, it will give the negative impacts.

The suggestions are 1) it is better if the school does not give the semester assessment to the students. The assessment can be given through the daily assessment from the children daily activities. The parents should not be worried and the students should not be scared of the assessment. The teacher should give the explanation to the parents about the importance of learning assessment for the Kindergarten children that confirms the learning assessment principles. 2) The teacher should understand well who and how the Kindergarten children are thus they can stimulate and assess them based on their level of ability. This can be done through discussion with psychologists and education experts or joining the trainings about child

growth and development. 3) A teacher should enhance his/her understanding about the learning assessment in order to conduct the assessment correctly and gives the benefit to the children, teachers, parents, and surrounding societyThis can be done by doing the comparative study to other early childhood educational institution, particularly PAUD and Kindergarten; reading literature about learning assessment in Kindergarten; and discussing with the experts.

COMIC STRIP PRINT MEDIA:
INSTRUCTIONAL MATERIAL IN TEACHING SCIENCE

Rowena E. Lontayao; Anabelie V. Valdez

Mindanao State University, Philippines

Email: anabelievillavaldez@gmail.com

ABSTRACT

Technology is a promising educational tool that elicits student's interest in learning. Visual representation such as videos, motion pictures and animations, are powerful tool that let students to easily recall the concepts of the lesson. However, majority of the schools in the Philippines has no access to this said educational technology tools. This study innovate a powerful instructional materials (IM's) as a substitute for the modern educational technology that we have today called ―Comic Strip Print Media (CSPM). The main purpose of this study was to evaluate the effectiveness of the CSPM in order to validate if this IM's can be used for classroom across different cultures. CSPM was designed by the researcher using the learning materials from different sources. The evaluation of CSPM took for two years of its revisions and the final stage of its implementation took effect in the school year 2015-2016. For three years of its used, results revealed that the CSPM enhanced students learning skills and motivated them to think critical, work collaboratively and develop manipulative skills in doing their activities independently. Although the instructor acts as facilitator only, still the student's shows a remarkable performance over the years of its try out. Journal logs of the students proved that they enjoyed their science learning with the use of CSPM.

Keywords: Comic Strip Print Media (CSPM), science teaching, students' performance

Technology is an effective tool in teaching and learning. In concepts, technology includes media, machines, networking hardware and other forms of theoretical perspective on the different applications of technology. In education, technology is not limited only on modern innovations which we considered nowadays a high technology. Numerous types and forms of technology are very useful in teaching and learning depending on the pedagogies and learning environment (Smaldino, S. E. et al, (2005). In this era of globalization, modern technology is in revolution which includes numerous types of media that could deliver information in a form of text, audio, images, animations, video etc. We also have the e-learning which can occur in or out in the classroom. However, teacher's accountability in using educational technology has largely resulted in the specification of educational outcomes of the teachers and the learners as well (Seel and Richey, 1994)

Despite of modern technologies that we have today, still; we cannot devoid the great influence of textbook as print media. Print media are still having a great influence in teaching-learning process especially on remote areas in which modern technology is not existing or not available. In the Philippines alone, probably there were more than 50% public schools that have no access to any modern technology that we have today specially the areas where no supply of electricity.

Let us take a specific example which is our school in Lanao del Sur. The school where I am teaching located at the heart of the town. The said school was a recipient of some computer units given by the national government. There was a computer satellite installation also in the school through the initiative of the PTCA. However, the available computers was not enough for students used but it is not a huge problem for us as teacher. The worst scenario was that, there were no financial allotment for the maintenance of the computer units and the internet connections, thus, the computers and the internet connection did not last even for one year. At this moment in time there are no available computers for students use. Thus, the teachers were not able to used modern technology in the teaching process and many of the teachers are not also knowledgeable in modern technology applications as an educational technology tool.

In light of these ongoing problems, teachers should be artistic, creative, innovative, and diligent in designing different instructional materials that could enhance students learning and achievement. In the absence of modern technologies, I designed a comic strip print media using different learning approach and teaching strategies in package as the instructional materials used in science teaching tailored to meet the individual learning differences. The advent of global classrooms, competent teachers should acknowledge individual differences among learners, and responding to these differences has become more challenging (Owen, 2008).

The purpose of this study was to designed instructional materials as substitute for modern educational technologies like, animations, films, videos and other visual materials in motion and evaluates its effectiveness in enhancing students' achievement in science and its motivation to learn science concepts.

METHOD

This study was longitudinal in nature designed to evaluate the influence of the comic strip print media as instructional material to student's science achievement and motivation in learning science. The study utilized mix-methods of quantitative and qualitative triangulation design. Triangulation design involved doing quantitative and qualitative study concurrently. Quantitative analysis includes descriptive statistics, t-test and correlation measures. Qualitative analysis includes journal logs, observations and interviews.

A total of ninety one students in grade eight at MSU-Balindong Community High School were purposively selected and involved in this three phase longitudinal study. Phase 1 was the try out or pilot testing of the instructional materials which involved twenty eight (28) grade 8 students only. For the second and third year of its implementation, it involved thirty four (34), and twenty nine (29) grade eight students respectively. All respondents of the study belonged to the pilot (fast-learner) section which was homogeneously group according to their average grades in English, Science and Mathematics.

Two research instruments were used in the study. First was the researcher- completed instrument and the second instrument was the participants-completed Instruments. Researcher – completed instrument refers to the comic strip print media, while participants completed instruments referred to their journal logs and grade in science. CSPM employed different teaching strategies and interactive activities (See Appendix of this paper for the CSPM sample Module). Data were gathered in accordance with the phases of its implementation. Phase 1 the try out phase, phase 2 the modification phase, and phase 3 the final phase. Phase 1 was the first implementation of the comic strip print media which covered the whole science topic for school year (AY 2013-2015). Phase 2 was the implementation of the revised/modified comic strip based on the output of phase 1 which also took one year (AY 2014 – 2015). Phase 3 the final phase involved all grade eight students

from fast to slow learner. At this phase, the comic strip print media was already more reliable and validated considering it was already used for two years of its modifications.

RESULTS AND DISCUSSION

Collins (1992) said that "Technology provides us with powerful tools to try out different designs, so that instead of theories of education, we may begin to develop a science of education. However, developing countries like Philippines is having a poor accessibility on educational technological tools. As such teacher's innovative skills become a challenging role bringing traditional technology into a modern approach. Based on the data gathered using CSPM during phase 1 (AY 2013-2014) of its implementation science achievement many (39%) of the students got a failing average grade in Science since they obtained a grade of 74 and below. In order to offset their failing grade almost half of the class were required to take the summer class. It was also noted that the highest average grade of the students was fall on 81-85 only which was 18% of them got that grade range. These results may be due to some other factors beyond the scope of this longitudinal study like, vocabulary knowledge of the students, mathematical skills, and analytical skills which are very important factors for effective learning. Figure 1 below is the pie chart of the students' academic achievement in Science Phase 1.

Figure 1: Students Average Grade in Science 2013-2014
After of its first year of using of the CSPM as instructional materials in teaching Science, feedbacks from the students, co-teachers, and even the author of the instructional materials was gathered and served as basis in the revision of the of the CSPM and was used again in the next school year 2014-2015 (Phase 2). Figure 2 below shows the student's science achievement at the end of the school year.

Figure 2: Students Average Grade in Science 2014-2015

N= 34
As shown in the Figure 2 above, no more students obtained a failing grade. Noting that in the first year used of CSPM there were failure students in science, and only 81-85 was the highest range of grade average. However, as depicted in Figure 2 CSPM second year of its used, many (32%) students obtained a grade range of 81-85, and 24% students even reach a grade range of 86-90, and 3% obtained an average grade of 91 above. The great percentage increase of student's achievement in Science might was attributed to the revision and modifications of the CSPM instructional material. Likewise, the classroom setting and interaction, strategies and activities in the CSPM was also modified in the 2nd year of its used.

Since CSPM was tested to facilitate student's interest in learning science and improve student's achievement in science then, the CSPM instructional material was used as the main instructional materials in science teaching and learning interaction among grade 8 students at MSU-Balindong Community High School (Phase 3).

For the third year of its used it was noted that more than 50% of the students obtained or got an average grade in Science under the grade range of 86-90, and with a corresponding decrease of the number of students who was still in the grade range of 75-80. This results is a good manifestation that the CSPM really motivate the students to learn and develop their thinking skills. Figure 3 below is the average grade of students in Science during the 3rd year used of CSPM.

Tracing the trends of the students achievement in Science, Figure 4 below shows that the students continuously improving their science achievement with the use and influence of CSPM. As shown in Figure 4, CSPM became more effective on its third (3rd) year used considering that students got good grades in Science higher than the overall grade average.

Figure 4: Trends of Students Grade in Science in terms of Mean
Based on student's journal logs, they said that the comic strip print media was very interactive and the activities were very engaging yet challenging. They said that even without the use of modern educational technology, still they enjoyed their learning because of CSPM instructional materials. Tenedero (1998) mentioned that peripheral learning materials like posters, charts, graphs and sayings allow students to peripherally intensify and enforce their learning and memory retention. Students can attain optimal learning and memory retention if they were given a meaningful and positive classroom, social acceptance, enthusiasm, and stimulating challenges instructional materials.

John Dewey, a well-known philosopher of education reiterates that science education must not taught in a way to develop young scientific thinkers but rather should be taught as a process and way of thinking – not as a subject with facts to be memorized. Through CSPM instructional materials, the students potentials and skills were developed and enhanced, and slowly became independent learners.

Moreover, instructors and instructions became effective if it will acknowledge the differences among learners. With the advent of global classroom, teachers must include divergent life experiences, and immersed various life roles that are relevant to the personal experience and real-life setting of the learners Instructional materials that are suited to the different levels of learner's involvement will promote a successful teaching-learning process and enhance the thinking ability of the learners (Reiser and Dempsey, 2006).

Banchi and Bell (2008) explain that teachers should begin their inquiry instruction at the lower levels and work their way to open inquiry in order to effectively develop students' inquiry skills. Open inquiry activities are only successful if students are motivated by intrinsic interests and if they are equipped with the skills to conduct their own research study.

CONCLUSIONS

Technology is an application of science however; teachers must carefully plan with the use

707

of technology that the ethical practices must be carefully considered. Using technology in the classroom must be a tool in facilitating learning and improving performance of the students. On the other hand, not all schools in the country has access on modern educational technology, thus, teachers must be innovative enough in bringing technology into other dimensions through comic strip modules as instructional materials. Thus, CSPM is a promising instructional tool that promote holistic learning among students since the content and approach of the CSPM instructional materials engage human person—body, mind, and spirit—to learn that caters the individual differences of the learners learning styles. In line to this, the researcher designed instructional methods that could address the different learning styles, emotional intelligence, and critical thinking of the learners.

Based on the findings and conclusion, Figure 5 below is the proposed model for designing instructional materials (IM's). This model is named as **Valdez Pentagon Model.** This Valdez Pentagon Model will be used in designing any instructional materials that could enhance student's creativity, as well as students learning, and thinking skills. In this model, there are five important components that could interact with each other and serve as a foundation in designing an effective IM's. The five components are the teacher's pedagogical content knowledge (PCK), students learning style and learning types, educational and learning theories, the school/classroom environment, and the student's emotional intelligence. These five components are very important in planning and designing a successful and workable

IMs'. The teacher PCK provides inputs and capability in designing and using the IMs'. The theories provide interesting insights in linking the students learning styles and learning types and the appropriate pedagogies. Emotional intelligence is also important in the designing of IMs' in relation to teachers PCK, theories, learning styles and learning types as well as to the school/classroom environment. These five key components could influence the designing of IM's and may influence the teaching and learning process in the classroom.

Designing IM's is a challenging task that needs training. The teacher training is to ensure the maximum amount of resources that are used and that the teachers are producing the best learning scenarios. There is a necessity for professional collaboration when executing new teaching methods of program (Chu, 2009; Twigg,

2010). Twigg's (2010) said that education professionals who participated in her experiment emphasized year round professional development sessions, such as workshops, weekly meetings and observations, to ensure inquiry is being implemented in the class correctly. In addition, Chu's (2009) emphasized that professional collaboration of educators, information technicians and librarians is necessary to provide more resources and expertise for preparing the structure and resources for the teaching-learning process. ✍

PROBLEM STRESS IN DEVELOPMENT SCHOOL STUDENTS PSYCHOLOGY OF EDUCATION AND COUNSELING STUDENTS

Rr. Dina Kusumawardhani

Universitas Sultan Ageng Tirtayasa, Serang, Indonesia
e-mail: dinakusuma_wardhani@yahoo.com

ABSTRACT

Conflicts can be defined as a situation where one is confronted with motives, beliefs, values and goals are mutually contradictory. Conflicts can be experienced by anyone and anywhere, including the school community. Students, teachers, or principals in certain times so may be faced with a conflict. Causes of conflict : individual differences, differences in cultural background , difference in interest between, individuals and groups , changes in the values of rapid and sudden. Stress is a condition of stress (tension) both instinctively and psychologically caused by the demands of the environment as a threat. Stress is a part of the human condition. Factors - factors that cause stress: uncertainty, cognitive dissonance. Strategies that can be done to cope with stress: Increases tolerance to stress, Identify and change the source of stress

Keywords: *conflict, stress, causes of conflict, environment, strategies in stress*

Learners are main and most important resource in the educational process formal. there are not learners, no students can learn without teacher and teacher can not teach without participants with students. .Defenision above learners are students who strive each students developing the potential in formal education and non-formal at the level and type. It the essential points of the nature of learners:

1. Learners are people which has the basic potential differential cognitive or intellectual, affective and psychomotor
2. Learners are humans who have differentiation priodesasi development and growth, despite a relatively similar pattern
3. Learners have the imagination, perception, and his own world, not just miniature adults Psychology is a discipline that is very beneficial to human life. Psychology can be divided into two branches, a branch of theoretical and applied psychology. Psychology can theoretically be divided into two parts, the general psychology and psychological quirks. General psychology is psychology theoretical study human mental activities of a general nature in order to seek common arguments and theories of psychology. While the special psychology is a theoretical psychology which investigates the special features of human mental activity.

Special Psychology consists of:
1. Developmental psychology, studying the development of behavior and human mental activity throughout the life span, from the time of conception until death.
2. Social psychology, studying human mental activity in relation to the social situation.
3. Personality psychology, study of the structure of human personality as a whole.
4. Abnormal Psychology, examines the mental activity of individuals classified as abnormal.
5. Differential psychology, elaborates on these differences between individuals.

Benefits of psychological development of learners, namely: (1) With the knowledge of the development of learners, a teacher will be able to provide realistic expectations of the teenagers. This is important, because if too much is expected of children of a certain age, the child may develop feelings of inadequacy if he does not reach the standard set of parents or teachers; (2) Knowledge of development can help us in providing timely response to the specific behavior of a child; (3) Knowledge of the development of learners can help teachers know when the normal development begins in earnest; (4) By knowing the normal pattern of development, enabling teachers to previously prepare children to face the changes that will occur in the body, attention and behavior; (5) Knowledge of development enables teachers to provide appropriate guidance to the child's learning; (6) Study of the development may help us understand ourselves with the psychological development of learners enables teachers to provide assistance and pendiidkan precisely the patterns and levels of child development.

DISCUSSION
The Problem of School Stress In the Development of Learners

Stress is a condition of stress (tension) both instinctive and psychologically which in result by the demands of the environment is perceived as a threat. Stress is a part of the human condition. Within certain limits, stress helps us stay motivated (eustress). But sometimes we get too much stress could reduce the quality of our performance (distress), therefore, we need to have the ability to manage stress.

To be able to manage stress, then the steps we need to do is: digging stress symptoms, understand the factors causing stress, and train yourself to do the mitigation mechanisms (coping mechanism).

1.Stress and illness

Stress increases the risk of various physical ailments, ranging from indigestion to heart disease, even keleahan think upset or stress on a person can disrupt other organs such as the liver and pancreas as well.

2. Stress and endocrine system

Stress has a domino effect in endocrine system, which is a system of the body such as the glands that produce and secretion release that called hormone (hormones) directly into the blood vessels (the other glands, such as salivary glands that produce saliva).

3. Stress and immune system

Stress makes us susceptible to disease. Eg In a study conducted by Stone et al. (1994), those who reported experiencing daily stress levels are higher, such as stress at work, showed lower antibody in their blood which to fight the flu virus. Research on stress, Hans Selye (1976) coined the term adaptation syndrome overall (general adaptation syndrome; GAS) to explain the general pattern of biological response to Excessive and prolonged stress. Model GAS states that body as such stressful circumstances alarum clock with a system that did not stop until the power runs out.

4. Stress and life changes

Changes of pleasant or unpleasant life can cause stress, positive life changes that result in nuisance rather than negative life changes. The school has a very important meaning for the life and development of learners. But at the same time, the school was also to be a source of problems. Which in turn triggers the occurrence of stress among students. At school the child is a member of a small community where there are tasks that must be completed, people need to be recognized and limiting behavior, their feelings and attitudes, life events experienced by the child as a member of a small community named school is not an uncommon cause feelings of stress in themselves.

Several studies in Indonesia also showed no stress phenomena associated with the event students live at the school.

B. Psychological Problem Student

Problems related to physical and motor development In adolescence characterized by rapid physical growth. The physical state in adolescence was viewed as an important thing, but when the physical state is not in accordance with expectations (discrepancy between body image and self picture) can cause dissatisfaction and lack of confidence.

Like wise, physical development is not proportional. Maturity reproductive organs in adolescence requires effort gratification and if it is not guided by the norms can lead to deviations of social behavior. Problems related to cognitive development and language in early adolescence marked by the rapid development of intellectual abilities. However, when the teenager did not get a chance development of intellectual abilities, especially through education at school, it may be intellectual potential will not be developed optimally. Like wise adolescence, especially early adolescence is the best time to get to know and study foreign languages. But because of the limited opportunities and infrastructure, causing the teenager trouble to master a foreign language. Can not deny, in the era of globalization, foreign language skills are essential for supporting life and Karis success person. But with the barriers in the development of the inability of foreign language will certainly some effect in the life and career success story. Delays in cognitive development and language can result anyway o n aspects of emotional, social, and behavioral aspects and other personalities. Problems associated with the development of social behavior, morality, and religion. Adolescence is also referred to as social future hunger (thirst social), which is characterized by the desire to hang out and received environment of peer group (peer group). Rejection of the peer group can lead to frustration and made him as isolated and feeling inferior. On the contrary, if a teenager can be accepted by their peers and even become an idol of course he would feel pride and honor within him. Problema behavior does not only occur with the peer group, but also can occur with parents and other adults, including the school teacher. This is due in adolescence, especially early adolescents will be marked by the desire ambivalent, on the one hand the desire to let go of dependency and can determine his own choice, but on the other hand he still needs a parent, especially

economically. In line with the growth of reproductive organs, social hubungann developed in adolescence is marked also by the desire to establish a special relationship with another type and if it is not guided actions can lead to deviant behavior of social and sexual behavior. In adolescence is also characterized by the desire to experiment and test the reliability of the existing norms, if not guided, will probably develop into a conflict of values both in themselves and with their environment.

Problems associated with the development of personality, and emotional Adolescence is also called the period to determine the identity (self identity). The identity of any search efforts, a lot is done by showing the behavior of trial and error, imitation behavior or identification. When teens not determine her identity, she will be having an identity crisis or identity cinfusion, so it may just be the formation of personality system that not describe the state of being real. Reactions and emotional expression is still unstable and not under control in adolescence can have an impact on personal and social life. He became frequently depressed and moping or he actually be people who behave aggressively. Quarrels and fights often occur as a result of emotional instability.

Factors Contributing to Stress

In general, the main factors causing stress include:

Threats. Perceptions of the threat makes people feel stress, both physical threats, social, financial, and other threats. Things will become worse if the person is a threat mempresepsikan feels that he can not perform any action that would reduce the threat.

Fears. Threats can cause fear. Fear makes people imagine will occur after an unpleasant and it makes people become stressed.

Uncertainty. When we were not sure about something, then we will be hard to make a prediction. As a result, feeling it would not be able to control the situation. Feeling unable to control the situation would inspire fear. Fear causes us stress.

Dissonance. If there is a gap between what we do with what we think, it is said that we experience cognitive dissonance, and it will be perceived as stressful. For example, if we feel that we are good people but in fact hurt other people then we will experience dissonance and feel stress. Cognitive dissonance may also happen if we can not keep the commitment. We believe that we are honest and precise promise, but there are times when situations / environments do not support us to the truth or

the right appointment. It will make us feel stressed because we are threatened as dishonest or unable to keep their promises.

Other factors that can cause stress is everyday life such as:
1. The death, either death of a spouse, family, and friends.
2. Health: accident, illness, pregnancy.
3. Crime: sexual assault, robbery, theft, pickpocketing.
4. Persecution yourself: drug abuse, alcoholism, self-mutilation.
5. Changes in the family: separation, divorce, birth, marriage.
6. Sexual problems.
7. Conflicts of opinion: the spouse, family, friends, coworkers, boss.
8. Physical changes: lack of sleep, work schedule.
9. The new place: on vacation, moving house.
10. Finance: lack of money, have money, and invest money.
11. Changes in the environment: at school, at home, at work, in the city, to go to jail.
12. Increased responsibility: their new dependents, new jobs.

In addition to factors that are common, there are six major groups of causes of stress factors, namely:
1. Demands the task
2. Control of employees, relating to how the employee do the job
3. Support obtained from co-workers and leaders
4. Relationships with colleagues
5. An understanding employee roles and responsibilities
6. How far the institution where the work negotiating with new employees. psychosomatic

CONCLUSIONS AND RECOMMEDATION
cONCLUTION

Stress is a condition of stress (tension) both naruliah and psychologically which in result by the demands of the environment is perceived as threat. Stress affecting all of us. Stress conditions can be observed from the symptoms, both emotional symptoms / cognitive and physical symptoms. If we can mark the symptoms, then we can manage it. School stress has an impact on the personal lives of children, whether physical, psychological, or psychosocial or perilaku. Negative or positive impact of the phenomenon of school stress, depending on the degree of stress that we need to tackle dialami.Stres, handled or managed by well, so that it becomes a positive stress, which

challenged students to improve the quality and ability of self, as well as the livelihoods of life can be maintained.

RECOMMENDATION

We as a person should be able to be wise educators in educating and making learning curriculum that did not make the learners have difficulty causing stress. Negative or positive impact of the phenomenon of stress from school, depending on the degree of stress experienced. High, moderate or low degree of stress experienced by adolescents due to various demands of school, largely depends on the assessment of their cognitive, mental processes continues to interpret the various situations in their interaction in the individual so that students can respond to the stress of school in a positive way, schools are required to design and implement intervention programs and training stress on students.

CORPUS BASED CROSS-CULTURAL DISCOURSE:
THE CONNOTATIVE MEANING IN INDONESIAN AND AMERICAN POLITICAL EUPHEMISM

Rusman Roni
Lembaga: ……..
Email: …….

ABSTRACT

This article is focused on pragmatics in relation to Indonesian and American English euphemism The aim of this study is to determine whether there are some political and non-political euphemisms based on corpus. Utilizing qualitative approach, and a diachronic and synchronic study, this study is conducted on political euphemism found in Jakarta Post, Newsweek and Sindo. The main findings include the categories of political and non-political euphemism indicates that political and non-political euphemisms which appear most frequently in the article are: denial, metaphor, acronym. Thus, the results suggest that denial was commonly used in politics. The results lead us to believe that the form cannot reflect its meanings.

Keywords: *political euphemism, corpus, associative meaning*

Conceptually,corpus-based studies utilize corpus data in order to explore a theory or hypothesis, Tognini-Bonelli (2001). The corpus aims to validate it, refute it or refine it. Corpus linguistics as a method underpins this approach. Nowadays pragmatic discourse study has focused our attention of communicative competence. More specifically, this article is focused on pragmatics in relation to Indonesian and American English euphemism. One of the basic principles of political euphemism is that the disprefered expressions should be replaced by the preferred expressions to execute user's communicative intention on a given context and to avoid possible loss of face. Hymes (1974) argues that language must be studied within the framework of its social context and function. He further refers to those factors of contexts as SPEAKING (settings, participanrts, ends, act sequence, keys, instrumentations, norms, and genres). To serve the purpose, Canale (1983) stated that one has to possess grammatical competence, sociolinguistic competence, discourse competence, and strategic competence. In the same sense, an individual has to possess communicative competence to execute the communicative intention effectively. The communicative competence includes lexicon and grammar.

This study was inspired by Roni (2000) which was conducted on a study of euphemism with a synchronic study. He continued his study based on the perspective of cultural translation to the students of FKIP UTP by using a synchronic study.Then,

Hojati. Alireza. (2012) studied Euphemism in the Context of English Speaking Media. The results indicated poverty and millitary related euphemism figured prominently in the Media. Unlike those studies, this study focused on synchronic and diachronic study. The aim of this study is to determine whether there is difference and similarity between Indonesian and American political euphemism in the respective languages. Utilizing qualitative approach, the study is conducted on political euphemism used in corpus: the associative meanings in Indonesian and American vocabulary. In order to describe the differences and similarities in cross-cultural pragmatic pcrspective, a discourse analysis is adopted, employing the grounded theory. The key instrument for this study is the investigator himself. The analysis of the data is conducted continuously through the process of displaying the data, reducing them and drawing conclusion.

The data of this research comprises of the texts written by the Indonesian and American in the editorial page, opinion and comments. This study deals with three perspectives; ideational, pragmatics and micro and macrostructure of the text. In an attempt to gain insight into the similarity and the difference between the Indonesian and American euphemism. This study investigated the political euphemism based on corpus written by the Indonesian and American editors. The major research question is put forward to direct the investigation: "How do euphemisms found in

Indonesian corpus differ from those found in American English corpus in terms of form and content?" Subsidiary questions are: a) the categories, b) the function, c) the interpretation,(micro-macro structure. ideational and interpersonal) local and analogy, mental model, knowledge of the world and context, topic framework. d) usage, e) style, f) degree of politeness, g) choice of perpective. h)Illocutionary.This study was descriptives: that it aimed at describing the appearance of political euphemism in Indonesian and Amencan English vocabulary. The technique for data gathering included the analyses , materials, through intemet on-line. The data obtained were cyclically analyzed, organized and interpreted cross-cultural pragmatics and cross media, namely Indonesian and American English Vocabulary. Credibility of the data were examined by applying some of these techniques: (1) triangulation, (2) peer debriefing, (3) negative case analysis. (-I) referential adequacy, (5) transferability. While the scrutiny of dependability and contirmability, accomplished through auditing by the author's advisors.

Method of Corpus Based Cross Cultural Discourse

The cross-cultural corpus can be judged from linguistic corpus, as long as the corpus could give sufficient information.

For example (saying; dipecat). Ask the students to demonstrate their ability to write the following words in a piece of writing: euphemisms.

-Indonesia : dirumahkan
American English : given the axe

Example2. Hal 6. 25 oktober, 2016 koran Sindo.kolom 1.
Pemberantasan Pungli junjung wibawa hukum Pemerintahan Joko widodo dan JK masih memiliki kekurangan diantaranya pelayanan publik yang masih perhatian masyarakat.

Gloss: The word pungli is considered as a euphemism because it is unclear. And it is the category of acronym euphemism. whereas American used the words bribery or drink.

Corpus driven from Jakarta Post. October 29, 2016. The theme for this year's WMHD is "Dignity in Mental Health — Psychological and Mental Health First Aid for All". There are two underlying aspects to be understood: dignity in mental health and psychological first aid. Indonesia has been tackling and will continue to face these two challenges.

Speaking of dignity, we should address the stigma associated with mental illness so that dignity is upheld and respected.

Gloss: The word mental health is considered as a euphemism because it is unclear. And it is the category of one to one substitute euphemism. whereas used the Indonesian words sakit jiwa or miring.

-Indonesia : bantuan luar negeri(fogged up), American English : financial support (tansparent)
-Indonesia : dimejahijaukan
American English : put on trial
-Indonesia : lansia
American English : senior citizen
-Indonesia : penyesuaian tarif
American English : increase
-Indonesia : di gebuk (dibunuh)
American English : pacification centre

-Indonesia : dilengser
American English : made rundant
 : made redundant

-Indonesia : negara miskin
American English : emerging country

-Indonesia : surat lamaran ditolak
American English : let us call you later and don't call us
-Indonesia : wafat
American English : flight to glory

-Indonesia : dijual : privatisasi
American English : be sold out
-Indonesia : diamankan such some district leader : Romi Herton, Fahri, Yan Anton etc
American English : to be arrested

The symbol and metaphor used is different from one country to another country. and from one situation to another situation.

According to Blum-Kulka (1984), the most authentic data collection of speech acts is done via ethnographic means. It seems to us that social context should be included in the testing of cross-cultural pragmatics, eventhough the instrument used is not fully backed up by the real –life context.

Example1 of an open-ended questionnaire responded by some respondents or written discourse completion test.

Instructions: Please read the following descriptions od situations in which you might find yourself. Think of what YOU might say in response to this situation. Write your response in the space provided. Say as

much or as little as you wish- you may choose to say nothing in severalcircumstances.
Situation:
It is your birthday,and you are having a few people over for dinner. A friend brings you a present. You unwrap it and find a blue sweater.

Example2 of an open-ended questionnaire responded by some respondents.
Version A:
In a cafeteria, you accidently bump into an older person. The coffee spills all over the person, scalding his/her arm and soaking his/her clothing.
The person :Ooooh! Ouch!
Version B:
In a cafeteria, you accidently bump into a friend who is holding a coffee. The coffee spills all over your friend, scalding his/her arm and soaking his/her clothing.
The person :Ooooh! Ouch!

This type of questionnaire enables researchers to reach large numbers of respondents and statistically control for variables and analyze the data accordingly.

Apology elicitation
At the university
Ann misssed a class a day before and would like to borrow Judith's notes.
Ann...

In a staff manager's office
Tina has got an appointment, for a job interview, with the staff manager of Maju Mundur Co. The interview was tostart at 10 o'clock, but the staff manager only tur at 10. 30, as he was called to unexpected meeting.

Staff manager: Good Morning, Miss Hawkins..............................
Tina Hawkins ; That's al right. I have got plenty of time anyway.
From the answers given to (10 we can learn what preferences native speakers of a particular language have for realizing a request for action among familiar equals, a crosslinguistic comparison will help us identify the similarities and differences in strategy preferences under the same sociopragmatic constraints across languages.

Judgement Test.

A fellow student in your class misssed a yesterday's session and would like to borrow your notes.
a. Can I borrow your notes from yerderday.please?
b. Could borrow your notes from yerderday. Please?

c. Would you mind If I borrow your notes from yerderday?
d. I misssed yesterday's notes can I borrow your notes?
e. I misssed yesterday's notes could I borrow your notes ?

In a staff manager's office
You have got an appointment, for a job interview, with the staff manager of Maju Mundur Co. The interview was tostart at 10 o'clock, butr th staff manager only tur at 10. 30, as he was called to unexpected meeting.

Staff manager turn to you and say:
Sorry to have kept you waiting
Sorry Iam late, I hope I haven't kept you too long.
I was unavoidable detained at a meeting.
I am sorry I was held up.

FINDING AND DISCUSSION
The main findings include first of all, political and nonpolitical euphemisms are context specific culture. Indonesian political euphemism commonly use passive form rather than active form. whereas, Americn used active form.

The categories of political euphemism indicate that euphemisms which appeared most frequently in the news media are: hyperbole, denial, metaphor, acronym, borrowed term and informal style, litotes. Other categories, such as euphemistic dysphemism, synecdoche, were disappeared. Thus, the results suggest that there was no difference in category of political euphemism between Indonesian and American. Of the twelve categories of euphemisms, seven categories appeared in both the texts of Indonesian and American. Secondly, the Indonesian and American political euphemism only differ in usage, degree of politeness, illocutionary transparency, sentence construction, social status, the choice of perspective. Thirdlv, both Indonesian and American euphemisms do not differ in function, interpretation, style(s), syntactic structure, sources, categories and underlying principle and values. The results lead us to believe that the difference is on the content of political euphemism rather than on the form.

The specific findings of the study were as follows. Firstly, the differences are only in the attitude and feelings toward the norms and values of each country. More specifically, in terms of lexicon: American use long winded construction, whereas Indonesian use simply plain construction, in

relation to grammar: voice, Indonesian uses passive voice more often instead of active in terms of politeness, whereas American uses active voice in achieving the politeness. Tense, American uses present perfect in achieving the politeness instead of present tense.

Furthermore, in line with the function of political euphemism, the Indonesian political euphemisms and American English euphemisms do not differ in terms of the functions. In other words, they are the same in functions according to the classification of textual function by Halliday. The text functions of political euphemisms are classified according to the way in which they contribute to the content of the text. In the text under consideration, four functions are seen, according to whether the expression primarily informs (conveys new information), evaluates (conveys writer's opinion or attitude), modalizes (conveys writer's attitude toward the truth-value of his utterance or writing), or organizes and functions as a discourse signal. To these four functions may be added a fifth, the political euphemisms that show a reader's reaction to something in the linguistic situations, namely apology, denial, convince, request and criticism, curse, question. With respect to the denial, the findings suggest that there are several subcategories of denial such as background information, text processed-information, unfulfillcd expectation, comparison and contrast, reason and apology, correction, condition, comment, saying thank as a refusal and covert please.

With regard to the styles in political euphemism, the Indonesian political euphemism and American English political euphemisms do not differ, and the four styles appeared in the text, such as formal, consultative, casual and intimate, only one of the five did not appear that is a frozen style. Next, the finding reveals Indonesian and American political euphemisms are similar in the sources like religion, biology, mechanic and kinship as reJlected in the political euphemism corpora. With regard to the choice of perspective, the result shows that Indonesian and American perspective in political euphemism differ. There are three perspectives, which are different. They are grammatical, rhetorical and contextual perspectives.

On the basis of the finding, political euphemism is not necessary as a political euphemism in all contexts. Political euphemism is used to fog up communication. In addition, these findings provide evidence that each country has culture-specific connotation. Indonesian politician more often violates the cooperative principle rather than American politician. The results suggest that the presence of unique sets of cross-cultural variation can be used to explain the problem of specific connotation and its political euphemism.

There are some implications. First of all, to the curriculum designer, the material designer and syllabus writer could give the place of covert grammar and political euphemism in the English and Indonesian teaching and learning interaction. Second, to the English discourse analysis teacher, it is worth noting that discourse analysis is one of the methods to analyze the Indonesian and American euphemism. Third, it is recommended that the intercultural euphemism research be more intensively conducted so that it can eliminate the possible misunderstanding because of political euphemism. Fourth, to the language learners, since language cannot be separated from the culture of its native speakers, language learners need to be familiar with the culture of the native speakers as the target language and euphemism is culturally bound, language learners need also to be familiar with it. Fourth, the principle of rukun (live in harmony) or of conflict avoidance needs to be disseminated nationally or internationally for the sake of maintaining the world peace. At last, a comparative study of euphemistic uses in Indonesian and American may also be useful to give us insight as to whether or not euphemism plays an important role in intercultural communication as the diplomats do in cross-cultural communication.

Categories

The study reveals that Indonesian and American political euphemisms are similar in kinds rather than in degree. For example, Indonesian political euphemisms are in the forms of metaphors, such as otak kekerasan di Aceh: Pak Harto, rapot merah Habibie, Gus Dur tidak dapat rapor merah namun cuci piring, they are the same as those found in American political euphemisms, such as kick the 6ucket, in the hands of congress. Aside from the form of metaphor, the other fonns such as hyperbole, denial, acronym and borrowed terms are also found in either Indonesian or American euphemism. In short, Indonesian and American political

euphemisnis do not differ in categories. It means that to a greater cxtent, every language does not differ in categories or the forms of political euphemism but they differ in other aspects. This is because euphemism is universal. Another reason is that although euphemism is universal, it has a culture-specific connotation. In other words, it is culturally bound or it is context-dependent. Furthermore, with respect of the content of the political euphemism, Indonesian political euphemisms tend to be high context culture, whereas American political euphemisms tend to be low context culture.

In response to the first question, the similarity and difference in categories of euphemisms found in Indonesian and American political euphemism are put fonvard: First, the Indonesian political euphemisms are presented, then the American political euphemisms are compared. The corpora no: 1, 2 written by Indonesian and American writers in the respective languages illustrate the kind of denial.

(1) Text 129 (IND129) *Surya* November 27, 1999: pagel5, column3

Hamzah Haz Kaget `Dicopot'
GUS DUR: TIDAK TERKAIT KKN
Surabaya, Surya
Presiden K.H Abdurrahman Wahid membuat kejutan lagi, Dr. Hamzah Haz yang baru sebulan menjadi Menko Kesra/Taskin, Jumat (26/11) kemarin diganti Prof. Dr. Basri Hasanudin. Pergantian yang diumumkan sendiri oleh Gus Dur di Istana Negara itu membuat kaget Hamzah Haz.
Hamzah kaget terhadap pemyataan diterimanya pengunduran dirinya oleh Gus Dur, padahal dia tidak dihubungi (lagi) sebelumnya," kata Faisal Basir Ketua PPP, di DPR, seusai bertemu Hamzah Haz. Setelah itu Hamzah Haz menemui Gus Dur untuk mengclearkan bahwa dirinya tidak terlibat KKN.

(2) Text 80 (USA80) Washington Post August 30, 99 Vol. 154. No.9 Just Say No
BY JAMES CARVILLE
What I want to say to the press is "Don't ask." And what I want to say to George W. is "Don't tell." I don't have any confidence that the press will take my advice. Like drunks, they vow every four years to stop covering scandal. They go up to Harvard to dry out, and then they come back craving more. But I think the Governor just might listen to me, not only because my wife Mary is a friend of his and a supporter but because I've seen my share of scandals. So why should he keep quiet? Because once you start answering, you're never going to be able to stop. Cocaine? How many times did you do it? Where? Who was your source? (That person might still be at large!) It's like an elevator that has no down button. It just gets higher and higher. They'll try to trick you into answering questions. First they'll say, "It's not about drugs; it's about"--fill in the blank. It's about "judgment" or "honesty" or "security clearances." Forget it. It's always about the drugs. The other thing is not to be seduced by the claim that if you just answer this one question, it will all be over. The next time you get a drug question the only appropriate answer is, What part of no don't you understand?

As can be seen from the corpora in the political texts C, D. Indonesian political euphemism is in the metaphorical form, and is employed frequently. While in American political euphemism, the form of metaphorical euphemism also exists as it can be seen in the text C, and text D in the appendices C. Textsl, 2, and D.Texts 6,8. To summarize, the Indonesian political euphemism uses those seven categories. In addition, the American politician euphemism also uscs the seven categories. It appears that the American tends to use the same categories as do the Indonesians. These results can be explained by considering the associative meanings in the context of political euphemism. And this is consistent with the earlier findings suggesting that those seven categories appear in the politican euphemism (Hoggart, 1985). Table 4.2 illustrates the kinds of political euphemism in Indonesian and American.

Viewed from the above table, the category concerning both the dead and fresh political euphemisms appears in the political corpora. For example, resesi, memancing di air keruh as dead euphemisms are still used in this refotm era. Corpus no3 represents the kind of dead euphemism, namely imperialisme.

(3) Text2-3(ItiD24)Tokoh. 27 September, 99: Hal 5, kol 1. Permadhi SH Ganyang neo-Imperialisme

Perspective

With regard to the choice of perspective, the result is congruent with Blum Kulka's (1989), Ewald's (1983), Fowler's (1986)findings. They find that there are three perspectives, like grammatical, rhetorical (psychological), contextual (spatio temporal) and or ideological perspectives. For example, the perspective of government, Indonesian political euphemisms are writer-oriented, such as " perusuh, gerakan

pengacau" Aceh. As a matter of fact, the writer is not on the perspective of the members of GAM, in other words, He argues for the government. Furthermore, particular political euphemistic expression is a euphemism for insiders (ingroupers) but it is a dysphemism for outsiders (outgroupers). Consider the example. GAM has a deterrent (euphemism) against the government as GAM's opponent threat (dysphemism). in addition, when it is in the perspective of the society or GAM members, they use the euphemisms such as, "dernonstran, arnuk massa, perusuh, gerakan Aceh merdeka". They are not the same as those found in American political euphemisms, such as "Would you lend me your money?" "Could I borrow your money?" Aside from the writer and reader, some grammatical sentences are used to make the sentences more polite. The data from both Indonesian and American euphemism suggest that every language differ in the choice of perspective in other words, the context determines the choice of perspective.

The results of this study on the specific aspects of perspective are consistent with BIum-Kulka (1989). The Indonesian and American political euphemisms differ in the choice of perspective. The difference is Indonesian euphemism is writer- oriented whereas American is reader-oriented. For example, "perusuh di Aceh or pengacau keamanan" is used when it is in the government perspective. Conversely, in the society's perspective or reader-oriented, it is called " tabligh Akbar". On the basis of these findings, it is likely that the political euphemism differs in the choice of perspective.

Usage

In terms of the aspect of usage, this finding accords with Kuntoro's (1999) finding. The finding indicates that Indonesian frequently uses passive voice, instead of active voice in achieving the politeness. E.g. "Bapak President dimohon untuk tidak membuat pernyataan kontroversial lagi", whereas in American they say, "I request you to take the seat or please, sit down", although" please be seated" is also used, it is, however, rarely used in the daily conversation. Once in a while, American uses article `the' instead of `our'. For example, it is the government, instead of our government, especially in the political campaign. While in Indonesian context, the article is used in

addressing someone: Bung, such as Bung Karno is used to achieve the politeness. This present study is similar to the finding of Tampubolon (1998). He asserts that euphemism should be political however, many political euphemisms are not polite. In contrast, Allan and Burridge (1991) find that political euphemism tends to deceive the public opinion and it is still euphemism. It means that the political euphemism has a certain construct. By political euphemism is meant the substitute of dispreferred expression to preferred expression with certain motivation from politeness to deception.

Principles and Values

As viewed from the aspects of the underlying principles for using the euphemism for both Indonesian and American, the present finding agrees with Kartomihardjo's (1979) and Suseno's (1993) finding. They claim that the principles and values of indirectness in Javanese are: 1) signs of education, 2) principle of social harmony, 3) principle of saving face, avoiding loss of face.

According to Kartomihardjo (1979:25-26), the basic value among Javanese is 'urip mapan" (live in harmony). He asserts that the basic theme which runs through Javanese ethical thought is the notion of an ordered universe in which everything is harmoniously placed in a location proper to it. Three values derived from the basic value "urip mapan are tepo sliro'(taking into account others as human beings), "toto tenterein" (in order and at peace). Compared to what is stated by Kartomihardjo above, the term "hormat" in the present study is approximately similar to "andhapasor", conflict avoidance is similar to "toto tentrem", and "empan papan" is the same as "urip mapan".

CONCLUSION

In short, more specifically, the cross-cultural pragmatic discourse should be developed and administered by including the context and circumstances. The cross-cultural pragmatic test in this article focused on the similarities and differences between Indonesian and American English euphemisms. by including the political context and circumstances written in the news media. Of the twelve categories of euphemisms, the hyperbole, denial, acronym, borrowed terms frequently appear in the texts in the respective languages. The data from

Indonesian and American English political euphemistic corpora suggest that there is no difference in form and function but they differ in degree of politeness. In addition, this is because what is polite in one culture is not polite in other culture. Indonesian politician prefers a hyperbole too. For example, "berpulang kerahmatullah". Indonesian borrows the word "crony" from American euphemism. Once in a while the euphemism exists in Bahasa Indonesia, but it does not exist in American Euphemism., For example, the euphemism "pecundang" means "loser, in American, it does not exist, or it is direct to say "lose" and or "loser". In addition, the taboo term sex, on "seN education" it is too direct to name, but in Bahasa Indonesia, there is a euphemism for that term, namely "pendidikan reproduksi". Therefore, the word "sex" is not common anymore. Another example is blue film, pornographic film, is called" in Indonesian "film orang dewasa". In US, it is called adult film and adult book for pornographic book. One possible conclusion is that the forms and categories of Indonesian and American political euphemisms under study do not differ but they differ in the content. And the intention in avoiding the loss of face may have compensated the uses of those political euphemisms.

In response to the research question about the functions of euphemisms, the Indonesian political euphemisms and American English euphemisms do not differ in terms of the functions. In other words, the results of this study are similar to the findings of Halliday and Rasan (1992, 1976) and Moon (see Coulthard, 1994) who state the te functions are decided with respect to the ideational and interpersonal components: ideational function like logical(organizational), experiential (informational), and interpersonal like situational, evaluative and modalizing, the current study finds that political euphemisms are decided in relation to ideational, like interpersonal and textual function. To these functions may be added other functions, that show a reader's reaction to something in the extralinguistic situations, namely apology, denial, convince, curse, request, criticism and question. On the basis of the findings, it can be generalized that the political euphemisms are commonly used almost in all language functions. In general, Indonesian and American English euphemisms do not differ in function, they differ on meaning .

This finding, to a certain extent, means that there are twelve categories of 1) Background information. Pak Harto said: Saya tak punya sutu senpun is and there no tax cut, If I am a President of'USA. Bush said, 2) Text processed tion. E.g. Golkar tidak pecah tapi hanya beda pendapat. Next, Amien Rais said:Perte muan kami bukan di belakang layar. There is disagreement in the Pentagon Kasovo. Cohen said.3) Unfulfilled expectation. E.g. Tidak ada merdeka untuk Aceh. There is no air strike on Suddam Hussein. Clinton said, 4) Compare and . E.g Soeharto said: Data Time itu tidak benar. Albright's statement about o is not right, 5) Modality. E. g. The nuclear weapon may be not so dangerous. Dur said: Belum tentu terlibat KKN 3 menteri itu, 6) Apology. Please, apologize army troop for the bombing. Thai is an accident. Clinton .said. Maqf atas pengeboman duta China dan kejadian itu merupakan kecelakaan. Maaf Akbar Tanjung atas kesalahun Golkar di masa lampau. 7} Please, as a refusal such as said: Silakan Protes, mereka kan tidak tahu persoalannya. Begitu aja kok, 'please, make a fair election if you want an IMF loan. Albright said, 8) as a refusal. Take the example of President Richard M, Nixon, who shortly resigning as President of the United States said at a press conference, " I am not a crook ". Instead of saying " I am an honest man ". Next, Gus Dur said. "Perlu semprotan pada tetangga untuk memadamkan gejolak di Aceh, 9) Correction Golkar tidak pecah, hanya berbedas pendapat. Akbar said. There is no comment about Kosovo. Cohen said., 10) Condition as refusal. Habibie said: "Saya bersedia mundur asal kanstitutional". Please, settle Buloggate, if you want the fresh money from IMF. Albright said, 11) Alternative as refusal. Megawati masih bisa jadi bersatu sungguhpun tidak menjadi ketua umum PDl-P. AL-Gore can be a president of the USA, as long as he is a green state. (:Bill Clinton said., 12) Thank as a "Terima kasih atas kritikannya terhadap Golkar". Akbar Tanjung said. There is indication that political euphemism is a kind of an avoidance language and evasive on. In the trade of politics, euphemism is a good instrument of denial and or refusal. This study examined the aspect of political euphemistic sources. Indonesian and American English political euphemism has similar sources as reflected in the corpus. First is religion. For instance, Indonesian political euphemism uses some obtained

from religious source (God sovereignty such as "Khilafah")., G 88 means emerging country : negara miskin.

SELF REGULATED LEARNING TO INCREASE LEARNING OUTCOME FOR STUDENTS OF JUNIOR HIGH SCHOOL

Said Alhadi; Bambang Budi Wiyono; Tryono; Nur Hidayah

Ahmad Dahlan University, Yogyakarta, Indonesia

Email: …

ABSTRACT

Self-regulated learning is very important for learning process in the schools. Because,The regulation of the students involved three important aspects, they are (1) metacognitive, (2) motivation, and (3) behavior. If these aspects regulation of students is achieved, it can support student achievement. It is needed to be applied for student through the implementation process of the guidance and counseling program. If students can be actively involved in the learning activity, it can generate ideas, feelings, and actions to achieve learning outcome. The Student learning outcome is maximum learning achievement and the learning outcome maximum. So, it is function of the counselor to improve self-regulation of students in learning through the process of guidance and counseling program.

Keywords *self regulated learning; learning outcome, self regulated learning*

The development of science and technology is growing and evolving rythm with populations, it is also including in the learning process. Of course,It will have implicated for the students who were still studying, such as the students of junior high school. They need to prepare themselves, so that one day they become a person who is able to compete in national and international.

It is undeniable that education is one of the main factors to make human resources into competitive forces that are able to compete. Now, Indonesia is entering the era of AEC (ASEAN Economic Community). Inevitably, The perfect education is everyone goals as the effort to support the human beings who are able to compete at National and International level. Competitive resource require hardwork from many part, such as the parents, the students themselves, the public, and no less important is the educational institution, which it is the Junior High School (SMP). Because of the scale of this school, the students are in the transition from childhood to the teenage years.

One part that can be maximized by the school to improve student learning outcome for Junior High School is self-regulated learning. Self-regulated learning is very important in learning process in the schools. Self-regulation can be described as an activity of students in achieving a goal. Because, self-regulation can establish themselves in determining the attitude, especially for students in achieving maximum learning outcome.

According to Mukhid (2008) that self-regulated learning are generally characterized as active participants who control efficiently the learning experience of their own different ways, include determining the productive work environment and using resources effectively, organizing and training information to learn, maintain a positive emotional during academic tasks, and maintain a positive motivational thinking about their capabilities, the value of learning, and the factors that affect learning. Self-regulation (self-regulation learners) through experience and self reflection (self-reflection).

Meanwhile, according to Donker, etc (2013) self-regulation in learning is a complex process, because it consists cognitive, motivational and contextual elements. Thus, the learners who have self-regulation will have a component of self-regulation that support learning outcomes, these are (1) the control of cognitive and cognitive regulation, (2) the regulation of motivation, (3) the regulation of behavior, and (4) the regulation of the context (Pintrich in Rachmah, 2015). So it can be seen that self-regulation covers three important aspects, namely (1) metacognitive, (2) motivation, and (3) behavior (Zimmerman in Ghufron, 2011).

There are several processes in the self-regulation of learning that needs to be done with the dimensions of the performance results, these are self-monitoring, self-judgment and self-control (Latipah: 2010). Furthermore, Zimmerman (1990) in Latipah (2010) identified some learning strategies commonly used by self-regulated learner, such as: self-evaluation; organizing transforming; goal setting and planning; seeking information; making and checking records (keeping records and monitoring); set the environment (environmental structuring); self concequences; rehearsing and memorizing; looking for some help (seeking social assistance) to peers, teachers, or other people; and

also reviewing notes and textbooks (review records).

Related to student achievement, so self-regulation in learning is a process that helps a person manage itself primarily in terms of learning that involves thoughts and actions with the aim of winning the desired target. The main applications of self-regulation in learning strategy is planning, monitoring, capable of completing various tasks in the classroom, and evaluate student learning outcomes. In this regard, teachers have an important role in guiding and control the students. To improve self-regulation in learning, teachers must teach students the kinds of cognitive processes that can help learning and memorable.

The changing process in human personality through improving the quality and quantity of behavior, skills, knowledge, thinking skills, and other capabilities. In the changing process can be obtained learning outcome suitable the studied program. Morgan (2000) explains that the changing caused from learning will be indicated by the learning outcomes. The purpose of learning outcomes to obtain information about the effectiveness of the learning process, while learning results obtained will provide information from the method applied learning will provide positive results in achieving optimal learning goals.

Sudjana (2003) said that the learning outcome is changing in behavior which covers the areas of cognitive, affective, and psychomotor owned by students after receiving a learning experience. Gagne (1985) said that student learning outcome acquired abilities of students in learning activities. For the measurement of learning outcomes of Gagne's theory suggests five aspects: (a) intellectual skills skills; (b) verbal information; (c) cognitive strategies; (d) attitude attitude directed through learning activities; and (e) the ability of the motor.

According to Bandura (Alwisol, 2009: 357) self-regulation is the ability of human beings or individuals ability to think, and with them, their ability to manipulate the environment, so it caused the changes in the environment as a result of that desire. Meanwhile, According Donker, etc (2013) self-regulation in learning is a complex process, because it consists of cognitive, motivational and contextual elements. Metacognition is one of the processes that control these elements and the basis of self-regulation in learning.

Components of self-regulation in learning on learners consists of (1) the control of cognitive and cognitive regulation; a cognitive and metacognitive activities, (2) the regulation of motivation; include attempts to arrange a variety of motivational beliefs, behavior regulation; is an aspect of self-regulation that involves the efforts of individuals to control their own behavior, and (4) the regulation of the context; an attempt to control the context in the face of classroom learning (Pintrich in Rachmah, 2015). So it can be seen that self-regulation includes three aspects are applied in learning, they are metacognitive, motivation, and behavior (Zimmerman in Ghufron, 2011).Then, in the learning process to achieve learning goals, self-regulation in the study has three phases, that are :

(a) The Phase *forethought.* This phase along with its processes, be functioning to inforce the individuals commitment to act and prepare themself to do something that required in learning. This phase is divided into two main processes,they are task analysis and self-motivation. (b) The Phase *performance.* This phase helps the individual focus on individual tasks and assist in optimizing the performance of his study, which is divided into self-control and self-observation. (c) The Phase *self-reflection.* In this phase, the individual must make sense of their learning experience or to reflect on what he had done. The process in this phase consists of the process of self-assessment and self-reactions, (Zimmerman, 2011).

While Ormrod (2009: 38) explains that the process of self-regulation in the study of which is essentially metacognitive, regarding (1) the determination of the destination (goal setting), (2) planning (planning), (3) self-motivation (self-motivation), (4) control of attention (attention control), (5) use of learning strategies flexible (flexible use of learning strategies), (6) monitor themselves (self-monitoring), (7) proper help (appropriate help seeing), (8) self-evaluation (self-evaluation).

DISCUSSION

Good education is the desire of the government as the effort to support the creation of quality human. This is accordancing with the President's program that embodied in Nawa Cita Jokowi - Jusuf Kalla 2014-2019, which said, "improving the quality of Indonesian human life". Improving the quality of Indonesian human has required improvements and performance enhancements in education. For example, the government's policy to raise the value of standardization graduation each year.

This is must be done because, in fact that has not been in line with expectations at the government. Indonesia's competitiveness according to the World Economic Forum (2007-2008) was at 54 of 131 countries. When viewed from the ASEAN countries is much lower below Malaysia was ranked 21th and Singapore order to 7. According to the report of the National exam

results in 2010 gained national exam students are less than 5 to mathematic is 9.07% english 6.95% 0.53% Indonesian. Thus, when compared with other areas of study it is clear that the results of student learning in mathematics is still low (Mustari, 2011).To overcome their fear of learning outcomes, it is required preparation of the various components, one of which is the development of self-regulated learning in self-learners.

It was explained that one of the things that affect the outcome of learning is self-regulated learning. Self-regulation in learning is the ability, responsibility, and one's strategy to regulate and manage itself in terms of learning. This ability is a combination of knowledge, attitude, and behavior that comes from within themselves to continue to develop themselves and achieve a desired goal that is monitored by himself from the process until the result.

Self-regulation includes in three aspect that is applied in the study, namely metacognitive, motivation, and behavior. The process of self-regulation in the study which is essentially metacognitive, as follows: (1) Setting goals (goal setting), (2) Planning (Planning), (3) Self-motivation (Self-motivation), (4) Control of attention (Attention control), (5) the use of learning strategies flexible (flexible use of learning strategies), (6) Monitor self (self-monitoring), (7) Finding the right help (appropriate help seeing), and (8) Evaluate yourself (Self-evaluation).

Junior high school students as a target service from BK teachers are one of them in learning part. BK teachers serves to set the students' learning process starting from the motivation, set a strategy in learning, determining the specific method, carry out the task or homework the teacher, monitor learning outcomes, and evaluate student learning outcomes. This service is provided to students so that students are able to become active learners for himself, also set itself especially in terms of learning. Which is all of that will be used as a preparation for their future.

Students who have self-regulation in a good learning is the students who are active in the learning process, both metacognitive, motivational, and behavioral effects. They produce ideas, feelings, and actions to achieve learning goals. Metacognitively they could have a particular strategy that is effective in processing information. While the motivation is about the spirit of learning that are internal feeling. As for behavior, the display is in the form of concrete actions in the study.

CONCLUSION

Now, Indonesia is competing with other developed countries, especially MEA competition is in sight. To be able to compete with other ASIA countries, governments do a variety of ways to boost the quality of Human Resources competitive. One of them is the boost that junior high student learning outcomes can be gradually increasing. One strategy that can be etched to improve student learning outcomes are educational institutions which in this case is a Junior High School (SMP) to maximize the performance of counselors to design guidance and counseling program for developing self-regulated learning in junior high school student. The assumption is that if the student has self-regulated learning, then students will also be able to improve student learning outcomes.

TEACHER CAREER DEVELOPMENT THROUGH PROFESSIONAL COMPETENCE TO IMPROVE THE QUALITY OF TEACHER

Samsilayurni
University of Muhammadiyah Palembang, Indonesia
e-mail: samsila.yurni@gmail.com

ABSTRACT

The improvement of teacher professional competence is career development process which is an important component for teachers in educational system. Teachers are required to be able to become a whole person, where the teacher serves as a facilitator, motivator, and dimanisator in the instructional process of students or learners. The realization of these functions is not easy, a lot of challenges to be faced by a teacher and lecturer. The purpose of enhancing professional competence of teachers is done by a series of career guidance in accordance with the demands of quality development. In carrying out its function as a functional position, a teacher is able to carry out good, qualified, professional functions as career guidelines. There are several steps that can be done by teachers and lecturers in implementing development guidance which are included in four teachers' competencies, namely, (1). Pedagogic competency, (2). Personality competency, (3). Social competency, and (4). Professional competency. However, 10 teacher professional competencies that are well-known competencies are outlined in PP. Number 74 of 2008. Therefore, these efforts which are to increase the quality of teachers' professional competence are similar to teachers' efforts in carrying out the process of career development.

Keywords:career, quality, competency, professional

National education serves to develop skills, increase character development, and build civilization dignity in order to educate people which aims to develop students' potentials to have strong faith to God, high noble, healthy, knowledgeable, skilled, creative, independent , and high democratic and accountable students. To reach those educational objectives, it should be preceded by adequate education process. Thus the education process can run well which all the aspects could affect student learning that give positive feedback for the students in improving the quality of education. In globalization era, formal educational institutions carry out the important tasks to prepare the quality of Indonesia's human resources (HR) in the future. In school environment (education as schooling), the professional teachers hold the key to improve the quality of human resources in future. Professional teachers are the one who perform the duties and functions to improve the knowledge, skills, and attitudes of students as the future of Indonesia's human assets.

According to Law No. 20 of 2003, National Educational System is to guide the government to engage the society and educational institutions to have primary and secondary education level to the tertiary level. This society involvement includes some aspects of planning, implementating, monitoring, and evaluating of educational programs (Law No. 20 Th., 2003, chapter 8), it also includes the obligation to provide human resources to support the education in Indonesia. Teachers as an important component in the educational system are expected to be a facilitator, motivator and dynamic factor for students learning process. Therefore, teachers are required to have competence in education. In the framework of the implementation of the curriculum, the need for teaching methods should be appropriate subjects taught by each teacher. Thus the learning process will go hand in hand with the development aspects of student learning which includes cognitive, affective and psychomotor aspects. To realize the good intentions contained of Law Number 20 of 2003, it needs the commitment from all parties, especially the government in accommodating the teachers' career development in accordance with Article 40 paragraph (1)c. career coaching in accordance with the demands of quality development.The objectives of this study are:

a. To know and to understand the definition of career development
b. To know and to understand the quality of teachers' professional competence
c. To know the effects of professional quality on the teachers' career development

Teachers' Career Development
Career Understanding

According to Kamus Besar Bahasa Indonesia (KBBI) as the Center for Language Education Department of National, character means the psychiatric, akhlaq, or character components that distinguish one to another, or it could mean significant congenital, heart, soul, personality, behavior and personality traits, and temperament character. Thus, the character is a way of thinking and acting to live and work which is approtpriate to

each personal characteristics within the family, society, state and nation. Good personality persons are the persons who could make decisions and are ready to responsible for every decisions they made. According to Majid (2011), character ethymologycally is derived from the Latin namely kharakter, kharassaein, and kharax. Also according to the Greek, character namely charassein which means to make sharp and to make the inside. Meanwhile, the word character which is derived from English is commonly used in Indonesia. Then, according to Hornby and Parnwell, character is mental or moral quality, moral strength, and the name or reputation. Then Simon Philips also stated character is a set of values that lead to a system, which underlies the thinking, attitudes, and behavior displayed. Doni Koesoema A defined characters can be understood the same personality. This personality can be regarded as human's style or characteristic which comes from the formations that is received from the environment. Some understanding of those definitions can be concluded that the condition of natural character exists in every human's soul thus this character is different to one another. The understanding of personality sense, characteristics, and the characters are often swapped at one time. This is not quite strange when the person considers to say the word characteristic, personality, and character have the same meaning at the same time because the interpretation of those terms are quite same.

Teachers career development

According to Sigit (2003), career development (career development) is literally definedas demanding person to make decisions and commit itself to achieve career goals. In general the definition of career development is the increase o f career position which is based on person's achievement, workload, and opportunities work, therefore teachers career development should be pursued by the organization concerned, namely Education and Culture Department. Then, H. Baedhowi (2010) stated Educational career development training should implement to the framework of promotional and functional positions in which the inherent capabilities and should look at the professional performances. Therefore, this training is the effort to help teachers as educators to promote their positions through the credit pooling rate of functional position. The increase of those credits must indicate the increasing of teachers' performance as the professional teachers.

2.2 Improving the Quality of Teacher Professional Competency

Teacher Professional Development

Indonesian Government Regulation No. 74 of 2008 on Teachers states teacher professional development is to develop and increase the competencies associated with the acquisition of teachers' credit rate of functional position. The activities of professional development carried out through ten different types of activities, namely (1) the collective of teachers' activities which improves their competencies and / or their profession, (2) education and training, (3) apprenticeship, (4) scientific publications on the results of research or innovative ideas, (5) innovative works, (6) presentation at scientific forums, (7) the publication of textbooks or books enrichment, (8) the publication of teachers' manuals, (9) the publication of field experience, and (10) awards for accomplishments or dedication as a teacher. From those ten professional developments above, the National Ministry through the Directorate General of Quality of Teachers' Improvement and Education Personnel (2010) has emphasized three things, they are 1) implementation of self-development, 2) implementation of scientific publications, 3) implementation of innovative work. Castallo (1992) stated professional development and career planning should be run by teachers individually and it should not run by the organization or school especially by the school's principle. School or the principal only facilitates the development, but the initiative and commitment must come from teachers themselves. But teachers and school institutions are together mutually run the effort to support and integrate for the successful of professional development program. In addition, to support the professional development programs, teachers are also encouraged to understand the rules associated with it, including (1) Regulation of National Education Ministry Number 35 of 2010 Concerning Technical Guidelines for Functional Master and Credit Figures; (2) Regulation of National Education Ministry joining withNurul Ulfatin, Teacher: Career Development or Profession Development, Head of State Personnel Board Number: 03 / V / Pb / 2010, and Number 14 of 2010 Concerning the Implementation Guidelines Functional Master and credit figures; (3) National Education Minister Regulation Number 38, 2010 Adjustments Functional Master; and (4) Regulation of State Ministry for Administrative Reform and Bureaucratic Reform Number 16 of 2009 on Functional Master and credit figures. Then, before the teacher must first understand the legislation underlying which are (1) the Act of Number 20 of 2003 on National Education System; (2) Lawof

Number 14 of 2003 on Teachers and Lecturers; (3) Government Regulation Number 19 of 2005 on National Education Standards; and (4) Government Regulation Number 74 of 2008 on Guru.Fokus PKB in Scientific Publications.

Teacher Professional Development Program

Indonesian government, especially the Ministry of National Education, revitalize the performance of teachers by tightening the requirements for anyone who wants to pursue a professional career in the field of education. With the minimum qualification requirements as stipulated in Law Number 14 of 2005, teachers are expected to really have the competence as a learning agent. Mulyasa E. (2008) mentioned teachers' competencies include pedagogical competence, personal competence, professional competence and social competence, where those are expected to be obtained fully through professional education. According Supratno (2006), to support the achievement of an increase in the professionalism of teachers, the government in this case MONE facilitates the educational activities through:

a). improving the quality of teachers through the implementation of affirmative action in each educational level, b). increasing the teachers' professionalism through upgrading / training cooperate with institutions or eductaional training, c). motivating teachers through the development of teachers' group work such as PKG, PSB SPKG, PPPG, etc., d). accommodating arrangement/ equalization of the number of teachers with the credit total of subjects they get which is appropriate to curriculum need, e). subsidizing helping teachers and fostering teachers' quality of each schools, especially private school, f). conducting the guidance of teachers' career according to teachers' functional level, and g). attempting to improve teachers' professionalism through variety ways periodically.

According to Law Regulation number 14 of 2005 on teachers and lecturers as well as PP Number 74 of 2008 regarding the educational qualification which teachers should have at least S1 / D-IV as their educational background and for non-teachers which are qualified as a teacher. Some legal mandates of two products are:
1. The Candidates of educational profession must be qualified to S1 / D-IV
2. Teachers' certificate should be obtained from an accredited college

3. Teachers' certificate for teacher candidates should be conducted objectively, transparently, and responsibly
4. Teacher professional education programs is designated by ministry of education
5. Teacher professional education program concludes with the test of teachers' competency
6. Teachers' competency test is done through a written test and performance test which accordance to standard competencies.
7. The written test should be compreherensif that includes the understanding on students, curriculum development, instructional design, evaluation, subject matter, and the concept of scientific disciplines.
8. The performance test is done holistically in terms of learning practice test that reflects the mastery of relevant, pedagogical, personal, professional, and social.

The Quality of Teacher Competency

McShane, Glinow in Martinis Yamin, (2010) stated competencies are the skills, knowledge, talent, values, drivers and other personal character that lead to the excellentperformance . Then there are some experts have a concept of competency which is often called by the term "ability" or capability that includes natural talents, and this ability can be learned by doing required task, especially the teacher's task. Gibson, (2006) explained that the abilities and skill are an innate ability or something that can be learned to complete one's duties. Wikipedia, (2006) definde the word competency as something which is standardized as the requirements of an individual to perform a specific job. Johnoson in Martini (2010) described the components of teacher competency include performance, knowledge, skills, processes, adjustment, and attitudes, values and appreciation. Law Regulation on Teachers and Lecturers Number 14/2005 and Government Regulation Number 19/2005 states teachers' competency include personality, paedagogic, professional and social affairs.Therefore, according to explanation above, it can be concluded thatteachers' professional competence is the ability, the expertise, skills and knowledge possessed by a good teacher which can be obtained from natural ability or through the acquired process of teacher training. The components of teachers' professional competency can be reflected through: 1) the mastery of science or subject matter that is broad and deep, 2) understanding the sciences related to educational matters such as educational philosophy, educational psychology, didactic-methodical, management planning, teaching and evaluation of education, 3) teachers' properties, 4) full attention to students' development, 4) well-

communication in transferring subject matter, and 5) as the researcher. Then the teachers must really concern to improve their quality through those five componenta because those components are proposed to make teachers become professional. Suparno (2000) said that improving teachers' competency could be implemented through the strategies / efforts in the form of educational training (training) such as a). In-house training (IHT), b). The internship program, c). Schools partnership, d). Distance learning, e). Gradual training and particular training, f). A short course in LPTK or other educational institutions. g). Internal coaching by school, and h). Advanced training . The implementation of these strategies contributes to increase the number of teacher coaching who can assist other candidate teachers in teacher professional development. Then there are another strategies or efforts which contribute to improve the quality of teacher professional competencies which are: a).discussing educational problems, b). having Seminar of education, c).joining educational workshop, d).conducting research in educational field, e) writing books / materials, f).preparing instructional media, and g). creating technology work/artwork.

CONCLUSION & RECOMMENDATION
Conclusion

National education serves to develop skills, increase character development, and build civilization dignity in order to educate people which aims to develop students' potentials to have strong faith to God, high noble, healthy, knowledgeable, skilled, creative, independent , and high democratic and accountable students. To reach those educational objectives, it should be preceded by adequate education process. One such process is teacher career development as the educators which is implemented through promotion of functional position in which the inherent to capabilities of their professional performance. Therefore, the constructions of teacher career development are to be planned to help teachers be well-qualified. This promotion should indicate the increasing performance abilities as the professional teacher. Professional teachers should have the some competencies such as pedagogical competence, personal competence, professional competence and social competence which are expected to be obtained through fully professional training. In order to improve the quality of professional competency, this competencies can be obtained through educational training for instance: a). Discussing educational problems, b). Having Seminar of

education, c). Joining educational workshop, d). Conducting research in educational field, e). Writing books / materials, f). Preparing instructional media, and g). Creating technology work/artwork.

Recommendation
1. Improving the quality of teacher professional development should be planned and be implemented optimally to achieve the objectives of qualified teachers who have high competencies to produce professional teachers.
2. The development or improvement of teachers' professionalism strategies should start from the awareness of teachers themselves to always strive to develop itself into a better.

DEVELOPMENT OF LEARNING SOURCES BASED ON THE CHARACTER EDUCATION ON MATHEMATIC LESSON IN CLASS VIII OF SMPN 1 TULUNGAGUNG

Samsul Bakri

IAIN Tulungagung, Indonesia

Emaial: ………

ABSTRACT

This article is a research and development of learning resources based on character education that uses the principles of product development from Borg & Gall, which include: the introduction, development, field testing and dissemination. By using the steps in the research and development, program development model of learning and development steps of learning resources, can be produced based on learning resources for character education on mathematic courses is effective in class VIII. The quality of learning resources based on character education in the results of this development, of the various aspects can be expressed either. The use of learning resources based character education can impact both on learning outcomes, and affective aspects of learners, namely to instill and internalize the character values through learning mathematic.

Keywords: *learning sources, character education*

Teaching and learning has normative value in a natural interaction. Moreover, teaching and learning is an awareness process that has the certain objective in it. The objective of the study is like a compass to where the teaching and learning will be direct to. Therefore, the process of teaching and learning has been success if it can change students' knowledge, comprehension, and skill (Djamarah, 2000: 12). In line with Djamarah & Zain (2006: 39) stated that the nature of learning is 'change' and the nature of teaching is process of teacher's arrangement. Then, it can be sum that the teaching and learning is the interaction between the teacher and the students in order to make change and arrangement to achieve the objectives.

Learning sources is all of the sources, human, environment, and technique that can be used by the students to help their learning. Moreover, it can be the sources from students' outside and it is possible to help the students in learning process. Learning sources, hence, can be intentional by design or can be already available and directly by utilization(Hendrikus, 2009: 26).

Quality of learning can be seen from the change of students' behavior. This change of behavior related to the change of students' character, and the change of students' character itself becomes the important point in 2015/ 2016 especially in Mathematic course.

Mathematic is a subject provides knowledge to make the students more conscious that they take responsibility on the next generation and Indonesian's fate. Consequently, nation character education in Mathematic lesson should be excessive in its course disseminationespecially on its learning sources. Ideally, learning sources of Mathematic reflect character values and culture in order to internalize them to the students.

Based on the a forementione dexplanation, the researcher intents to make research that focus on development of learning sources based on the character education on Mathematic lesson in class VIII of SMPN 1 Tulungagung.

METHOD

The design of this research is Research and Development (R&D). It carries out the product to develop learning sources based on the character education on Mathematic lesson that can bridge the gap of plenty research that test the theory to producing the products that can be easily used by many students.

Borg andGall (1983: 772) defines the approach of research and development in education as "a process used to develop and validate educational products". More detail in Gay (1990), stated thatthe approach of research and development is an effort to develop effective learning product in the form of learning materials, media, strategy, or other materials used in school that is not for testing theory. Based on the two opinions could be concise that research and development in the teaching and learning is a research approach that aims to develop and

validate products in teaching and learning to improve the quality of education efficiently and effectively (AnikGhufron, 2007).

The descriptive procedural model is the model of development that is used in this present research. This model, moreover, should follow the certain steps to develop the products of media teaching. The steps are; understanding the problem of learning, creating the product, and testing the product (trial and error). In this case, if the problem of learning can be conceptualized, the product of teaching can be started doing. However, if the conceptual of learning problem do not accept and understand yet, the process of making the product should be repeated. Therefore, this ideal model is suitable for applying in research and development to produce the product of learning sources based on the character education.

In addition, other model also used module in teaching and learning due to some reasons. The first, module can describe the process of learning appropriately and continuously. The second, module can boost students' learning motivation. The third, module can be used both in pair and group.The fourth, module can draw students' attention. The fifth, module can demonstrate complicated material; hence, teacher will easily explain it. The sixth, module can be used repeatedly.

Here are some considerations of using Borg & Gall Model (1983: 775) as this present research's foundation: firstly, this model has a distinct perspective theory base. Since, its theory establishes an optimal learning methodology. This method in line with the objective of this learning sources development. Moreover, the steps of this model development are very simple but it is not strict. Therefore, it is a right way to solve the problems of learning operationally.

In addition, the model development that used in this research was adapted from model of development proposed by Borg & Gall. According to Borg and Gall (1983) the approach of this study had a ten-step implementation. The steps of it were described as follow:

(1) Preliminary study and data collection (review of the literature, class observation, and providing research framework), (2) Planning (formulating research objective, estimates fund and time allocation, procedure of research, and various forms of participation activity during the research), (3) Develop the initial product (designing initial draft of product), (4) The first trial-error (made trial of the product to definite subject and area), (5) Revision from draft to main product (revised product based on the result of early trial), (6) Test to the main field (trial of revision product to boarder subject and area), (7) Revision for operational product, (8) The operational product testing (testing the effectiveness of product), (9) Revision for final product (revised product for being effective and adaptable one), and (10) Dissemination and implementation of research and development product including planning, developing, field testing and dissemination.

Producing a quality R&D product is also needed a quality instrument; hence, it would be able to explore what desired in the product development of PBK. Therefore, as a media product that requires time and high cost, the researcher collected the data with the instrument that often used by experts or stated in many literatures. They also validated by the material and media experts to make them appropriate in its using.

The development of instrument collecting data is used trough two phases, namely instrument preparation and instrument testing.

In this phase, both research instrument and questionnaire were prepared by the researcher; while, questionnaire was prepared based on the blueprintwhich was adapted from instrument of R&D conducted by the previous researcher and with necessary modification.

In this phase, the instrument was tested to obtain feedback for better improving. Therefore, it can be used as a valid measuring tool in research. In this study, a criterion to determine the quality of instrument is logical validity. In addition, the trial was intended to know respondents' understanding through the items and to know respondents' choice through the alternative answer of each item.

In addition to the above explanation that to ensure the instrument evaluation for media and material experts should have logically validity. Therefore, before the questioner was used for collecting data, it must be consulted to the media and material experts to obtain the improvement and feedback. While, evaluation instrument for the students was tested to some students. And the feedbacks from respondents could be used to revise the instrument.

The method and the instrument of data collection describe as follow: (1) collecting data based on the concept, the researcher conducted a discussion, submit the product and evaluation form to the experts to obtain feedbacks; (2) exploring the depth material through face validity and content validity, using questionnaire based on the Likert scale, discussing with the small respondents, and observing for field test; (3) collecting data related to effectiveness and efficiency of the product was made to assess the students' work and time to be used in field test; (4) knowing the aspects of students' attractiveness through direct observation; (5) increasing the students' achievement could be seen from pre-test and post-test.

By submitting students' feedbacks which be drawn in questionnaire and analyzing the percentage and categorizing it into descriptive statistics; would be analyzed and summarized to improve the product based on the character education. To determine the percentage of the students' achievement based on KKM is defined from pre-test and post-test. Therefore, the data are obtained into excel and SPSS version 12.

We often heard about terms related to learning sources and people have used it as easy as they like. However, many of them know the libarary is one and only the learning sources among it. Whereas, they did not aware about what they use and who they meet, are the learning sources itself.

Learning sources in bced website is defined as follow: Learning resources are defined as information, represented and stored in a variety of media and formats, that assists student learning as defined by provincial or local curricula. This includes but is not limited to, materials in print, video, and software formats, as well as combinations of these formats intended for use by teachers and students.

Learning sources also defined as information are presented and saved in madia that can help the students in their learning process. The form of learning sources can be in the form of printed, video, software or combination of various formats that can be used by both students and teachers.

In line with Sadiman, stated that learning sources as everything that can be used for learning, which can be person, objects, messages, materials, techniques, and setting (Sadiman, Arief S., Pendayagunaan Teknologi Informasi dan Komunikasi untuk Pembelajaran, article, 2004)

In more detail, based onAssociation for Educational Communications and Technology (AECT, 1977), learning sources is every sources that can be utilized by teachers, in the form of separation and combination, for the sake of teaching and learning with the purpose to increase the effectiveness of learning objective. Thus, the learning sources are also defined as any place or environment, objects, and those that contain the information can be used as a tool for students to change their behavior.

Based on the aformationed explanation, learning sources can be categorized into a) natural environment where is people learned and do the process of learning. It can be library, market, museum, river, mountain, rubbish box, fish pond, etc; b) objects are the things that may change the studnets' behavior, like archeological site, temple, and any relics; c) people are everyone who has certain competence so the students can learn the skill from him/her. For example, teachers, geologist, police, and other experts; d) substance is any material in the form of written, printed, recording, web and etc; e) book is any kinds of referencies that can be read independently by the students. Like textbook, dictionaries, encyclopedias, fictions and so on; f) facts and events that happened, for example riots, disasters, or other important events.

Learning sources will be meaningful to both teachers and students when it is organized through a design tah enable one to use it. If it is not, however, other material surrounds us can be learning sources.

The module is a written book used by students to study independently without or with the teacher's guidance, so the module contains at least about learning instructure, basic competance, content, additional information, students' assigments, students' worksheet, evaluation, feedback.

A nodule can be meaningful when students can easily use it. Learning by module enable students with high achievement are faster in completing the base competence (KD) tha other students with low achievement. Therefore, the module should be described based competence (KD) to be achieved by students. It also presented using good language danillustrasion.

Jack Corley and Thomas Philip define character as the person's atitude and habits that make it possible to simplify the moral action (Samani&Hariyanto, 2012).Suyanto states character is a way of thinking and

behaving that is characteristic of each individual to live and work together both within the family, community, nation and the State (Muslich, 2011).So the character is a collection of values that lead to a system, which underlies the thinking, attitudes, and behavior displayed.According TadkiroatunMusfiroh, character refers to a set of attitudes (attitudes), behavioral (behaviors), motivation (motivations), and skills (skills).Character comes from the Greek word meaning "to mark" or mark and focus on how to apply the value of goodness in the form of action or behavior, so people who are dishonest, cruel, greedy and ugly behavior of other people say bad character.Conversely, people whose behavior in accordance with the moral code called a noble character (TPPK, 2011).

Character education is an effort to educate children in order to obtain decision wisely and practice it in our daily lives, so that they can make a positive contribution to the environment (Megawangi, 2004).According Scerenko, character education is an effort that is truly a way where the personality traits positively developed, encouraged and empowered by example, the study and practice of emulation (a maximum effort to realize the wisdom of what is observed and studied) (Samani&Hariyanto, 2012). The character education, in more detail, is a deliberate effort to develop good character(good character)based on the virtues of the core(core virtues)which is objectively both the individual and society (Lickona, et.all., 2005).

The purpose of education is to instill character and shape the nature or character derived from the trials, sacrifice, life experiences, and values implanted so as to form an intrinsic value that will be the students' attitude and behavior. The value invested in the form of attitudes and behavior of the given continuously so as to form a habit.And such practices will be of special characters for individuals or groups.

If you look at the historicity of character education in schools has a very long history.It has been practiced since ancient Greece, namely the time of Homer (Kosoema, 2011).In many places, the character education in schools had their ups and downs (Lickona, 1993).It happened in tune with the real struggles of society in which education takes place.Clearly, character education received great attention,

especially in communities that experience (and seeks rise of) moral bankruptcy (Berkowitz & Bier, 2005).

For example, in the United States, the emergence of the national movements of character education since the 1990s, could not be separated from awareness of the various parties to the signs of moral collapse of society in general and (especially) the moral youth (Lickona, 1991).At that time, they were very concerned about the increase in crime, suicide among adolescents, divorce, abortion, the habit of cheating among students, the habit of stealing goods in the store among teenagers, and others.On the other hand, many people believe that without the virtues that characterize the haik, people will not be truly happy life and society will not be able to function effectively (Lickona, 2004).The same thing is now happening in Indonesia.Various parties voiced about the importance of character education (at school).Character education is considered as one important way to overcome the moral decay of society that is already on the stage is very worrying.

FINDING AND DISCUSSION

Before use, the learning resources that are made to be reviewed by subject matter experts, linguists and experts also test character education.The trial was attended by 20 learners.Assessment of learners regarding aspects of learning shows that the media have good quality, including the categories "Good".A rating on this aspect includes 11 indicators that are reflected in the 11 items on the questionnaire.

Then do the operational field testing. The purpose of the operational field testing is to determine whether the products are already fit for use in the school without the presence of the developer.So that the product is feasible in operational use, the product packaging must be complete and already tested in any previous rules. Operational field testing has been tested on the general class and the situation is the same as in operational use in general.Feedback and suggestions learners in this phase will be used to revise the product to be the final product before it is distributed to users.

With respondents were 20 learners who provide feedback about the quality of learning resources mathematics from the learning aspect, material, character education and language, the result that the average score overall (the learning aspect, the

material aspects, character education and media aspects) with a grade of "B" , which means included in the category of "Good"

Generally the learners stated that this source of motivation and provide significant benefits in the process of learning mathematics.Based on the operational results of field testing above, can be explained as follows 1) all learners who were respondents in the trial court stated that the subjects of mathematics presented in the product easy to learn learning resources.(100%); 2) most of the learners who were respondents in the trial court stated that the concepts presented in the product easy to learn learning resources (85%).; 3) most of the learners who were respondents in the trial court stated that the subjects of mathematics presented in product sourcing learn to make the learners feel challenged to learn better because the material is relatively easy to learn and they can be actively involved in the learning process because it has been supplied worksheet which can be filled by learners.(90%); 4) all learners who were respondents in field trials stated that they want to learn a lot through the learning resources available.(100%); 5) most of the learners who were respondents in the trial court stated that by using these learning resources can be used as a way of cultivation of character values of the nation.(85%); 6) all learners who were respondents in field trials revealed that the source of this learning helps them to learn math.(100%); 7) all learners who were respondents in field trials suggest that they could measure their understanding by doing a matter of evaluation is provided for after all a matter of doing they can directly see the results.(100%); 8) most of the learners who were respondents in field trials suggest that they could be faster in learning mathematics through module provided.(85%); 9) all learners who were respondents in field trials stated that they were delighted to learn through a learning resource.(100%); 10) most of the learners who were respondents in field trials stated that they want to learn with learning resources that draw on other subjects.(90%); 11) only (25%) of learners who were respondents in field trials stated that they were confused and insecure if not accompanied at the time of learning with learning resources products.This means that 75% of learners feel able to learn independently with the product of learning resources.; 12) Most of the learners who were

respondents in the trial court stated that the worksheets provided they make the learning process more active and easier.(85%); 13) All learners who were respondents in the trial court stated that the presentation of the material with a variety of sources, such as text, images, tables, interesting.(100%); 14) only (15%) of learners who were respondents in the trial court stated that the instructions there to make them confused.The rest (85%) find it easy when using the product of learning resources so that the learning process can proceed smoothly.; 15) most of the learners who were respondents in field trials stated that they learn the material coherently.(90%); 16) in general it can be concluded that the learners can benefit by learning to use a character education based learning resources.Learners also become more motivated to learn the material presented.So the source of this learning has a positive contribution to the learning process.

After having held operational testing field, as already explained above to determine whether the use of the products of the development has a positive impact on learning outcomes expected.To know that, learners are given a pre-test and post-test to see if there is a significant improvement on learning outcomes for learners before and after using the product.Processing scores of pre-test and post-test is done with the help of Excel and SPSS program version 16, so that it can be done more quickly.By looking at the value of learners in post-test, it can be obtained the percentage of learners who achieve mastery learning with a minimum value of "70".

From the available data, it can be explained that the number of learners who achieve mastery learning (minimum value 70) after the learners using instructional media based character education, a total of 17 learners from 20 learners who take the test, so for 72.25% of learners who otherwise achieve mastery studying on certain materials in mathematics and included in the category of "Good".

From the data obtained, it can be concluded that the impact of using instructional media of mathematics courses based character education to improving the learning outcomes of learners in mathematics in the category of "good" by looking at the percentage of learners who achieve mastery learning of 72.25%.In addition, instructional media also managed to increase the

awareness of learners will be the values of national character in daily life.

After passing several tests, both the feasibility test is limited from subject matter experts, education experts characters and linguists, as well as field tests covering preliminary field testing, playing field testing, and operational field testing, product-based media education character of the development is already feasible into a final product that can be disseminated and implemented to users.The feasibility can be seen from the average ratings almost all stages, rated "B" categories "Good".This is consistent with the expectations of researchers in chapter 3 of this thesis, that eligibility is determined by the researchers, the minimum gets the value "C", the category of "Good Enough".

In addition to product-based learning resources of the development of character education is already fit for use, the products are packaged in the form of self-instruction modules so that learners can learn while applying and implementing character education.

Another advantage of the character education based learning resources development results also has tangible benefits, namely the percentage of learners who achieve mastery learning after using character education based learning resources development results, as much as 72.25%.

After the final product shaped module which has been revised by all stages of the trial and fit for use, the product can be disseminated and implemented to the user.Although the module is intended for learners, but it is possible for the teachers or the general public who are interested in mathematics class VIII.

CONCLUSSION

Based on the discussion, and the above description, it can be concluded as follows:he development of character education-based media using the principles of product development from Borg & Gall, which include: the introduction, development, field testing and dissemination.By using the steps in the research and development, program development model of learning and development steps of learning resources, can be produced based learning resources for character education mathematics courses were effective.Based on the results, the results of which are: the preliminary field testing were tested against 3 learners are

included in the category of "Good" with an average score of 3.93.Which consists of the learning aspects of 4.03 with the categories "Good", 3,93 material aspects with the category of "Good", aspects of character education 4, 07 with the categories "Good", and aspects of the media with 3.86 with the category of "Good".On the playing field testing that is tested against 10 learners are included in the category of "Good" with an average score of 4.06, which consists of the learning aspects of 4.08 with the categories "Good", the material aspects of 4.03 with the categories "Good", and aspects of the media with 4.06 with the category of "Good".While on Field Operational Testing tested against 20 learners are included in the category of "Good" this can be seen from the number of students who completed a total of 17 people from 20 learners were tested.And based on the percentage of learners who achieve mastery learning with a minimum value of "70", after using education-based learning resources this character, gained as much as 72.25% and is included in the category of "Good".

The quality of learning resources based on the results of this development of character education, from learning aspect obtained a score of 4.11, including the category of "Good".From the aspect of the material obtained a score of 4.02 is also included in the category of "Good".From the aspect of character education obtain a score of 4.07 which includes both categories.And of aspects of the language obtained a score of 4.02, is also included in the category of "Good".Overall the quality of learning resources is obtaining the category of "Good".

Products based learning resources of the development of character education is effectively used.This is evident from the t test results meanscores of pre-test and post-test that showed that the probability value of 0.000, less than 0.05, so it can be concluded that the averagescores of pre-test and post-test differed significantly.

CULTURE HUMA BETANG (LONG HOUSE) IN CENTRAL KALIMANTAN

Sanasintani

STAKN Central Kalimantan Palangka Raya, Indonesia

Email: ………………

ABSTRACT

Dayak generally adheres to the lineage of his father and mother, ambilinial, with a strong tendency patrinial in marriage. This fact raises a large family (jalahan), with a solidarity which are increasingly widespread. Babuhan (the) refers to the larger family group with an emphasis on the same place of origin. While the term ungkup shows the unity of the tribe, region or religion. Feeling of being at the place of origin is thick so they are not easy to leave the place of origin. The existence of family ties and close personal relationships (loyalty primodial). Untied it's not easy, even less capable family members who are not willing to leave their parents or hometown to speculate or go to school elsewhere. Dayak even today's modern families can not escape from the bonds of kinship. So practically the house is inhabited not only by the father; mothers and their children but Also other family members are far or near. In such an atmosphere to grow homage to the elder family figure. However competition IS ALSO happening in the community.In general, they like to work hard and tenacious. Luxurious style of life is a manifestation of the Aspirations for progress and change.

Keywords: culture, family, betang

Culture Dayak community can be seen from the elements of culture such as religion is a belief or beliefs held as a manifestation of the relationship between the community so intertwined harmonious relationship, kinship system where the family tree becomes very important, because the sense of kinship Dayak so strong that they has a strong unity, livelihood systems they live with farming so that it will naturally form a habit in everyday life. All of which are cultural elements that have a very important role in shaping the character, lifestyle and mindset Dayak all of which are reflected in everyday life. Cultures they have spawned a concept.

The main value that stands out in the life of betang is the value of togetherness (communalism) among the citizens who inhabit it, regardless of the differences they have. From here we learn that the Dayak appreciate the difference, ethnic, religious or social background.

Huma Betang culture is a culture that upholds the value of togetherness, equality, mutual respect, tolerance. A sense of togetherness and brotherhood seems every problem that afflicts one occupant. If one family member who died of the period of mourning absolute enacted for one week for all occupants by not using jewelry, noisy, do not drink wine and turn the electronic equipment is prohibited. The concept of harmony and live together in a house betang and avoid greed culture is essential for the Dayak Culture Dayak community can be seen from the elements of culture such as religion is a belief or beliefs

held as a manifestation of the relationship between the community so intertwined harmonious relationship, kinship system where the family tree becomes very important, because the sense of kinship Dayak so strong that they have a strong unity, livelihood systems they live with farming so that it will naturally form a habit in everyday life. All of which are cultural elements that have a very important role in shaping the character, lifestyle and mindset Dayak all of which are reflected in everyday life. Cultures they have spawned the concept of life.

METHODS

This study begins with a preliminary study on the Dayak to dig up information about the culture of the stem. Data collection techniques used are (1) in-depth interviews means to Obtain Data from informants who have been determined on the activities related to culture betang in Dayak of Central Kalimantan (2) observation role and performed to Obtain data on the implementation of Dayak culture of tradition occupies betang (3) documentation through direct observation.

For that the approach used in this study is a qualitative approach is an approach that requires researchers conducting exploration in whole or focused in getting a clearer understanding and depth of the object studied. A qualitative approach is one approach that is oriented on the symptoms that are normal and natural. Due to such orientation, the naturalistic and the fundamental nature or naturalness nature and can not be done in the laboratory but directly in the field.

DISCUSSION

Culture *Huma Betang* in Central Kalimantan

Culture or a culture derived from Sanskrit that buddhayah, which is the plural of buddhi (the mind or intellect) is defined as matters related to the mind and human reason. In English, the culture called culture, which comes from the Latin word Colere, that processing or working. The word culture is also sometimes translated as "culture" in Indonesian (http:/id.wikipedia.org /w/index.php?title=Budaya&oldid=5401773). Meanwhile, according to Soelaeman (2005) the word "culture" is a development compound from the "cultivation" which means in the form of creativity, initiative and flavor, while culture is the result of creativity, work and intention. In the disciplines of cultural anthropology, culture and the culture it means. Thus the culture is a work of the human way of life that developed and shared by a group of people and passed down from generation to generation. Culture is made up of many complex elements, including religious and political system, customs, languages, tools, clothing, buildings, and works of art. Culture is a holistic lifestyle, culture is complex, abstract, and spacious. Many aspects of culture help determine communicative behavior. Elements of socio-cultural spread and cover many human social activities.

Understanding culture in this paper is associated with the culture of huma betang Central Kalimantan, thereby huma culture betang (longhouse) is defined as the way of life of the Dayak tribe in Huma Betang life can not be separated from values and social norms Therein.

Huma betang in Central Kalimantan

Huma betang (long house) is a traditional house of Central Kalimantan, especially in upstream areas which used to be the center of the Dayak settlement, where the river is a main transportation line Dayak tribes before the road was built as now. Huma great shape and this betang varies in different places. There huma betang which reaches a length of 150 meters and width of 30 meters hinggga. Huma Betang generally built on stilts with a height of 3 to 5 meters from the ground. This long house building height to avoid flooding during the rainy season that threatens the headwaters areas in Kalimantan. Some residential units betang could have more than one depending on the size of the household members of the residential community. Each household or family occupy booth (space) sealed bulkhead of huma betang such large, in addition to the Dayaks have single houses built temporarily to carry out agricultural activities, this is because the farther

the distance between fields with settlements population (Frieda, 2008).

Now huma betang a dwelling Dayaks gradually disappeared in Central Kalimantan. If it can be found occupants are no longer making it the main house, a family shelter, grow a community and share their stories. So huma betang stay be memorable for most Dayaks, but fisolofi huma betang alive and preserved (Frida, 2008).

Cultural Values *Huma Betang* Central Kalimantan

Discussion of the cultural value of an area can not be separated from the system that is rooted in the culture of the area in a culture as well as cultural objects huma betang in Central Kalimantan. Culture system is a set of knowledge that includes a view of life, beliefs, values, norms, the rule of law, belonging to a community through a learning process, which is then referred to organize, assess and interpret a number of objects and events in a variety of aspects of life in society that concerned.

Culture system boundaries of the definition above contains a number of important concepts, such as knowledge, beliefs, values, norms and laws. In the culture system, an element of cultural values seem so important. Cultural value is an abstract concept that is considered good and very valuable in life, which is the highest guidelines for behavior in the life of the community. Various cultural value is then dispersed in a variety of elements such as knowledge, religious, social, artistic and economic.

According to Bachtiar (1987), says there are four kinds of cultural system, namely: (1) a system of ethnic culture, (2) large religious culture system, (3) culture system youngest, (4) the cultural system compound. According to the analysis of Dayak culture system included into the system of ethnic cultures, as passed down from generation to generation. In the system of ethnic culture is known for its value system, that is what needs to be considered by members of ethnic communities which are then expressed in the form of a set of normative systems. Each of these normative systems that specify the expected behavior in people who become members of a particular community in which the normative system was put in place.

More than a building to dwelling Dayak, actually huma betang is the heart of the social fabric of life of the Dayaks. Huma Betang cultural philosophy is nothing other than philosophy and culture that liberate and humanize humans. Betang culture is a reflection of the unity in the daily life of the Dayaks. Betang in every individual's life in the household and society systematically arranged by mutual agreement as outlined in customary law. Mutual security, whether from criminal interference or sharing food, the ups and downs as well as the

mobilization of labor to work the fields. The main value of life that stands in betang is the value of togetherness (communalism) among people who inhabit it, regardless of the differences they have. It is known that the Dayak tribe is a tribe that appreciates differences in ethnicity, religion or social background (http://www.citydirectory.co.id/news/item/rumah-betang-kalimantan-dayak-reflection-of-togetherness)

Culture Dayak community can be seen from the elements of culture such as religion is a belief or beliefs held as a manifestation of the relationship between the community so intertwined harmonious relationship, kinship system where the family tree becomes very important, because the sense of kinship Dayak so strong that they has a strong unity, livelihood systems they live with farming so that it will naturally form a habit in everyday life. All of which are cultural elements that have a very important role in shaping the character, lifestyle and mindset Dayak all of which are reflected in everyday life. Cultures they have spawned the concept of life (http://fazzwordpress.com/2007/05/18/rumah-betang- rumah adat- dan-budaya dayak-yang-hampir-tersingkirkan).

The main value that stands out in the life of betang is the value of togetherness (communalism) among the citizens who inhabit it, regardless of the differences they have. From here we learn that the Dayak appreciate the difference, differences in ethnicity, religion or social background (http://www.sinarharapan.co.id/berita/0506/15/sh12.html).

Huma Betang culture is a culture that upholds the value of togetherness, equality, mutual respect, tolerance. A sense of togetherness and brotherhood seems every problem that afflicts one occupant. If one family member who died of the period of mourning absolute enacted for one week for all occupants by not using jewelry, noisy, do not drink wine and turn the electronic equipment is prohibited. The concept of harmony and live together in a house betang and avoid greed are essential to the culture of the Dayak people, therefore the value is supposed to be maintained and preserved (http://www.sinarharapan.co.id/berita/0506/15/sh 12.html).

Based on the description above, the values contained in the culture huma betang Central Kalimantan include the values of solidarity, equality, mutual respect, tolerance, consensus agreement. While the common law rule established by collective agreement which subsequently held by the head of customs as a social norm in behavior in society.

Characteristics of Ethnic Dayak

Dayak is the collective name of which later formed an ethnic label to the approximately 450 indigenous people who inhabit the island of Borneo. The division is done by some Western anthropologists on the basis of common language, customs laws and rites of death. The term Dayak show certain personal characteristics that are recognized by the people of Borneo that is strong, brave and tenacious. While Measure (1991) see that the equation of physical fundamental of each sub-tribe is the place to stay in the form of long houses, weapons such as chopsticks and saber, patterns and motifs woven and woven, being non-physical such as attitude egalitarianism, democracy, equality between men and women who are the social characteristics of the Dayak community.

Most ethnography about Dayak specifically focusing on long house not only as a form of architecture that is typical, but rather as something that is an embodiment of a structure of social relations typical Dayak. Longhouses began to be seen as the key to understanding the important aspects in the Dayak community through the study of architecture, kinship relationships and social relationships ((Maunati, 2004). So huma betang is a marker that is unique for all Dayak's and functioning as the key to get to know the identity of the Dayak.

Cultural anthropology experts have identified a limiting factor of development, as proposed by Koentjaraningrat (2007) mental attitude as a limiting factor of development, because the mental attitude of the majority of the culture of the tribe or nation (Koentjaraningrat, 2004). A system of cultural values are conceptions of life in the minds of most citizens that culture, about the things that are considered valuable in the life of the nation or tribe. According Bahtiar and Matulada in Mantja (1990) that the cultural value system that acts as a driving and steering behavior of individuals in social activities in the community.

This assessment is necessary, especially in the context of supervision of service activities in Indonesia, which consists of various ethnic groups. Prompts Edwards (1979), Sanders and Wiggins (1985) Don Meyer (1985) and Firstone and Wilson (1985) in Mantja (1990) to take advantage of the study of cultural anthropology in approaching the problems of education, should also be considered and accepted as a donation suggestions positive. The suggestion was not excessive in relation to the statement Bartky in Mantja (1990) which suggests that educational leaders in educational organizations dealing with at least four cultural system, which is the basic culture, the culture of the

school community, organizational culture school staff, and student culture, Therefore educational leaders must also tolerant of various kinds of culture.

Basic Values

What is meant by basic values are the values of a culture that embodies the public's assessment of the nature of life, the nature of the work, perception of time, the view of nature, and the nature of human relationships with others (Monograph Central Kalimantan, 2009: 57; Koentjaraningrat 2004 : 59-78.).

Attitude and outlook on life of the Dayaks is essentially a legacy of their ancestors captivate the generations that. With regard to the view of the essence of life, people generally believe that the next life is better than in the world. Kaharingan religion, which contains elements of animism and dynamism of many of his followers in Central Kalimantan, described hereafter are called Lewu Tatau was as follows: *Lewu tatau habaras boelau* (country rich golden sandy) rundung king habusung diamond (a magnificent stacked diamond) *Lewu tatau je him eccentric bones* (rich country that is not tiring bone). *Lewu king isen kamalu uhat* (magnificent place that is not tiring nerves need not bother).

To achieve a perfect life, a person must do good and fight evil forces that come from power tried to fight the power Ranying Hattala (God). The bad guys or who are affected by the forces of evil always despised and cursed amongst the people. The fight between good and evil is manifest in the people's trust in the white magic and black magic. Parties that disrupt the lives of a group considered to be an evil thing.

Similarly implied above statement that the world is a place to work hard to earn a livelihood. In fact it can be seen that the ethnic Dayak generally resilient and endures through life in the midst of a challenging nature. Uneven population, living in groups of villages that are far apart from one another, stressed the need for courage and tenacity, and fortitude. Nature and the environment should be utilized for survival.

Thus it can be concluded that it is deemed difficult life, but humans must endeavor to live it for the better. This view appears also in the words that often appear when faced with problems and difficulties (puna ampi not hang kalunen tuh / is so alive in this world). It is a fact that they are fighting for life, and almost no view of the world for the afterlife backs.

Their views on the work, is that it works for livelihood, for survival. Therefore, their activities in the field of handicrafts are not only concerned with usability but also the beauty.

This is evidenced by the growth pattern according to the situation. Their view of the time, it can be argued that they are generally more concerned about the present or the present-oriented. Therefore, planning was evident in the preparations and activities to celebrate tiwah (Ngaju) Ijambe (Maanyan), Wara (Lawangan), Dala (Ot Danum). This preparation requires a planning organization that is quite complicated, as it involves a lot of families from different villages will participate. When everything is possible, the process of adjustment and change happens fast enough.

As with other agrarian society, the Dayak people tend to maintain harmony with nature. Equipment life and developing technologies to enable them to utilize everything that is presented by nature. Processing of iron ore to serve a variety of tools such as the saber is a traditional skill. Various means of subsistence (hunting, gathering, fishing, farming, animal husbandry and make tools and handicraft items) that is created and recreated. Shows that the adjustment to nature it is not a passive attitude and static, but rather an active and dynamic. Various potions were discovered and developed traditionally shows that the public is not always accept fate.

Social Relations

Described above have been in basic values, and these values affect social relationships in the community. They know handep a system of mutual cooperation, especially in working the fields and conducting funerals. According Nihin (1991) and Measure (1991) Dayaks have the nature handep (mutual help / mutual help) high, has a primordial loyalty, innocence and respect for others. Handep habits (helping) initially only be made in the fields of agriculture, but over time develop in every field of work. *Handep* activities be maintained and implemented up until now both in the countryside and in the cities. In everyday life they help each other with each other. It is evident that the sowing and harvesting seasons. They work together, as well as in distress to help each other as at the time of death, disaster hit, marriage and other traditional events. So for them there is a proverb that says "*same Babehat metue, same mahian mimbing*" (meaning bear the same weight same lightweight portable). Rights and obligations in this *handep* system: the receiving *handep* (mutual assistance) shall also provide handep if necessary at a later date. It appears that social relationships are basically the same rights and obligations, reciprocal (reciprocal), as shown in handep system of social relations, as well as social control nature.

Dayak like to help others, even though he did not know, because it is no wonder if we visit kepelosok-corners, we were well received and fed according to their circumstances. Meanwhile, according that the Dayak people have an attitude of

life is very simple, monotonous, less creative and do not dare to take the initiative. More waiting, resigned, accepting fate, many succumb, expecting the mercy of others, naive and innocent. Quick satisfied, less or little soul fight or competition. See things straight, regardless of the twists and likunya. Likewise, the results of research Zulkarnean of Dayaks residing in the township of West Kalimantan found that the general character of the Dayaks is a mixture of quiet, honest and innocent, does not talk much and not easily off the promise or conversation (Zulkarnaen, 2000). However, that does not mean people do not have the courage Dayaks against the other party, the Dayak people will be disappointed, angry, vengeful, if repeatedly lied. Fact lately in the form of increasingly often clashes between the Dayaks with migrants who manage development projects or immigrants who work in agriculture and forestry, according to research results Zulkarnean indicate that the Dayaks can be hard if you feel customary constantly harassed, fate sinking, treated unfairly. These conditions foster an attitude increasingly feel the Dayaks sekaum, kinship and foster ethnocentrism (Zulkarnaen, 2000).

The Dayaks are predominantly Kaharingan, but now many are Protestant, Catholic and Islam. It showed Dayak tribes had mingled with the newcomers and the religious life is quite good looks of the church building adjacent to the mosque, and temple. Other means to maintain the balance of social relations is the common law or the law that gives a fine, singer, the guilty parties who have violated customs, or added to the ceremonies of a religious nature. Decisions unwritten law is usually done by damang, or it may be by the head of the village.

The behavior of the individual

Individuals who are accustomed to living in rural communities, or communities of small, scattered and far between, generally does not indicate individualism or selfishness that stands out. The phrase luster oloh kea (like those too) often show attitude komformistis in a sense, in accordance with social norms that apply or demonstrate a willingness of the individual to improve himself so that belonging to a particular society.

Individual behavior that is incompatible with the prevailing mores always denounced and condemned by society, and called him bahadat (not habitual). Rumors about the behavior of a person or a group is often the case even if the act gossip included in behavior that is not good. These rumors also functions as

social control, also simultaneously control the actions of individuals.

Thus an attitude adjustment is not to turn off the initiative, criticism of individual creativity. Individuals who took the initiative, daring for the truth and obtain status and respect creative high enough in the eyes of society. Such an attitude growing by increasing interaction with the modern world and alkuturasi process, due to circumstances which thus provides many opportunities to realize their aspirations for individual and group progress. In the spirit of competition so the atmosphere growing in rural or urban communities. Such circumstances is more prominent in the provincial capital and other capitals in Central Kalimantan where people are no longer large communities are homogeneous (Demographics, 2009: 61).

Another aspect of the group's life in many small communities scattered and distant from one another is the development of competition between groups even this will be able to realize a dynamic society where individualism and the behavior of individuals can flourish with the social order to be achieved together. With the coating system of society, individuality and individual behavior can develop a reasonable expression.

The concept of Time and Rhythm of Life

Harsh natural environment (lifestyle seasonal) may have much effect on the rhythm of life of the Dayaks. Many government officials argued that the Dayaks easily spend the business results of their hard-earned in ceremonies and parties, as if they lived for those days only. On the other hand, they show the attitude impatient, wants to change his life in the shortest possible time.

Not many Dayaks who plunge into traders; merchants of the downstream and upstream rivers in Central Kalimantan mostly people Banjar or China. Likewise in the city showed the same circumstances. They prefer to do a wide variety of agricultural activities, and intellectuals like to become civil servants. This may be due to the high status of civil servants in the public eye, or it may also work it gives a sense of security.

Authority and Leadership

In the history of the Dayak community, the leadership system of the king is not known. That there are chiefs or tamangung-tamanggung which oversees a number of pambakal (village head). Change of leadership is not by bloodline, but based on seniority, experience, courage and wisdom. Tamanggung not a religious prince (Basir) nor the head of customs (damang). He is the leader of his people. He was chosen through consultation elders or community leaders. Here are visible separation between government leaders, religious leaders and traditional leaders (the law). They depend on each other or collateral oriented, but to adhere to the leader or "vertically oriented".

Tamanggung usually once a damang, although not a necessity. Generally, he held the job of a lifetime. At the village level often a pambakal chosen / changed in accordance with the wishes of the people. Who chose *tamangung* is the pambakal. From the picture, it appears that the public is subject to customs or norms in force, but to adhere to the leader chosen by leaders they trust. The values that are visible democratic have long life. Tamanggung a wise, brave and experienced knowledgeable became a byword (basewut = famous) in the region-*tamanggung* other.

In the vast area with a population scattered everywhere there never was a story about Tamanggung charge- *tamanggung* other. Therefore, people are not familiar with a system of nobility, as found in other ethnic groups in Indonesia who have never had a kingdom and empire. They only know sent suspension (higher derivative), sent low (lower derivatives) and sent jipen (derivative slaves / prisoners). These views over the effect on the basic values that are owned by the Dayak community in Central Kalimantan in general.

CONCLUTION

Mentioned above that the Dayak community is open to the outside world: different ideas, people (foreigners) from the outside. They did not a closed society, because it is not oriented to the past. They are more oriented to the present. In a conversation with other people they do not show the attitude of yes or no. This attitude by Western missionaries is an attitude of indecision and inability to make decisions. Dayak people respect and appreciate other people who come from the outside environment. Outsiders are seen as more has the ability. The more so if that person has the advantage of them for example higher education or particular expertise. Although the high trust of outsiders, they demand honesty.

Dayak people always choose a leader of the group based on certain conditions, among other things: experience, performance and seniority appearance in society. Chairmen of village or group serves as a representative of the community in the selection. Initiatives to choose someone, hapakat (consensus) starts from small groups to then proceed, or hapakat with other groups. In the end through the process from the ground that was reached mupakat about a candidate.

Leaders who have been chosen will always ask the opinion of the head of the village or group. Lewu-Bakas Bakas, before taking a decision. Thus the chief and community leaders seemed to serve as a representative body. And on another occasion when asked to consider a case they seemed to perform judicial functions. From the description above it is clear that the Dayak community authority is not absolute, while the nature of their leadership is democratic.

EFECTIVENESS SCAFFOLDING FOR IMPROVING EARLY CHILHOOD LEADERSHIP BEHAVIOR

Sandy Tegariyani Putri Santoso

Universitas Negeri Malang

Email : tegariyanisandy@gmail.com

ABSTRACT

The purpose of this study was to determine the effectiveness of the scaffolding in improving early childhood leadership behavior. Leadership behavior is one aspect of social development that will grow well when stimulated. Scaffolding is one way to provide stimulation to the child that are appropriate to the stages as well as the needs of children. This study is a behavioral research using experimental design with a single subject . The results showed the intervention phase two subjects have a tendency to increase the level and trend. At the time of intervention drawn decrease the level and trend of leadership behavior both subject to decline . It shows that the scaffolding is effective to improve early childhood leadership behavior

Keywords: scaffolding , leadership behavior

Leadership is part of the developmental aspects that will grow well if obtain stimulation and will disappear if it does not receive stimulation. In addition to part of the developmental aspects of leadership is also a requirement. Glasser (1975) revealed that one of the basic human needs is the need for power. Power is meant by Glasser is the power to empower others, the need to achieve success, the need to make a useful contribution, as well as the need to use the abilities and skills possessed. Based on Glasser proposed concluded that every man needs to actualize his power in order to give a contribution to others and the environment.

Everyone has the opportunity to become leaders, ranging from the smallest sphere that is a leader for themselves to a greater scope that the leader of a company or a country. Leaders needed in every social organization, so leadership needs to be stimulated start early, so that the behavior of the leadership into a behavior that has been internalized by the child. Ray (1999) stated that leadership is a set of behaviors that allow the group to complete a common goal. Based on the opinion of Ray can be seen that leadership is a series behavior and not the position of the peaks obtained through the establishment or designation.

Leadership will be realized in the event of social interaction. Leadership is the result of social processes conducted by a group of people. This was revealed by Cox (Heikka, et.al., 2012) stating leadership as a situation when the group members gather and engage with each other. The emphasis from the standpoint Cox is centered on group leadership, leadership is the underlying spirit of teamwork. In the opinion of Cox's leadership is not only the ability possessed by a leader, but a passion for group members to interact cooperate in a team.

At the early age of leadership behavior has begun to emerge, research conducted by Fu (in Shin, et al., 2004) stated that the leadership can arise from an early age. At the time of the child's social interaction will appear, followed by the other children. Further research conducted by Shin (Shin, et al., 2004) show that in early childhood characteristics of a leader's personality is characterized by dynamic, charismatic and a high level of awareness. At the time of the child to interact will appear that gives directives, orders, make requests, many children involved in an activity, encourage cooperation, and obeyed by the other children.

leadership in early childhood is a natural phenomenon and dynamic (Soffler, 2011). on the situation of education can not be determined who the child becomes the leader, but the child will bring his leadership in a dynamic situation. Leadership is the result of social interaction so that in certain circumstances a child can demonstrate leadership behavior, but in other situations the child will become a follower in the group. At an early age that leadership is not the designation of an adult, but it is a natural potential possessed by children who will appear in the child's social interaction.

Hurlock (1997) suggest that in childhood leadership with regard to social acceptance within the group. Leader in

childhood is children who have more ability in a specific field. Leadership in childhood is shown with the Traffic high communication so that children are able to persuade his colleagues to follow his will. Leadership is also demonstrated through the emergence of pro-social behavior, such as helping bring empathy and help friends and sharing.

Social development is the main asset in the development of leadership behavior in early childhood. At the age of 3-6 years are in the child's psychosocial stage of initiative versus guilt (Erikson in Crain, 1992). At this stage the child began to build the initiative in making a plan, set goals, and persistent in achieving it. Children begin to control the environment in play and social interaction. Children who are successful at this stage will feel able to lead the other children, while children who failed to be skeptical of him and the lack of initiative.

Another aspect of the development of leadership behaviors affect the AUD is a skill and proficiency (Fu and Perez in Soffler, 2011). children who have higher language skills would be able to deliver its purpose and be able to influence others to follow his will.

In addition to language skills, cognitive abilities also play a role in bringing about leadership behavior in children. Children who have higher cognitive skills that will come up with creative ideas in play (Shin, et al., 2004) so that the child looks attractive among his friends. But early childhood is still at the stage of egocentric thinking, so that children often impose its will to be followed by others.

At the age of 5-6 years old children have started doing social adjustment. Leadership behavior in children appears as a child's efforts to get the role in the group. Leadership behavior in early childhood is shown by the initiative and sensitivity towards others and the environment. The initiative shown by the emergence of behaviors to invite friends to play, child dared to lead her in the activities, children begin the activity without being asked, the child gives an idea on when playing, the child directs or instructs his friend when playing, children dared to ask teachers and friends, the son answered questions teachers with a clear voice, a child dares to speak in the group. Sensitivity is marked with the child showing his concerns at the time of trouble, children help their friends who have difficulties, children tidy up equipment that has been used.

As part of the developmental aspects of leadership behaviors need to be stimulated. One form of stimulation is to provide assistance or scaffolding so that the ability of children who are still potential in him capable actualized in daily activities. Vygotsky (in Isabella, 2007) is a form of scaffolding timely aid to be withdrawn in time for the learning interaction is happening. Scaffolding comes from within the child when he asked for help, assignment of teachers when providing scaffolding on children is stimulating children to eventually be able to demonstrate leadership behavior.

Research conducted by Sidek (2011) shows that through the provision of scaffolding can improve language skills in early childhood. Scaffolding is given through the questions submitted by researchers to explore ideas and language skills in children. Another study conducted by Shih, et al. (2010) showed that the scaffolding can increase independence and self-confidence in students studying in grade 11 in English. Scaffolding given to research Shih et al. In the form of assistance for student learning and preparation materials for students. Based on research conducted by Shih et. al and Sidek can be concluded that the scaffolding can improve a great aspects of development in early childhood and adult age.

Scaffolding is a strategy of teachers to help children achieve a higher level of perkembanganyang, but rarely used scaffolding at the level of early childhood education. Scaffolding is widely used in high-class to help students who have difficulty in learning. Based on the results of research conducted by Kasmaini (2010) showed that by giving scaffoldding can enhance the activity of students in the classroom. Based on a study of previous research applied the scaffolding to increase leadership behaviors in early childhood.

Scaffolding is one strategy to improve leadership behavior. This is because the scaffolding gives children an opportunity to reach potential levels of development without interference from the teacher. Additionally scaffolding gives children an opportunity to establish a good interaction with peers and teachers, so as to allow the emergence of leadership behavior in children. Scaffolding is used to improve the behavior of the leadership in early childhood is done through seven steps, namely (1) provides maaterial as well as activities that allow children to build social interaction, (2) set the environment and

the atmosphere of the class, (3) provide information about the duties and roles of children in completing the joint activities, (4) provide guidance for children focusing on completing activities, (5) provide words of encouragement, (6) provide examples of leadership behaviors, (7) build leadership behavior.

METHOD

The research design used in this study is to design experiments using a single subject. Single-subject design is used with the aim of researchers the opportunity to reveal more detail the changes generated during the the intervention. In the single-subject study each subject serves as the control itself That seen from the progress of the subject before the intervention, during the intervention and after intervention.Single-subject design used in this research is the design ABAB, which was developed of design AB (Creswell, 2010).

On ABAB design, namely A1 symbolizes baseline conditions before being given the intervention, B1 symbolizes the subject conditions for granting intervention, A2 symbolizes the condition of the subject after the intervention withdrawn, and B2 symbolizes the condition of the subject after the intervention is given back. Baseline both A2 is intended as a control intervention phase, while the second B is the provision of reintervention to see whether changes in the subject's behavior because of the intervention is given not because of other factors, thus allowing it to draw the conclusion that the scaffolding is effective to improve leadership behavior in early childhood.

Subjects in this study were two students in group B of early childhood education Tunas Harapan Srengat District of Blitar. This research subject initials SK and ST, the two subjects were selected based on the observation that the two subjects showed leadership behaviors lowest among his friends.

There are two types of instruments used in this study, the scenario implementation of interventions in the form of daily activity plan with the application of scaffolding and data collection instruments such as observation sheets leadership behaviors early childhood. The instrument used to obtain the data has been through expert judgments of experts and practitioners of early childhood education. Based on the results obtained interrater agreement expert

test index equal to 1 which tells us that the two instruments are valid and fit for use.

Inter observer agrement (IOA) was used to measure the validity of the data results of observation. In the IOA there are three main points to note are (1) the observer should use the measuring system in the same, (2) observers should measure on the subject and kkejadian the same, and (3) observers should be independent (Cooper, Heron, & Heward, 2007). In this study used unscored IOA interval. The validity of data in a single study subject will be visible when the first observer (researcher) and second observer there is suitability. Data to be reliable if at least two observers have a match.

Results of matches considered valid if the acidity between observer to one another observer has an index (r) $\geq$ 70% (Sujiono, 2003). presented below are a random sample of data observations about one subjectthat is ST.

Table 2. Sample Object Observations ST

session	Leadership Behavior	Observer I	Observer II
3	Initiative	3	3
	Awareness	1	1
5	Initiative	20	21
	Awareness	8	7

The result of the measurement similiarity of sessieon 3
1. Initiative   2. Awareness

$$\frac{3}{3} \times 100\% = 100\%$$ $$\frac{1}{1} \times 100\% = 100\%$$

The result of the measurement similiarity of sessieon 3
1. Initiarive   3. Awareness

$$\frac{20}{21} \times 100\% = 95\%$$ $$\frac{7}{8} \times 100\% = 88\%$$

Based on the results of the calculation of the degree of similarity in the session 3 was 100%, and in the session 5 for the behavior of initiatives have in common rate of 95% and sensitivity of 88% so that the behavior observation result declared invalid because of the degree of similarity of more than 70%.

Data analysis techniques used in this study is a visual data analysis of data obtained through observation. The data were analyzed with frequency to visualize the data in graph form in each phase. To examine the visual presentation of the data graph, note the level and trend (inclination direction) (Cooper, et. Al, 2007; Alberto & Troutman, 2009). Level analysis is used to determine how the amount of change of leadership

behaviors that occur, whether stable or varied. Visual analysis of the trends are intended to see changes in the behavior of the phase to the next phase, whether the change is good or bad so that it can be decided the continuation of interventions.

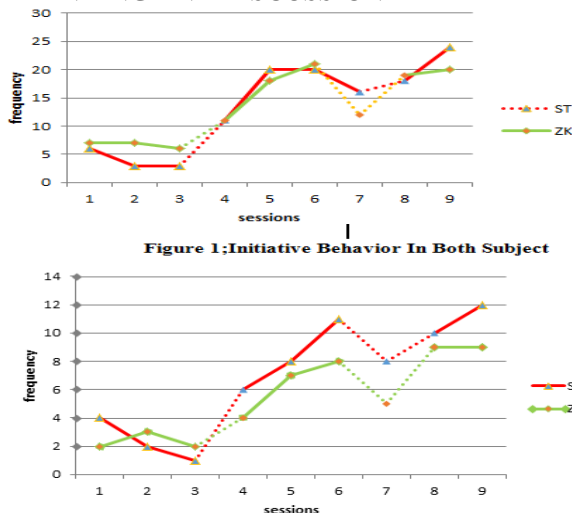
FINDING AND DISCUSSION


Figure 1;Initiative Behavior In Both Subject

Figure 2; Awareness Behavior In Both Subject

Based on the figure 1, during the baseline phase behavior of both subjects to have the initiative tends to be low and tends to decrease at the end of the phase. Entering the first intervention phase two subjects had increased levels, based on existing data trend has increased sharply. During the first phase of the intervention subjects ZK continued to increase until the end of the initial phase, while the subject of ZK in the second and third sessions experiencing latency. This pattern shows the scaffolding giving a direct effect on the behavior of the two subjects have the initiative.

Furthermore, both the subjects returned to the baseline or baseline enters the second (A2), a decline in frequency although not as low on the first baseline. This pattern shows the effect of the change immediately when the intervention is withdrawn. The behavior of both subjects have decreased initiative.

The next session of the intervention given back to the second subject (B2). In this phase, two subjects experienced an increase in behavior, the subject ZK has increased significantly more than the subject ST. ST subjects reached peak levels at the end of the intervention phase, namely the frequency of occurrence of behavior as much as 24 times. The data menunjkkan carry through the provision of scaffolding learning has a positive meaning (+), it has the intention that

the scaffolding is effective to improve the behavior of the initiative subject ST and ZK as part of leadership behavior.

Based on the figure 2, during the baseline phase behavior of both subjects have the sensitivity tends to be low and tends to decrease at the end of the phase. Entering the first intervention phase two subjects had increased levels, based on the data that there is a trend to increase. During the intervention phase of the first two subjects continued to increase from the initial phase to the end phase. This pattern shows the scaffolding giving a direct effect on the conduct has a second sensitivity of the subject.

Furthermore, both the subject returned to the baseline or baseline enters the second (A2), a decline in frequency although not as low on the first baseline. This pattern shows the effect of the change immediately when the intervention is withdrawn. The behavior of both subjects have decreased sensitivity.

The next session of the intervention given back to the second subject (B2). In this phase, two subjects experienced an increase in behavior, the subject of ST increased significantly more than the subject of ZK. ST subjects reached peak levels at the end of the intervention phase, namely the frequency of occurrence of behavior as much as 12 times. The data shows that the provision of scaffolding learning has a positive meaning (+), it has the intention that the scaffolding is effective to improve the awareness of the subject's behavior has ST and ZK as part of leadership behavior.

This study was conducted to two children aged 5-6 years as a research subject. These subject are identified as a child who have a lower leadership behavior at the time to follow the activities in the school. This condition is shown during the learning process of children lack the initiative in activities and lack of empathy. At the age of 5-6 years old children are at the stage of psychosocial initiative versus guilt (erickson in Dworetzky, 1990) at this stage the child began to show initiative in following the activities and it has not been shown by the subject. At the time of the activities in the school follows the second subject can not express their ideas in play as well as directing his friend when playing.

Sensitivity is one form of social adjustment in children so that he received in his group (Beaty in Susanto, 2011; Hurlock, 1997). Subject ST also do not exhibit a sensitivity when it is shown on ST activities

less involved with his friend, if there are friends who have difficulties ST only saw her condition, this makes ST less favored by his friends.

This study uses the provision of scaffolding as a form of intervention. Scaffolding is given as a form of intervention in view of the learning method that matched the levels of early life, by guiding the child slowly and with the child's own effort (Pestalozzi in Susanto, 2011). Interventions performed a total of two sessions for the first session of the intervention carried out during the third session and the second intervention as much as 2 sessions.

In the first intervention first session scaffolding will involve providing activities in groups thus allowing to happen social interaction in children, the first session of the researchers divided the children into three groups, each group consisting of 5 children this is in accordance with what is stated by wood, wood , and Midelton (in Schmitt, 2009) one of the steps in providing scaffolding is providing the materials. Other Scaffolding given to a child is to provide information about the duties and roles of children in completing activities together, in this section researchers raise children's knowledge about how to work together, the rules when doing activities together. Researchers asked children to make an agreement about the rules and ordinances of play, all rules are made based on what was raised children, researchers only reaffirm and clarify the regulations made by the children.

During the activities of researchers involved in play activities and give examples of leadership behavior in children such as offering assistance to children and to show empathy in children such as offering assistance to children and to show empathy in children who have difficulties and trying to stimulate empathy from the subject of ZK and ST. At the end of the session reviewing research about what is being done by children asking the children tell about the feelings and the action it has taken. Researchers also strengthen the leadership behaviors that have emerged during the child's activities give rewards to children who have been led to leadership behavior. In the intervention phase of the first session on the second subject of leadership behavior has started to rise, but researchers noticed that in a group of 5 children less effective because leadership is still dominated by the behavior of children

that previously had had a high leadership behavior.

In the second session and subsequent researchers minimize the number of groups to 3 children per group. With the change in the group scaffolding becomes more effective as evidenced by the increasing leadership behavior on both the subject indicated by the change in the level in the early phase of the baseline of the first leadership behavior subject is at a low level until the intervention both leadership behavior are at a higher level, an increase level followed by a change in trend is increasing.

Leadership behavior in early childhood is closely associated with social behavior of children (Beaty in Susanto, 2011). Children can bring leadership behavior when the child in social situations, the activities provided for children allows children to interact with other children. Children who do not bring leadership behavior is a child who has not had the opportunity as well as stimulation to bring his leadership behavior. Scaffolding is one way that teachers do to encourage children to be able to bring leadership behavior at school activities.

In the intervention phase subject ZK began to invite friends to play, for example, called his friend to move to sit in a group, bold storytelling within the group, though still in small groups, dared to ask the teacher if experiencing difficulties, it is in line with research conducted by Sidek (2011) showed that administration of scaffolding can improve language skills in early childhood. Subject ZK in the intervention phase was also able to give an idea on when playing, as well as the start of the activity without being asked in line with research conducted by Shih, et al. (2010) which shows that through the provision of scaffolding can increase self-reliance and self-confidence in children.

In both types of leadership behaviors that have the initiative and awareness subject ST increase is more significant. In the intervention phase ST more courage to ask the teacher as well as answering questions given by teachers with a clear voice, in contrast with that of the previous phase when given questions ST more silent and looked down, when all the activities that can not be done by subject ST he saw his neighbor without wanting to ask questions or ask for help first. This causes the subject ST less attention from his Shin, et al. (2004) stated that the leaders in early childhood is a child who is able to build relationships

(relationship) with the teacher. In the intervention phase subject teachers provide scaffolding to ST by delivering a completed activity in groups so that the subject ST had a chance to ask questions and give direction to her than that ST also has the opportunity to further interact with the teacher (researcher).

CONCLUSION

Based on the results of visual analysis can be concluded that the change from baseline of the first phase to the second phase of the intervention that changes the level of the increase and this was followed by a trend that is moving up. Changes in the level and direction of the trend is moving up showed that the scaffolding is effective to improve early childhood leadership behavior.

QUALITY CONTROL AND ANSSURANCE FOR 5 PILLAR ROAD SAFETY STUDIES IN STATE POLYTECHNIC OF ROAD SAFETY TEGAL

Saroso; Mukhadis; Tuwoso; Hary Suswanto

Doctored Student, State University of Malang

Email: ………..

ABSTRACT

This research work has empirically investigated Quality Control and Insurance (QCA) in 5 Pillars Road Safety Studies in State Polytechnics Road Safety (SPRS), Tegal, Indonesia. 5 Pillars Road Safety Studies was seen as a timely intervention in our educational sector and as such it was introduced in 2006 in our tertiary institution in order to reduce the level of fatal accidance caused by land transport in the country. A conceptual framework was developed by the authors to illustrate QCA in 5 Pillars Road Safety Studies. Three (3) research questions were raised to guide the study and two (2) corresponding hypotheses were formulated. The case study research design was adopted in the study. A sample of one hundred (100) students offering 5 Pillars Road Safety Studies (year two) from the five schools in the college were used for the study. The multi-stage sampling technique was adopted in drawing up the sample. Questionnaire was used in eliciting information from the respondents and it was titled "Quality Control and Insurance in 5 Pillars Road Safety Studies' Questionnaire (QCIPRSSQ)". It was designed in a 4-point rating and it was in two (2) sections. Section A was on the demographic variables while Section B contained ten (10) opinion statements. The instrument was validated by experts and the test re-test method of reliability was used in obtaining a coefficient of 0.82. The data collated was analyzed using Mean, Standard Deviation, t-test and Analysis of Variance (ANOVA). One of the findings is that there is a significant difference between the perceptions of male and female students as regards factors affecting QCA in 5 Pillars Road Safety Studies in State Polytechnics Road Safety, Tegal, Indonesia. A major recommendation advanced was that there should be proper and regular accreditation exercise void of „sharp practices".

Keywords: *5 pillars road safety studies, quality control and insurance, sprs , tegal, pekalongan, cirebon city*

The recent call for the inclusion of transport safety education/studies in tertiary Educational institutions in Pekalongan tegal cirebon is an indication of its importance to employment creation, as Pekalongan tegal cirebon continues to churn out graduates that are hardly self reliant but solely dependent on white collar jobs for sustenance[1] The 2010 Global Monitoring Report (GMR) of the United Nations Education, Scientific and Cultural Organization (UNESCO), revealed that about 92 per cent of Pekalongan tegal cirebon n population survive on less than 2 dollar daily, while about 71 per cent survive on less than 1 dollar daily – a condition many have described as inexcusable, judging from the abundant natural deposits and high human population estimated at about 167 million people (2011). Imeokparia and Ediagbonya (2010) stated that the high level of poverty vis a vis the resources available in Pekalongan tegal cirebon is highly unacceptable, thus the urgent need for government and individuals to create more job opportunities for the teaming youths.

The essence of transport safety studies is to build in the students transport safety spirit and culture[2]. Transport safety studies have emphasis on "education for self-employment" rather than "education for paid employment".

This kind of education has become so important in Pekalongan tegal cirebon owing to the high level of fatal accidance caused by land transport coupled with its accompanying social vices and unrest. It is believed that this kind of education is capable of meaningfully engaging the individuals and making them more productive and useful to themselves and the country at large.

The international road assesment Programme (iRAP) gave adequate recognition to the link between education and transport safety. In the FEAP blueprint issued in January 1997, emphasis was given to transport safety training and it made its recommendation on page 16, item 32 as: Transport safety development will also be included in the curricula of primary, secondary, technical schools and universities to ensure that the transport safety culture is inculcated in graduates who will ultimately be job creators and not job seekers. Transport Safety Minister of Education in August 1988 and Transport Safety Association of Polytechnic in Asia in 1991 opined that students in tertiary institutions should be taught transport safety education in their final sessions[3].

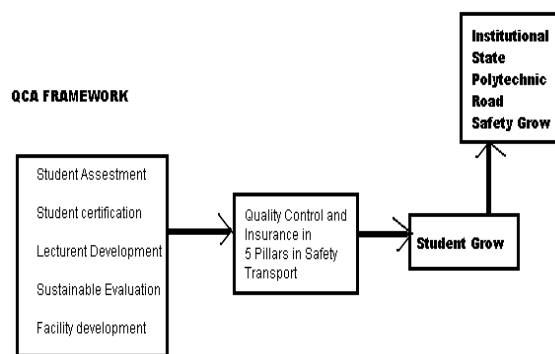
The Federal Government in 2006 set up transport safety studies and made it compulsory for students of higher education institutions irrespective of area of specialization and in most universities, polytechnics, and colleges, transport

safety studies have been adopted as a compulsory general studies course for students. 'The overall objective is to continuously foster transport safety culture amongst students and faculty with a view to educating them as well as supporting graduates of the system towards establishing and also maintaining sustainable business ventures. The Minister of education stressed that the NUC was given presidential directives by the Ministry of Education to supervise and coordinate the programme of introducing transport safety education/studies in Pekalongan tegal cirebon n institutions of higher learning in collaboration with all regulatory bodies of higher institutions - the National Board for Technical Education (NBTE), National Commission for Colleges of Education (NCCE) to be handled by the committee set up by the Federal Government[7]

The goals of this programme are no doubt a laudable one but for it to be achieved; there is need for all the relevant authorities to ensure that acceptable standard is maintained[4] The concept of Quality Control and Insurance is relatively new in this field owing to the fact that the programme is still very new in our Colleges of Education. Quality Control and Insurance (QCA) is defined as the systematic review of the educational programme to ensure that acceptable standards of education, scholarship and infrastructure are being maintained[5] It was identified three approaches to Quality Control and Insurance and they are: accreditation, assessment and audit[6]. The author stressed further that accreditation involves the evaluation of whether an institution or programme meets a threshold standard and qualifies for a certain status. Assessment involves the evaluation that makes graded judgments about quality, in this respect it goes beyond accreditation that makes a binary judgment while a quality audit checks the extent to which the institution is achieving its own explicit or implicit objectives.

Figure 1 : Framework QCA State Polytechnic Road Safety Tegal

The above model explicitly shows the relationship among various variables associated with Quality Control and Insurance in 5 Pillars Road Safety Studies in Colleges of Education. In the model above, three (3) facets are of importance to us. That is, the factors affecting Quality Control and Insurance (QCA), three (3) outcomes illustrated by individual growth, institutional and national growth. Some factors have been identified as influencing the quality of 5 Pillars Road Safety Studies and it is believed that once these factors/standards are properly maintained, there will be an overall growth both in the institutions (that is, Universities, Polytechnics and Colleges of Education) and individuals (students and teachers/lecturers/instructors) and of course there will equally be national growth because of the high national standard that will be in place. The institutional growth can take the form of greater recognition of the institution both within and outside the shores of the country. As for the case of individual growth, it can take the form of churning out graduates capable of exercising high level of productivity and able to compete favourably with their counterparts of similar status or academic level both within and outside the country. With sound Quality Control and Insurance in place, instructors, teachers and lecturers are able to upgrade and become more effective and efficient in the discharge of their duties. The overall outcome of QCA is National growth there by leading to national recognition and greater reputation of the country as regards the educational sector.

The 5 Pillars Road Safety Studies as an intervention programme which was introduced in tertiary institutions in Pekalongan tegal cirebon as compulsory course (that is, Colleges of Education, Polytechnics and Universities) in 2006 was met to meet the Socio-Economic needs of the country. With the introduction of this programme in Colleges of Education, the National Commission for Colleges of Education (NCCE) was given the mandate to ensure quality and standard of the programme. For the programme to achieve its goals and objectives, all stakeholders must be abreast with the factors that are capable of affecting the quality of the delivery of the programme and its implementation. Since the implementation of the programme is relatively new in most of the Colleges of Education, complying with Quality Control and Insurance as regards the programme may be a major challenge. Are there adequate facilities, Transport safety centres and quality teachers/lecturers on ground to guarantee Quality Control and Insurance in these colleges? Are the stakeholders aware of the factors that are capable of affecting Quality Control and Insurance in 5 Pillars Road Safety Studies and are they conscious of maintaining the standard and quality of delivery as


stipulated in the Benchmarks? It is on the basis of the above, that the researchers intend to empirically investigate QCA in 5 Pillars Road Safety studies in Colleges of Education in INA State.

The main purpose of this study is to ascertain the place of QCA in 5 Pillars Road Safety studies in Colleges of Education while the specific purposes include:

1. To find out the factors affecting Quality Control and Insurance (QCA) in 5 Pillars Road Safety studies in Colleges of Education;
2. To find out if there is a significant difference between the perceptions of male and female students as regards factors affecting QCA in 5 Pillars Road Safety studies
3. To find out if there is a significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Sciences.

The following questions were raised by the researchers to guide the study:

1. What are the factors affecting Quality Control and Insurance (QCA) in 5 Pillars Road Safety studies in Colleges of Education?
2. Is there a significant difference between the perceptions of male and female students as regards factors affecting QCA in 5 Pillars Road Safety studies?
3. Is there a significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Sciences?

The following hypotheses were formulated to guide the study:

Ho1: There is no significant difference between the perceptions of male and female students as regards factors affecting Quality Control and Insurance in 5 Pillars Road Safety studies.

Ho2: There is no significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Sciences.

The findings of this research work are of great importance to all stakeholders in the field of 5 Pillars Road Safety studies. The findings will help the Government in obtaining firsthand information as regards QCA in 5 Pillars Road Safety studies in Colleges of Education. This will go a long way in assisting the Government in the formulation of necessary policies to improve and maintain the standard of the programme. Teachers/lecturers especially 5 Pillars Road Safety Educators will also find this study useful as it will furnish them with up to date information as regards QCA in 5 Pillars Road Safety Studies. Students, Entrepreneurs and members of the general public will equally find this study useful in bringing about enlightenment.

Scope of the Study

The geographical scope of the study covers the State Polytechnics Road Safety, Tegal, Indonesia in Edo State while the content scope covers the following variables: Quality Control and Insurance, 5 Pillars Road Safety Educators/ Lecturers, Students and Sex.

METHODS

This section deals with the modalities, ways and media explored by the researchers in the course of the investigation and they are discussed below:

Design of the Study: The survey research design was adopted for this study. This design was adopted because the researchers were interested in the accurate assessment of the characteristics of the whole population through the selection of sample considered to be representative of the population

Population: The population for this study is 1200 year two students currently offering 5 Pillars Road Safety Studies as compulsory course in State Polytechnics Road Safety, Tegal, Indonesia.

Sample and Sampling Technique: The sample size for this study is 100. The multi-stage sampling technique was used in drawing up the sample from the five schools in State Polytechnics Road Safety, Tegal, Indonesia. That is, School of Language, School of Art and Social Sciences,School of Sciences, School of Education and School of Vocational Education. In adopting the multi-stage sampling, the simple random sampling was first adopted in selecting two schools (school of vocational education and school of sciences) from the college thereby giving each schools equal opportunity of being selected for the study.The systematic sampling was there after used in obtaining a sample size of (50) from the twos chools each.

Research Instrument: The questionnaire was designed in eliciting data from the respondents. It was titled "Quality Control and Insurance in 5 Pillars Road Safety Studies' Questionnaire (QCIPRSSQ)". It was divided into two sections (A and B). Section A comprises of demographic variables while section B comprises of opinion statements structured in 4-point rating. That is, Strongly Agree (SA), Agree (A), Disagree (D) and Strongly Disagree (SD)

The instrument was given to two (2) experts in 5 Pillars Road Safety Studies and one expert in

measurement and evaluation and they made necessary inputs to the instrument.

The test – retest method of reliability was adopted. The instrument was initially administered to 20 students of 5 Pillars Road Safety Studies which was not actually part of the sample. It was later re-administered to them after an interval of two (2) weeks. Their responses were correlated using Pearson (r) and the reliability coefficient obtained was 0.82.

Data Analyses: The Statistical Packages for Social Sciences (SPSS) version 16.0 was used in analyzing the data. The descriptive statistics used include mean and standard deviation. The mean value of 2.50 was used in taking decision. A mean value of 2.50 and above was considered as Agree while a mean value of less than 2.50 was considered as Disagree. The inferential statistics used was the student t - test of independent samples and the Analysis of Variance (ANOVA).

RESULTS AND DISCUSSION
Results

This section is designed to present the data collated for ease of analysis and interpretation.

Research Question 1: What are the factors affecting Quality Control and Insurance (QCA) in 5 Pillars Road Safety studies in Colleges of Education?

The table 1 shows that the highest mean score was recorded in item six (6) while the least mean score was recorded in item eleven (11). The mean score for all the items are above 2.50 and as such, all the factors are accepted. The aggregate mean score is 3.39 which mean that all the factors affect Quality Control and Insurance.

Hypotheses Testing

Ho1: There is no significant difference between the perceptions of male and female students as regards factors affecting Quality Control and Insurance in 5 Pillar Road Safety studies.

Table 2: Examination of the perceptions of male and female students as regards factors affecting QCA in 5 Pillar Road Safety studies

Variable	N	Mean	STD	Df	Sg (2 Tailed)	Decision
1	15	147,34	5,8			Significant accepted
2	15	192,7	7,4	19	0	

Table 1: Mean and Standard Deviation of Factors Affecting QCA in 5 Pillar Road Safety Studies

S/N	Factors Affecting Quality Control and Insurance	Mean	S.D	Decision
6	The absence of regular and proper Accreditation exercise affects Quality Control and Insurance.	3,66	0,47	Accepted
7	The absence of regular and proper Assessment exercise affects Quality Control and Insurance.	3,32	0,47	Accepted
8	The absence of regular and proper Auditing exercise affects Quality Control and Insurance.	3,34	0,48	Accepted
9	The absence of regular and proper Supervision of institutions affects Quality Control and Insurance.	3,28	0,50	Accepted
10	The absence of regular and proper Supervision of academic programmes affects Quality Control and Insurance.	3,33	0,54	Accepted
11	The absence of regular and proper monitoring activities affects Quality Control and Insurance.	3,36	0,63	Accepted
12	The absence of required teaching qualifications affects Quality Control and Insurance	3,29	0,68	Accepted
13	The absence of required teaching experiences affects Quality Control and Insurance	3,33	0,76	Accepted
14	The absence of required professional qualifications affects Quality Control and Insurance.	3,28	0,89	Accepted
15	The absence of teaching aids and infrastructure affects Quality Control and Insurance	3,31	0,86	Accepted
	Aggregate	3,86	0,56	

The table 2 reveals that the calculated probability is 0.000. Since the calculated probability is less than 0.01, the null hypotheses (Ho) is therefore rejected which means that there is a significant difference between the perceptions of male and female students as regards factors affecting QCA in 5 Pillar Road Safety studies.

Ho2: There is no significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Sciences

Table 3: Examination of the Perceptions of students from various schools

	Sum of Squares	Df	Mean Square	F	Sig (P)	Decision
Between Groups	505,1	3	168,3			
Within Groups	689,7	35	19,7	8,7	0	Significant accepted
Total	1194,8	38				

The above table reveals that the calculated probability is 0.000. Since the Calculated probability is less than 0.01 levels of significant, the null hypothesis (Ho2) is therefore rejected which means that there is significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Sciences

Discussion

The analysis of research question one reveals that there are fifteen (15) factors that are capable of affecting Quality Control and Insurance in the field of 5 Pillars Road Safety Studies. This finding to a large extent is in support of Amoor (2010) where the author stressed that the following factors affect quality in Business education which is having positive correlation with 5 Pillars Road Safety Studies: shortage of teachers, teachers" qualification and experience and lack of supervision of teachers.

The analysis of the hypothesis one reveals that there is a significant difference in the perceptions of males and females as regards factors affecting Quality Control and Insurance in 5 Pillars Road Safety Studies. The variation in their perceptions is emphasizing the importance of gender (sex) in educational research and in 5 Pillars Road Safety Studies in particular. The analysis of the hypothesis two reveals that there is a significant difference among the perceptions of students in School of Vocational Education, School of Languages, School of Sciences and School of Arts and Social Science as regards factors affecting Quality Control and Insurance in 5 Pillars Road Safety Studies.

CONCLUSION

This research work has been able to critically examine the place of Quality Control and Insurance in 5 Pillars Road Safety Studies which is relatively new in our educational landscape. Based on the analyses of the research question and hypotheses, it can be concluded that there are so many factors affecting QCA in 5 Pillars Road Safety Studies.

Since these factors are known now, it is therefore imperative for all stakeholders not to relent in their efforts.

EFFECT OF TECHNOLOGICAL DEVELOPMENTS ON ECONOMIC ACHIEVEMENT IN JUNIOR HIGH SCHOOL CRISTAL DILI

Sebastião Pereira; Francisco Mariano Hornay; Agostinho dos Santos Gonçalves; Ilidio Ximenes Moreira

Department of Sociology, Faculty of Education, Instituto Superior Cristal
E-mail: sebastiao.cristal@yahoo.co.id

ABSTRACT

In the world of education, development of technology is necessary to support and to accelerate the desire of an individual in order to carry out their daily activities effective and efficiently, both as a medium of instruction and as media teaching to help students to access information or particular theory as desired. Technology is instrument to help a particular individual is the internet, because the internet both teacher and student can search for the desired material to be used as a reference for teaching. While the students use to search for material in order to improve their learning achievement and to acquire a good knowledge and obtain high scores. The learning achievement is the results achieved by students after participating in learning activities. A person is considered outstanding, if he has won something a result of what it earned, either as a result of learning, work, or practice skills in a particular field. In this study the authors give a questioner to students that include about technological developments in this case the Internet and student achievement. Based on the results of the analysis show that there is a significant relationship between the use of technology on student achievement in In junior Cristal Academic Year 2015, in which the correlation coefficient (R) is equal to 0.698 were classified as strong and the value of t = 6.954> table = 1.6751 with a significant level 0000, then the alternative hypothesis (Ha) is accepted and reject the null hypothesis (H0). For simple linear regression equation Y = 10.680 + 0.708X. Meanwhile, result of the coefficient of determination (R2) equal or 0.487 or 48.3%, which meant that 48.3% of student achievement is influenced by the use of technology in junior Cristal Dili.

Keywords: Development, Technology, Internet, Learning Achievement

Education is the most fundamental requirement for a state, because the success of the development of a nation is determined by the presence of qualified human resources, which is produced through a quality education. School is a place of education, including the organization of learning activities carried out in the classroom. Everyone has and Master of Science and can teach it to others. Teaching conducted in accordance with his ability to use the appropriate procedure. According to Robinson (in Kadir, et al., 2012: 247) argues that the quality of education is the output or result of the institution.

By the advancement of science and technology is more advanced has affected various sectors of life, including the education sector. In East Timor, education has undergone many changes in the last 12 years. One of the changes is the use of technology as a medium that is increasingly prevalent in the world of education such as the use of the internet, mobile phones and games. This component is the most important medium for all people, especially the students, even the education sector that previously were done in traditional sort gradually replaced with multimedia tools.

Internet (abbreviation of interconnected-networking) is a series of computers connected in a series. Meanwhile, the network itself is defined as a system of communication of data between computers. How to connect the circuit with norm is called internetworking. Internet has a global reach so that can connect thousands or even millions of computers with this diverse payloads ranging from education, government, business, culture, economics, politics, and technology. The Internet is today's technology that has a very important role in the globalization era. Internet world is like a library that we can access easily all the needs that we need. Internet has a global data network; one can access the internet freely in accordance with his will. Internet network allows individuals to interact and communicate with others from around the world at a cost that is affordable enough. Thus, teachers and students can use that DAPT access the material so that it can improve student achievement.

According Tita (2012) that among all these, email/electronic mail and the World Wide Web is more often used and many other services are built upon them, such as mailing lists (Mailing List) and Weblog. The Internet allows the current service (Real-time service), such as web radio, and webcasts that can be accessed around the world. In addition, through the Internet it is possible to communicate directly between two or more users through instant messenger programs like Camfrog, Pidgin (Gaim), Trilian, Kopete, Yahoo! Messenger, MSN Messenger and Windows Live Messenger.

The learning achievement can be interpreted as a change in behaviour in students that occur after

holding the learning process or after the student's learning. Formal educational institutions is not an absolute guarantee to print human achievement, this depends on factors that affect the learning process. The function of providing education is not entirely possible and indeed also not left entirely to the institution because the learning experience, it basically can be obtained throughout the human life anytime and anywhere, including in the society and their own families.

People say that the Internet is a new world that includes covers ranging from the world economy, politics, education, and others. Particularly in the world of internet education gives an access to data that can facilitate the learning process. Use of the Internet encourages collaborative learning among students or classes from school to other schools by pushing the boundaries of space and time, (Graus, 1999; Choi and Nesi, 1999; Stepp-Greany, 2002; Noni, 2004).

Based on the description above, at this moment I wish describes the influence of the Internet technology against student achievement, this is based on the number of internet use among students. Internet technology is very useful for junior high school students in Cristal because by the Internet technology is that students can help students to access the material. In East Timor, held use of free internet (wifi) in some institution and some public place can be reached by many people, but its capacity is very limits so that the process is slow. Agencies conducting free Internet usage only on institution Are Some, like words office, and public places such as parks recreation are in Dili that Largo de Lecidere and garden 5 de Maio which will give an opportunity to the students to access the material.

However, these places are very crowded students whom have difficult to find a place to access the internet. To that end, the Institute of Education Foundation Cristal cooperate with government institutions engaged in technology to install a free internet networks on campus and the school to be accessible for teachers and students. Based on the results of observations show that the free time or break time students bring their laptops and mobile phones to access the material and the assignment of teachers.

RESEARCH METHODOLOGY

This research has been carried out on a second grade student, junior high schools, which are located Jalan Balide Dili, Timor Leste. This research has been conducted for two

(2) weeks. The population in this study were all the students of the second grade subject Natural Science as sample in this study were 53. In this study consisted of variables (technology development) with dependent variable (Y) in this study is student achievement. Data collection techniques in this study is a technique Questionnaires, which is a method to gather the data, where the data source (the respondent), will provide data by providing a list of questionnaires to be filled by respondents, so the results of this is the data that will processed and analysed. In this research, data analysis techniques used by researchers is the Pearson Product Moment Correlation to determine the correlation coefficient between the variable X to Y by the following formula:

$$r = \frac{n \sum XY - \sum X \sum Y}{\sqrt{(n \sum X^2 - (\sum X)^2)(n \sum Y^2 - (\sum Y)^2)}}$$

Significant Test of functioning if researchers want to find the meaning of technological developments variable relationship to variable student achievement, the result of Pearson Product Moment Correlation was tested with the following formula:

$$t\ hitung = \frac{r\sqrt{n-2}}{\sqrt{n-r^2}}$$

According Riduwan (2010; 136-137) states that the distribution (ttabel) for = 0.05 and degrees of freedom (df = n -2) decision rule: if count> t table means significantly reverse t count <t table means insignificant. To analyse the data obtained in this study made calculations helper table statistics. Technological developments on student achievement regression equation is simple, namely: Y=a+bX. Furthermore, to declare the size of the variable contribution of technology to the development of variable student achievement can be determined by the formula determinant coefficient is KP = r2 x 100%.

RESULTS AND DISCUSSION

In the study the correlation coefficient (R) is used to determine the relationship between the independent variables (technology development) and dependent variable (student achievement). Result of research shown that the correlation coefficient can be seen in the following table:

Correlations

		learning achievement	Technolgical development
Pearson Correlation	learning achievement	1.000	.698
	Technology development	.698	1.000
Sig. (1-tailed)	learning achievement		.000
	technology development	.000	
N	learning achievement	53	53
	technology development	53	53

The table above shows that the relationship between technological development with student achievement at 0.698 by the strong category. To find the significant effects of the to technological development on learning achievement of the junior high student in Cristal academic year 2015. Result of the t-test by comparing with probability t count level of significance (0.05). Can clearly be seen in the table below:

Coefficient

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	10.680	2.932		3.643	.001
	technology development	.708	.102	.698	6.954	.000

a. Dependent Variable: learning achievement

Based on the above analysis, shows that the simple linear regression line then for the simple linear regression line on the chart Coefficients can be said that: Y = 10.680 + 0.708X. Interpretation of the coefficient of the regression line shows that if student achievement constant variable that is equal to 10,680. If the technology development improved of the unit, then the student achievement can have a positive impact are 0.708.

Based on the obtained value of calculation SPSS. 20 t count 6954 > of t table are 1.6751 on the degree of freedom df = n-k-l = 51 on the assurance level of 95% or 5% error rate. The calculations show null hypothesis (H0) is rejected and the alternative hypothesis (Ha) is accepted. Ha receipt means that technological developments have a significant effect on student achievement of junior high school student in Cristal at 2015 school year. For the analysis of the contribution of the influence of technology on student achievement can be seen in the following table:

Model Summaryb

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.698a	.487	.477	3.385	.487	48.351	1	51	.000

a. Predictors: (Constant), technology development
b. Dependent Variable: learning achievement

From the table above, the value of the coefficient of determination (R2) are 0.487 or 487% meant that 48.7% of technological development determines the rise and fall on student achievement Economic Accounting.

Discussion

Based on the results of the study on second grade of junior high school student were giving questioners to the 53 respondents. Results of research and analysis of each item by using the Windows program SPSS version 22.0 indicates that the value of the coefficient corelation of 0698 with strong category. For the t test (t-test) showed that technologyy

development has a significant influence on student achievement in grades t coung 6954> of t table of 1.6751 at the level of error (5%). T test results can be seen t count greater than t table or t count (6954) > t table (1.6751), then the alternative hypothesis (Ha) is accepted and rejected null hypothesis (H0), meaning that there is a significant influence on the development of technology in this case the Internet on student achievement in the junior class II Cristal 2015. Thus, it can be explained that learning achievement is the results that have been achieved by students after participating in learning activities of teachers and other business students can do to improve on the things he had learned so indicated with test scores or number of test or evaluation by teachers. The results showed that in order to improve student achievement need their advice such as the availability of free internet support for students to be able to access the necessary materials, so that the material that was difficult and that is not taught teachers can be accessed by students via the internet. It is seen from the calculations that give contributions of $ 0.487 or 48.7%.

Thus, the Internet is important in education, especially to improve student achievement. Apart from being a medium of education, the Internet is also useful as a medium for sharing among students that could ultimately make students know the quality of herself to others. A student who is not able to do a good time sharing can lead to negligence in carrying out the duties of a student is learning. Not all the information available on the Internet provides information that is positive, but also there is information that is negative. According to John Cradler in his book Learning & Leading with Technology (1999) that students who use the Internet have the ability to apply the skills well in real situations, organize and recognize ability interest in a certain field. Therefore, the Internet as an information source can produce a very good job, and learning via the Internet can increase the level of knowledge of such students, a presentation of their duties with excellent presentation and describe things clearly can infer from a variety of sources and views, and can complete a task very good.

Conclusion

Based on the analysis results and the above discussion, the writer can draw the general conclusion that there is a significant effect of technological development on student achievement in the junior class II Cristal academic year 2015. In particular, there is a significant influence because the value t count 6954> t table at 1.6751 to the significant value of 0.000, then Ha, H0 accepted and rejected. For simple linear regression equation Y = 10.680 + 0.708X. For the correlation

coefficient is equal to 0.698 and the coefficient of determination (R2) of 0.487 or 48.7 which meant that 48.7% Cristal junior high student achievement is affected by technological developments. Thus, it is expected that the school in order to supervise and control the existing facilities, especially the Internet so that students can access the interest easily in order to increase knowledge (knowledge) both correlation with a lesson or to add to their knowledge. In addition, to maintain and improve the credibility of education institutions, especially junior Cristal need for good surveillance system technology so that the students / i only access the material and is affected by things that are negative on the use of the internet.

ABSTRACT

The school principals are an important agent within school daily life. As person in charge in an educational process, they should take care about their students improvement. The students must reach their optimum potentiality on personal ability, religious attitudes, values practised, self control and self esteem, personality, cleverness, social sensitivity, and life skill in order that they can make contribution to the society. Concerning the matter, education based on prophetical values gives a holistic atmosphere to fulfill the idea of educating young generation. This research employs qualitative method with case study perspective. The research describe focuses:(1) the prophetical values in school daily life, (2) the strategies of the school principal in order to accommodate prophetical values, (3) prophetical values that the school principal works for it in stakeholders lifes, and (4) prophetical values that the school principal shows. Informants are the principals of SD YIMI Fullday SchoolGresik, SDK Santa Maria II Malang, SD Metta School Surabaya. Individual data of SD YIMI Fullday School Gresik describe prophetic leadership as a dynamic activity through learning process in school daily life that harmonize between intellectual tradition and spiritual consciousness.Individual data of SDK Santa Maria II Malang describe prophetic leadership as a process of empowerment based on human good nature. Individual data of SD Metta School Surabaya describe prophetic leadership as a dynamic process that encourages human being precious life to reach its fullness.Based on multy-case data, the research come to four conclusions:(1) school principals employs personal and functional approach for conservating prophetic values in school daily life, (2) schools principals make a meaningful activities for accomodating prophetic values within schooldays, (3) school principals empower values, and (4) stake holders say that school principals influence their daily life. As the conclusion, prophetic leadership is a capacity to enactment the prophetical values.

Key words:leadership model, school principal, prophetic leadership

The school principal, as an agent of change, should retain the basic values of institutions. The basic values are the crystallization of sublime experience that contains an inspirational and normative values by which one will always keen-motivated to make it happen. The basic values that can be sourced from philosophical beliefs, socio-cultural, political, economic, or religious.

Based on the basic values that bring the citizen school principals to change. If a change in the surrounding incompatible with the basic values, the principal is obliged to affirm the basic values that must be followed by the school community and stakeholder education. Tobroni (in Arifin, 2014:7) confirmed that the leadership based on values is a realization of the 21st century is called the century of the values or the values age. The ugliness of the times that appear in the present is seen as a result of the crisis of values (Arifin, 2014:8).

The context of the discussion of "leadership that based on values' introduced a new genre of leadership, namely the prophetic leadership (Hadi, 2012:xv). This model states that exemplary behavior in the form of prophetic wisdom, messages and life have contextual dimension that continually missed his presence when the human condition that is not able to demonstrate clearly the basic values that deserve to be followed.

Religious-based educational institutions inculcate religious values to all citizens.They have an awareness in carrying out religious values. Religious-based educational institutions put religious values into practice in daily lives in order to contribute positively to the environment. There was a process of transformation of religious values into the values of life that is manifested in the lives of students. On the basis of this understanding, the system of educational institutions based on religion is a planned effort to make the students familiar, caring, and internalize religious values and practice them in daily life in the community.

Religious-based educational institutions is already offering an environment that conditioned the birth of mainstream values based on religious principles derived from the prophets. In line with this concept, religious-based educational institutions believe that someone would have to walk and live by understanding and believing the main principles to live as a noble creature. Within this context, the researcher saw that literature that answers the question "How does the principal show the prophetic leadership?" is still limited. On the basis of this reality, researcher considers that theme

of prophetic leadership deserves to be further investigated.

There are several studies that have relevance to this study. In 2003, M. Thurmudi (in Sahlan, 2009:10) had conducted research *Praktek Pendidikan Agama Islam di Sekolah*. In this study, Thurmudi finds that there are five dimensions in the practice of religious education, namely (1) the dimensions of knowledge / religious knowledge, (2) the dimensions of ritual / religious practices, (3) the dimensions of ideology / belief / religious belief, (4) the dimensions of experiential or dimensional experience / religious feeling, and (5) the consequential dimension / religious effect.

Then, Masdar Hilmy did a study *Islam Profetik (Substansi Nilai-nilai Agama dalam Ruang Publik)* in 2008; which its focus is religion in the universal perspective. The study found that it displays in terms of prophetic religion liberate humanity from all forms of shackles and oppression.

Furthermore, Asmaun Sahlan had done research *Mewujudkan Budaya Religius di Sekolah (Upaya Mengembangkan PAI dari Teori ke Aksi)* in 2009; which is the focus of research is the development of PAI in realizing the religious culture in schools. Sahlan's study found that the need for systematic efforts to develop Islamic Religious Education (PAI) so that the religious culture in schools can be realized. These efforts include (1) the addition of classes, (2) improving the quality of learning, (3) development of extracurricular, and (4) cultivation of religious values.

Thurmudi,s research (2003), Hilmy's research (2008), and Sahlan's research (2009) show only the implementation prophetic values of Islamic practice in school life. The research findings still exist in a similar normative level. On this fact, the researcher asked "what kind of leadership if there were an research on principals who have different religious backgrounds?" Coinciding with this question, in 2013, Pani Hadi wrote *Hamengku Buwono IX Inspiring Prophetic Leader*. The contents of various articles in anthologies that inspired the concept of prophetic leadership is defined as a model of leadership that embodies the values of the prophetic aimed at the welfare of mankind. This inspiration gave birth to further questions as "What is the prophetic leadership applied to the school principal?"

METHODS

This study employs a qualitative research approach. A qualitative approach is an attempt to understand the subject from the standpoint of the subject itself (Arifin, 1996:50). Bogdan and Biklen (in Ulfatin, 2014:23) formulate qualitative approach as a research procedure that produces descriptive data of the person or the behavior observed. Ulfatin (2014:23) defines qualitative research as:

The research aims to understand the phenomenon of what is experienced by the subject of the study such behavior, perception, motivation, action and others, holistically, and by way of description in the form of words and language, in a specific context that is naturally and by utilizing various scientific methods.

The main data sources are the principals of SD YIMI Fullday School Gresik, the principal of SDK Santa Maria II Malang, the principal of Metta School Surabaya. Each of them interpretates the prophetic leadership. This study is not intended to test the hypothesis, but to collect the data, to classify it, and to interpret it in order the researcher finds a new principle that can be described through an exposure of research results (Ulfatin, 2014:24). The next source are some informants who were selected on the recommendation of their principal. According to Lincoln and Guba (in Moleong, 2010:132) states that, "the informants help the researcher in order that the researcher can be able to immerse in the local context". The informants assist the researcher in collecting as much as possible data in a relatively short time. Informants consist of two teachers (educators), three students, three school staff (TU employees, security guards and janitors), and two parents. The researcher got information from informants about the form of prophetic leadership shown by the principals.

This study carried out by following a process of qualitative research "case study type". The case study is a series of exploratory activities to create descriptions and analyzed intensively and detailed a symptom or social unit such as individual, group, community, or institution (Wiyono, 2007:77). Ulfatin (2014:25) formulated the case study research method emphasizes disclosure of the data, the facts in detail to an object or event. Figure 1 shows the process of case study research.

Figure 1. The Process Of Case Study Research by Miles & Huberman (in Ulfatin, 2014:50)

Figure 1 above formulates a case as a "phenomenon of some sort occuring in a bounded

context". In the context of research on "the Prophetic Leadership of School Principal", prophetic leadership is a phenomenon in social interaction in a social unit school. Therefore, the nature of this study is exploratory and descriptive for the answers to the question "what" is found through a study of the background circumstances and environment interaction in a social unit (Arifin, 1996:57; Ulfatin, 2014:59).

Figure 2. Multicase Research (Arifin, 1996:60 & Surbakti, 2006:205)

Furthermore, figure 2 shows multi-case studies as the study of the two or more subjects, settings or data storage (Arifin, 1996:59). Procedures of multi case study departs from the single case to subsequent cases, so that the cases studied had two or more subjects (Arifin, 1996:60). In this study, there are three principals as the subjects of the study. Multi case study is an attempt to better understand the focus of research because the second data will sharpen the first data and the third data will sharpen the meaning of the first and the second data. Miles and Huberman (in Ulfatin, 2014:67) assert that by multi-case studies, the researcher can make precision, validation, and stabilization of the findings.

RESULTS AND DISCUSSION
Results
Findings of Individual Cases

Prophetic Leadership strengthen school leadership models and strengthen the character of the school. It is based on the findings of research. The following are the findings of the three studies on three principals of elementary school concerning on the prophetic leadership.

Research findings in Case 1 (SD YIMI Fullday School Gresik)

The research findings will be presented in the order in the focus of research.

a. Prophetic values spread by the principals to stakeholders.
   1) School as a place to develop a prophetic character; and, learn the values of the Islamic faith are values received from the principal.
   2) Religious activities throughout the school community; development of potential interest-talent students; development of life skills; learning environment; social learning; silahturahmi; religious tour; in any opportunities, the principal gives prophetic values in the life of the school community.
   3) Effect of prophetic value in the lives of stakeholders can be felt in the life of the school community. It makes the teaching profession as a vocation that must be lived voluntarily and that to be charitable-worship; sharing to improve the quality of life and togetherness; jointly improve welfare. Then, the students know the behavior that are expected to emerge, namely: to understand, appreciate, and memorize the holy Koran; prayers; not arrogant; polite; do not talk dirty and rude; not hostile; talk and behave delicate to anybody; study diligently; not ignorant and fight; not naughty, not ignorant, and do not steal; filial to parents and teachers. Furthermore, employees feel comfortable and familiar with each other, help each other, work with sincerity and devotion. Finally, recognizing the importance of values prophetic, parents encouraged to participate in filling the Buku Anak Saleh; participate in school activities; provides sharing of experience in carrying out religious activities.

b. Principal's strategy for conserving prophetic values in school life.
   1) The principal leads with religious principles and mobilize teachers, employees, students, and members of the community to do something to the success of education programs in schools. The school principal also provides exemplary life in everyday life at school.
   2) The principal gives respect to his subordinates; communication to build understanding; deliberation to find the word consensus to create a school as a working environment that embodies the values of prophetic harmonious, healthy, dynamic, and comfortable so that members can work with the full productivity and obtain the highest job satisfaction.

c. Principal's strategy for accommodating prophetic values in school life.

1) The principal of the school invited residents to run the Five Pillars of Islam; start and end teaching-learning activities by praying and reading the Holy Koran; give quality time as a means to relate with parents to strengthen and develop the potential of the heart / conscience / affection of school community based on the prophetic values.

2) Principal uses self-evaluation tools based on the verses of the holy Koran, the *Buku Anak Saleh*, and the formation of *laskar kebersihan* to correct the behavior of people in schools that do not correspond with the values developed by the school.

3) The principal builds personal character so the school community sees him as a good person, can guide, can be an example and role model, assertive, professional, work according to schedule, active activism, still young but knowledgeable to develop the habits and behavior of people in schools commendable and in line with the prophetic values instilled by the school.

4) The principal invited residents self-assess /evaluate programs/activities with mirrored to interpret the verses of the holy Qur'an that constantly read and ponder both at school and in everyday life to develop the school as an environmental milieu learning in line with of the prophetic values.

d. Principal's strategy for introducing prophetic values to stakeholders.

1) School is the place to build a noble character and liberation from ignorance of the law, stories of the prophets, and the story of the Prophet Muhammad's example is a prophetic values.

2) The lack of participation of parents and the community to make the school as a source of the emergence of awareness of religious duty are the obstacles in incorporating the values of the prophetic in the life of stakeholders.

Research Findings in Case 2 (SDK Santa Maria II Malang)

The research findings will be presented in the order in the focus of research.
a. Prophetic values spread by the principals to stakeholders.

1) The principal instill the understanding that school is a place to live Christian values and relationships between the school community is the basis to form a communion of life.

2) The prophetic value sinternalized by the principal affect the lives of stakeholders. In this context, the principal instills understanding that teachers educate children with exemplary attitude; have personal integrity. Then, principal ask student for being honest (not lying), hard work, responsible. Students should not talk dirty words, be discipline, not underestimate the little things, like helping a friend, be polite; engaged in activities along with the poor people in the month of Ramadan as a form of sensitivity to the surrounding environment; be sensitive and concerned about the condition of others, behave, prayerful and to the Church; help others.

b. Principal's strategy for conserving prophetic values in school life.

1) Principal embrace all people in schools; meeting to build understanding and understanding of teachers; empathy (putting yourself in the other person's position) to move the teachers, staff, students, and members of the community to do something to the success of education programs in schools.

2) Principal gives exemplary action.

c. Principal's strategy for accommodating prophetic values in school life.

1) Principal School invites residents to always remember/keep returning to the fundamental source/destination where school principals as a way of strengthening and developing the potential of the heart/conscience/ affection of school community based on the prophetic values.

2) Leadership as a form of appreciation of the values of life as a nun; monthly regular meeting; The annual work meeting, recollections and retreats and as a medium to reaffirm the important role the vision and mission of the school as a means of correcting the behavior of parents that is not in accordance with the values developed by the school.

3) Principal develops the habits and behavior of the school community are commendable and in line with the values instilled by the school prophetic. The school principal shows attitudes down to earth, simple, like smiling, friendly and nice, while respecting the people.

d. Principal's strategy for introducing prophetic values to stakeholders.

1) Educate according to the example of Jesus; faith in divine providence; solider; sensitive; live in fellowship; equality of dignity; becoming a whole person is a prophetic

values championed Principal in the life of stakeholders.

2) Participation and low parental participation in school activities are obstacles in the prophetic enter values in the life of stakeholders.

Research findings in Case 3 (SD Metta School Surabaya)

The research findings will be presented in the order in the focus of research.
a. Prophetic values spread by the principals to stakeholders.

1) Principal states that school educate its students in high morality, integrity, courtesy of manners and language, the benefits of science, and generosity as an expression to give students the atmosphere of Buddhism.

2) Various school activities into opportunities that were principals in the prophetic enter values in the life of the school community.

3) The principal gave the understanding that the first teacher attitude is exemplary; firm but not hard; harmonious interaction with all teachers; train reverence and devotion to parents; fosters responsibility of the student; loyal to the school and to participate actively in these activities; *Di Zi Qui* is applied in everyday life.

b. Principal's strategy for conserving prophetic values in school life.

1) The principal of Siddhartha Gautama is applied as a way to mobilize teachers, employees, students, and members of the community to do something to the success of education programs in schools.

2) The principal applies the messages in the book Di Zi Qui as a guide to creating the life of the school as a working environment that embodies the values of prophetic harmonious, healthy, dynamic, and comfortable so that members can work with the full productivity and gain job satisfaction highest.

c. Principal's strategy for accommodating prophetic values in school life.

1) Principal strengthen and develop the potential of the heart / conscience / affection of school community based on the values prophetic by pointing out that since its establishment, SD Metta School carrying value of "educating the heart and soul of the young" as a slogan.

2) The principal trains the values taught by the book *Di Zi Qui* as a way for

correcting the behavior of people in schools that do not correspond with the values developed by the school.

3) Principal develop the habits and behavior of the school community are commendable and in line with the values instilled by the school prophetic. School principals develop personal character well, a draw in making the decision, decisive, authoritative, knowledgeable, courteous, make people comfortable, friendly, exemplary, professional, humble, neat, clean, like a smile, friends talk to men, open, diligent, not late, become the idol of students, discipline; patient.

4) Know the message of Buddhism through education in order to become a virtuous person.

d. Principal's strategy for introducing prophetic values to stakeholders.

1) Siddhartha Gautama taught how man can live happyly. It will happen if man knows the source of suffering and an eight way to achieve happiness.

2) Lack of understanding as well as low parental participation in school activities is an obstacle for introducing the prophetic values in the life of stakeholders.

Discussion
Prophetic Values Spread by the Principals to Stakeholders

The study findings showed similarities across cases of three principals. They were able to bring the people crossing times difficult transition in the life of the institution. Courage is based on the belief that the fruit will bring good thoughts. It is accompanied by the ability to establish relationships and communication.

The theory of personality traits analyze the characteristics and personal characteristics that differentiate leaders from non-leaders. Factors that comes from himself, that notion is concerned about leadership, values, or the pursued within the leadership, or the experience of placing a charismatic leader to have such attributes, enthusiastic and courageous (Robbins, 2003:433). More profoundly, there are six characters that distinguish leaders from non-leaders, the ambition and passion, the desire to lead, honesty, and integrity, confidence, intelligence, and knowledge relevant to the job (Kirkpatrick in Robbins, 2003:433). In addition, people who have a nature-aware strong self - that is, very flexible in adjusting behavior merela into different situations - likely much greater emerge as leaders in groups rather than their nature-aware he was weak (Dobbins in Robbins, 2003:433).

The principals is intelligent and visionary figure. Foresight expressed by them are the result of thinking about how to improve the quality of self-agency, both personnel, management system, organizational structure, as well as infrastructure. They prioritize responsibility, devotion, and obligations that must be fulfilled in undertaking the vision and mission of the institution. In this regard, Imron (2014:6) states that the leadership prophetic in educational institutions is a leadership hearts, educate the conscience (conscience), your sincere heart is always positive and filled with a sense of devotion to God and always wanted to uphold morality in context the institution he leads.

Prophetic leadership style in building organizational culture can be carried out by four steps:(1) the pure intention of building an inner quality is excellent in the lead. With a prime inner quality, community organizations will have the full attention to each task; (2) develop a quality culture by building a core belief (core believe) and core values (core values) to community organizations that live and work essentially the worship of God, it must be done with the best; (3) develop brotherhood among members of the community, so that collaboration, synergy between individuals and groups / units within the organization can be created to empower the potential and power to the fullest; and (4) develop ethical behavior in working through the cultivation of gratitude and patience in undertaking. Thus, theoretically prophetic leadership is the ability that reflects the spirit of religious consistency humanizing, liberating, and a new dimension of divine solid-match with a human dimension.

Prophetic leader runs his leadership not only by using his intelligence alone, but at the same time involve the Lord God Almighty, through guidance or instructions received from Him. His life is an investment for the humanity of the higher, nobler, and more dignified. The size of which is open and can be known by the public, the leadership prophetic educational institutions have a behavior measured in the form of (1) uphold virtue, (2) resolve the conflict for the good of all, (3) conduct mutually beneficial cooperation, (4) to think of the next generation , (5) share and personal initiative, (6) honesty and personal responsibility, (7) an example of serving, and (8) caters for all.

Principals' Strategy for Conserving Prophetic Values in School Life

All principals lead the school in a multicultural city where people store large cities as a result of the potential problems of various kinds of social background, economic, and cultural population. The three cities that have a high economic growth. However, access to welfare and prosperity feel uneven. This situation has the potential to cause social problems. Thus, if the high expectations for the work, but without the depth of religious and moral strength, the young people are in danger of sedentary behavior, disorderly, undisciplined, and away from religious norms.

All principals initiate conservation measures by establishing a personal spiritual wake before forming a spiritual wake the school community. Getting them to move educators, employees, students, and members of the community to do something to the success of educational programs in schools showed that all three showed the same interest in spiritual development that eventually put them on a moral consciousness that upholding universal values life. Furthermore, they succeeded in realizing the condition of the school as a working environment that embodies the values of prophetic harmonious, healthy, dynamic, and comfortable so that members can work with the full productivity and obtain the highest job satisfaction.

The study findings showed similarities across cases in the strategy for conserving the principal prophetic values in the life of the school community. Prophetic leadership they display is substantive, namely the prophetic leadership born of spiritual appreciation of the three principals and their closeness to the Divine reality and the spiritual world. Prophetic leadership model they converge in personality and behavior of daily life.

Mulyasa (2003:256) states that there are many teachers, staff, and students who are afraid to express their problems to the principal. Problems were they going to distract them in fulfilling the tasks and the ultimate goal of their presence in the school. According Mulyasa, empathic attitude and feel the problems presented by the principal to those who are having problems is a relational alternative to reduce tension in the life of the school. That way, the school principal maintain good relations and set an example for the entire school community in solving the problem. In the same occasion, the head of school to help lighten their load, which in turn will be beneficial to improve their performance.

Principals' Strategy for Accommodating Prophetic Values in School Life

The study findings showed similarities across cases in the strategy of three principals to accommodate the prophetic values into the life of the school community. All three principals instill key values in the lives of those around him to be disciplined, modest, polite, behave well as honest and sincere. All three principals strengthen and

develop the potential of the heart / conscience / affection of school community based on the values of the prophetic.

Spiritual abilities making it able to take into account the situation, place, and context in attitude and action. Leadership behavior is the fruit of reflection and contemplation of mental and spiritual. A leader is always the audience is expected to be an example. His behavior, his speech, and even his appearance is expected to contain no reproach. Intelligence, good manners and even physical and spiritual strength is expected to have a quality above average.

The leader is a projection of all kinds of virtues. Outward expression is never angry: angry against virtue because by the time a person gets angry he loses self-control. The headmaster correcting the behavior of the school community are incompatible with the values developed by the school based on the manual / checklist that is used as the standard of behavior expected. He would keep reminding his subordinates not to commit the same mistake on another occasion, but he speaks not with "grumpy". Although he has a firm stance and firm stance, he remains "nguwongke" subordinates. Because it forms a correction of deviant behavior displayed by them not as retaliation or punishment, but as a consequence of the choice of action has been decided. That way, the three principals to familiarize people in schools to always think long and weigh weighing the result of a decision before making a decision and do it. That way principals develop the habits and behavior of the school community are commendable and in line with the values instilled by the school prophetic is not the method to frighten, but rather the method of sharpening, compassion, and parenting. Under conditions of this study, the principal still able to maintain authority in accordance with their rights and responsibilities. Deeper, head of development of the environment of school life as a learning environment that is consistent with the values of the prophetic through positive radiant energy, their own creativity, emotional stability, and constancy of their personal spiritual growth developed.

Principals' Strategy for Introducing Prophetic Values to Stakeholders

The study findings showed similarities across cases of three principals in perspective shows local wisdom, in the sense of the wisdom shown by the vision and mission of the institution:community development oriented projects. In this context, all the local's it means the value of Islamic maintained and further developed in SD YIMI Fullday School Gresik, the value of catholicity treated and cultivated in the SDK Santa Maria II Malang, or also the value Buddisme treated and cultivated in SD Metta School Surabaya. All three principals to put the process approach as a way of learning that must be passed by the school community. They did not put the success of education on the foundation that prioritizes the results of mere pragmatism. They were aware of his position as head of the school is a trust that must be carried (in terms of Hindu word "dharma" which means leadership as self service).

All three principals to enter a dimension that does not exist in modern leadership models that tend to do everything so that the specified target is reached (such as the model of management by targets or by orientation). "Matra" is the dimension of "rasa" (the word Java language to express the affective dimension communal) who put personal interests (aspiration or ambition principal) not as the main elements that must be fought, but as an element of "existing together" with elements of the another part of the community (Hadi, 2013:321).

The ability to weigh the "rasa (Javanese word)" will give birth to a balance or harmony which is the fruit of harmony and mutual respect fellow human beings. This perspective makes the society or the "other" as an important part in the existence of "personal"; not as a worker who is positioned as an object or a part of a threat to the ego and the "I".

Keating states that in performing the task of leadership affects a group of people heading to a specific destination, a leader is influenced by several factors (Keating, 1982:18-20). In the case of prophetic leadership, factors that affect leadership are factors derived from itself, that notion is concerned about the realization of the values or religious significance to be a minimum set through leadership. Values or religious significance was moving southwest leadership is concerned that anything he does is an expression of what he believed in religious life.

Based on the above, the prophetic leadership brings forth dimension to the dimension of divinity. God is a true leader who inspires, influences, serving and stir the conscience of His servants with a very thoughtful approach and exemplary ethical. Therefore prophetic leadership also called leadership that is based on religious ethics and religious intelligence, based on faith and conscience. Integrity and credibility itself is a guarantee for the work and efforts. The soul of compassion or feelings of compassion, generosity, solidarity and mutual assistance and shelter to all those displayed by a prophetic leader is the antithesis of the situation era featuring hedonism, consumerism, pragmatism, and transaksionalisme. Tobroni (in Arifin, 2014:7) confirmed that the

leadership based on values is a realization of the 21st century is called the century of the values. Nowadays, people is seen as living in the crisis of values (Arifin, 2014:8).

Propositions as the Result of the Research

After going through the stage of discussion, this section states that research propositions presented in order of research focus.

Proposition 1: Prophetic values spread by the principals to stakeholders.

a. The school principal shows a way ol life based on the prophetic values.

b. The school principal uses different ways for implementing prophetic values in the life of the school community.

c. The dissemination of the prophetic values affects the lives of stakeholders.

Proposition 2: Principals' strategy for conserving prophetic values in school life.

a. The school principal embodies the prophetic values.

b. The school principal shows the prophetic value with three aspects:(1) pattern, (2) respect for the dignity of human life, (3) affection.

Proposition 3 Principals' strategy for accommodating prophetic values in school life.

a. The school principal directs each person to be aware of the purpose of human existence and role in the world.

b. The school principal is committed to preserve the prophetic value in order the principal can correct behavior that is incompatible with the school's values.

c. The school principal shows consistency to develop habits and attitudes with the prophetic values.

d. The prophetic values are cared for creating environment of the school as a learning environment that is consistent with the values of the prophetic.

Proposition 4: Principals' strategy for introducing prophetic values to stakeholders.

a. The values worth fighting prophetic principals in the life of stakeholders.

b. Lack of understanding and participation of parents and the community are barriers to grow up the prophetic values in the life stakeholders.

CONCLUTION AND SUGGESTION
Conclusion

Prophetic Leadership (prohetic leadership) is a genre or the prophetic leadership of the new leadership. Prophetic Leadership featuring a leader who combines intellectual ability, cultural, emotional, and spiritual to serve a lifetime with full sincerity, selfless, except as worship.

Suggestion

Chairmans of the YIMI Foundation Gresik, the Metta School Foundation Surabaya, the SDK Santa Maria II Foundation should deepen the prophetic values within its institutes as a foundation for making of the vision and mission of the foundations. Principals of SD YIMI Fullday School Gresik, SDK Santa Maria II Malang, SD Metta School should have confidence that the prophetic leadership brings distinctiveness to their school. Kepala Dinas Pendidikan Kota/Kabupaten should review the vision and mission of every state school. They should be based on thoughts or idea of the founders of the nation and the national history of Indonesia. Other researchers can make this research as a starting material in performing similar research or advanced research to develop knowledge, especially with regard to the theme of this study, such as the leadership of local knowledge, educational leadership by implementing local wisdom.

IMPLANTATION CLOUD COMPUTING ON TEACHING MATERIALS

Sihkabuden

State University of Malang

E-mail: sihkabuden.fip@um.ac.id

ABSTRACT

The paradigm of cloud computing by Gluria (2013) is an optimal blend of hardware and software as a virtual service resources so that users are free from the burden of concerns about the management of the service system. The study of this development have an umbrella research open source web-based learning platform. Thus derived in the form of practical development of products that take advantage of the development of learning web-based cloud computing according to the characteristics of the source of learning, learning content, learners, learning strategies and learning methods in the context of S-1 Student Educational Technology Department, State University of Malang.

Keywords: *cloud computing ,teaching, materials.*

Cloud computing is a computing paradigm latest. The paradigm of cloud computing by Gluria (2013) is an optimal blend of hardware and software as a power source virtual services so that users are free from the burden of worries about system management services. Migrating Web applications to Cloud Computing services and integrate services Cloud computing into the infrastructure is something not easy. This led to a new paradigm that often require innovation paradigms and practices at all levels: technical, cultural, legal, regulatory, and social.

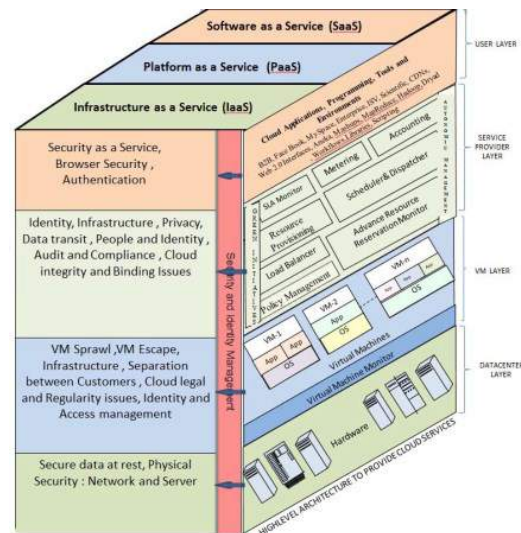
Cloud Computing offers a dynamic learning resource that is measurable. Learning resources provided by cloud computing services by reddy (2011) is a service over the web that guarantees many economic benefits as well as having the advantage can be distributed among penggunanyanya. Cloud computing, which was created in late 2007, when it emerged as a hot topic because of its capability for technology offers a dynamic and flexible as an Information technology infrastructure, computing environment and software services are configured. as reported in Google trends shown in Fig. 2, Cloud computing (yellow line), virtualization technology (yellow line), has exceeded Grid computing (Red line). Many projects in industry and academia have already started, such as IBM and EU for Cloud computing, Amazon Elastic Compute Cloud, IBM Blue Cloud, a project such as Nimbus Cloud scientific and Stratus, and Open Nebula. HP, Intel Corporation and Yahoo! Inc. recently announced the establishment of a multi-data, global center, open source Cloud computing for industry, research and education.


Figure 1. Security Architecture of Cloud Computing. (Reddy.2011)

In general, there are still widely accepted definition for Cloud computing Cloud computing although the practice has attracted much attention. Some of the reasons leading to this situation: Cloud computing involves researchers and engineers from various backgrounds, for example, Grid computing, engineering software and data bases. They are working on cloud computing from a different angle. The technology that makes Cloud computing is still evolving and progressing , for example, web 2.0 and Service Oriented Computing. Cloud Computing that is still lacking large-scale

deployment and use, which in the end will justify the concept of cloud computing.
Figure 2. Reports Google Trend

Department of Educational Technology, State University of Malang is an institution that is always in contact with the culture of behavior studied global, global culture is always influenced by the powerful culture of developed countries such as the countries in the Americas such as the United States and Canada, countries in Europe like Britain and Germany, countries in Asia such as Japan and China. Friction culture is experienced by students of S-1 Department of Education Technology, state University of Malang that is characterized by the use of learning resources globally. References, Lecturer, access url addresses, broadcast largely a product of global culture. behavior learning is the global behavior of learning is no longer limited by the classrooms. more extensive global culture has dimensions of freedom are taught using instructional media optimally as an example correspondence, learning by using the broadcasting such as radio and television, learning to take advantage of networking such as LAN, WAN, intranet, internet and others. Department of Education technology, State University of Malang is majoring in the fields of science technology education and learning was also influenced by global culture. it is characterized by the use of information and communication technologies in the learning activities as well as in the search for learning resources. information and communication technology has always been a topic of discussion and once used as a tool in the search for, process, manage, display and deliver learning resources. This is the reason that the Department of Education technology, State University of Malang will follow the global culture by implementing the development of information and communication technology in education and learning.

Department of Educational Technology, State University of Malang is continuously working to develop information and communication technology as a form of service to the faculty and students. This effort is demonstrated through the provision of various facilities information and communications technology in the form of provision of LAN installations, the installation of Web-site Department of Education Technology, State University of Malang, Provisioning Server Hardware primary, gives students the right to access learning resources through certain lines, and to support learning activities, especially the needs of the learning resources, in the Department of Educational Technology, State University of Malang has been installed network facilities, access devices and the Internet to reach in the whole environment TEP as information and communication services learning resources which can be utilized for both lecturers and students.

Department of Educational Technology, State University of Malang has a commitment to develop information and communication technologies geared to the empowerment of all the facilities available in the Department of Educational Technology, State University of Malang in turn will support the department in the execution of its programs, including the provision of learning services via the web. Department of Educational Technology State University of Malang have a desire in the learning process through the web in order to facilitate the majors in controlling the activity academic, lecturing and presenting related subjects. The attention of students to learning resources can be increased by way of increasing the academic atmosphere campus (Runtuwane, 2007). Department of Education Technology, State University of Malang has developed majors become Fitness Services Learning in the Internet. On a larger scale the service is part of the Internet services Provider (ISP) . Development of the Department of Education Technology, State University of Malang as Centre Services Learning in the Internet is built means the server hardware that serves some local lines, internet and INHERENT. server Internet that serves public Internet network, server INHERENT airport network among universities in Indonesia and a Local Server networks that serve specialized in the Department of Educational technology, State University of Malang. Device Information and Communication technologies were also developed, among other broadcasting technology. hardware lab stations malayani learning needs of the audience up to a radius of 10 km and hardware laboratory television stations.

Hardware requirements as a means to help the development of web-based learning have been given priority in the Department of Educational Technology, State University of Malang. Hardware requirements include device access services on-line. The hardware the other is the service to the academic community to be able to conduct free internet access and internet on a computer that netted interconnection and provision of internet and intranet access device dots for users who use personal mobile devices. On the development of the hardware necessary to use the standard rules of management and infrastructure services resulting from the analysis and evaluation of the hardware implementation in web-based lectures on-line system in institutions

Needs Brain ware as a developer of web-based learning also get priority in the Department of Educational Technology, State University of Malang. The need for such developers include concept development and implementation of learning the system on-line web-based. The concept and implementation of applied so far in the development of learning systems at the Department of Education Technology University Malang derived directly from the implementation of information technology. The rule, aspects and learning theory at all is not taken into consideration the development of teaching and learning resources.

Department of Educational Technology, State University of Malang in the lead to the development of learning also have constraints. These constraints are 1) the use of on-line learning media is still seen walking alone yet is integrated together and coordinated at the level of administrator. It is seen still using web-separate web like Yahoo, Google, etc. messenger. In the Technical Department of the Department of Education Technology, State University of Malang yet have a platform that is becoming benchmarks and standards for the development of instructional media. 2) Together with the lecturers still preoccupied manage learners in learning activities. Both in the activities room scheduling, faculty and students. This is because the increase in the number of learners who are less dimbangi with a capacity of learners and learning resources. 3) Investment software on-line learning is not an infestation that is very expensive. this is because the license is applied for the use of the system.

CLOUD COMPUTING IN LEARNING

Universities throughout the world largely started to depend on information and communication technologies to serve the needs of teaching and learning. (Wing Lai: 2011) The use of information and communication technology to support shifting cultural practices in teaching and learning in higher education. The use of information technology also to better meet the needs of 21st century users from academia higher education, information technology and digital communications can provide a learning experience more active and flexible by adopting pedagogical approaches and participatory by combining formal learning with informal learning. Various advantages and disadvantages of a package perceived as the risk of the use of technology. one such package is the procurement and maintenance of various hardware and software specifically require on-going investment and resource skills to support the sustainability of the technology.

Developing countries in Southeast Asia are increasingly recognizing the important role of universities in increasing resources through the use of Information and Communication Technology.(Hong and Songan: 2011) higher education system in the Southeast Asia region are increasingly making use of ICT in addressing the challenges that arise. The challenge is 1) what and how students learn , 2) when and where students learn , and 3) ways to reduce the cost of education . the countries of Southeast Asia are at different stages of development with the developed countries in the use of Information and Communication Technology in education in higher education. thus, sharing experience in the use of Information and Communication Technologies in higher education is very important for lecturers and managers who are at the forefront of integrating ICT in teaching and learning activities .

Technology on the "cloud computing" is the advancement of information and communication technology. Package promised is economies of scale are promising and features that are capable of increasing service agencies. Issues latest is a system service "cloud computing" growing a lot and are provided without pay and only use technology Internet. Users from academia as professors, students, staff and policy makers can use the system "cloud computing" by accessing it from a web browser that has been provided. the services offered can be considered cheap or even free for education. In many respects even service availability more higher and better than can be provided by University.

Great design has been implemented by Internet service providers. The trend of future technology began to lead on most of the education services, teaching and learning will take place through the "cloud computing". Institutions as part of the global world no longer host their own data centres due to hardware investments are expensive,

electricity bills swell, payroll manager and a number of features that are rarely fully utilized. The development of a system of "cloud computing" is a masterpiece to make globalization work real ,

PACKAGE SYSTEM SERVICES IN CLOUD COMPUTING

System "cloud computing" offered by various Internet service providers have several packages. Most among such packages are:

Service on the system "Cloud computing" is delivered via the Internet from a data center that has a high specification built in a location away from the user and the institution University High. The server providers already have the features that they have invested in the form of a cooling system the latest and engineering optimization service. If this investment is made by the college, will burden the budget system significantly. These data centers are developed by service providers that are in locations near a source of cheap electricity. Even the location of the data center is not always known to the user, although in some cases the user requires services that are located in certain countries because of data protection laws. the service provider provides access rights and control over data stored by the system of "cloud computing"

Features services such as storage of data, processing, memory and bandwidth are divided proportionally to multiple users and can be dynamically allocated to the service can be allocated based on demand. Components of the hardware provided by the service provider can be replaced without impacting on service learning, learning, performance or even the availability of new space. Management of data spread across multiple data centers in the safe category as the service provider to provide security and resilience with the latest systems.

The main service features of the system of "cloud computing" is elastic and quick. This factor allows the management of universities high and academics who use the system "cloud computing" suddenly doing a service request. System "cloud computing " which has been implemented to date have suggested that the management of scalable service yet able to provide an infinitely to the users. The explanation may be easiest if universities and the academia wants to increase the use of sudden there should be, it is not necessary apply for or purchase any additional hardware which could take weeks and can then be utilized to the maximum.

Management of the budget allocation is the issue of most interest in the use of the system "cloud computing". If the system is "cloud computing" needs budget allocation, users only pay for the services used. The service provider will bear the cost of hardware and the provision of software. In some of the features provided on the system "cloud computing", using features not paid. Thus, the service provider will bear the full costs of the provision of hardware and software.

In general, the management of the service by the user can be done in self-managed. The user can decide what features are used, and add or subtract without having to discuss with the service provider. Reporting facilities are provided so that customers can monitor the use of the feature.

IMPLEMENTATION OF CLOUD COMPUTING

Some education providers even universities that have been using the service learning and on-line learning, yet system using "cloud computing" optimal. Some colleges even have incorrectly assumed towards a system of "cloud computing". The assumption of the system of "cloud computing" is a system in the Internet that does not give much support to the teaching and learning process and not only facilitate the activities organized by the College. College and even confusion between the terms Web 2.0 and the system of "cloud computing ".

The theory of "cloud computing" does not get a deal in understanding global basis. It is also valid on web 2.0 technologies. Blogs, wikis, twitter, facebook and others is a technology which is regarded as the app's Web 2.0. Aplikas web 2.0 technology allows users to change the content of a web page and interact with others through the application so as to create construction information and 2-way communication.
Figure 3. Image *Cloud Computing* TEP UM

Software web 2.0 can be hosted by universities through intranet or publicly accessible via the Internet. In this context, Web 2.0 can be regarded as a specific application types while the "cloud computing" is a system that allows multiple methods in a variety of applications that allow the activity of storage, processing, management, delivery.

CLOUD COMPUTING ON LEARNING SYSTEM

The learning system is a major force in educational institutions in general. The university is an institution of higher education and has a variety of services in the learning system. Trend service college is a service entitled "e-learning". Different versions of the application of e-learning has been used as a means of learning system. Shades of e-learning color every theory, models and even up studies of discussion and research. So that e-learning is a featured service applications in a system of learning in higher education.

System of modern learning cannot be monopolized institutions and tend to be flexible on the type and location of learning resources. College is not possible to close two-way access to the service provider on the Internet. Even the user entity not only on the academic community. So the "chaos" in the era of learning has been anticipated by a very large system that is "cloud computing". exceptional power has emerged and is ready to be applied in Higher Education learning system.

CONCLUSION

In general, the development of web-based learning platform open source on the subject of computer learning S-1 Department of Education Technology, State University of Malang can produce instructional media that utilize cloud computing web-based accordance with the characteristics of a learning resource, learning content, learners, learning strategies and learning methods in the context of S-1 Student Educational Technology Department, State University of Malang

THE IMPLEMENTATION OF *SINAU WISATA* BASED ON POTENTIAL LOCAL EXCELLENCE IN THEMATIC LEARNING AT THE ELEMENTARY SCHOOL MALANG

Siti Fatimah Soenaryo, Erna Yayuk, Dyah Worowirastri Ekowati

University of Muhammadiyah Malang, Indonesia

e-mail: fatimahsoenaryo@yahoo.co.id

ABSTRACT

Generally, this paper will analyze the implementation of Sinau Wisata based on potential local excellence to promote the implementation of the thematic learning in curriculum 2013 through the study of potential local revitalization, especially the Natural Resources (SDA), Human Resources (HR), Geographical, and Historical. This research is conducted at the elementary school of Muhammadiyah throughout Malang. This study was developed through the Research and Development in order to arrest precise meaning of the reality of the communities studied. This study used a descriptive method. The result of the study as one of the guidelines for modeling Sinau Wisata based on potential local excellence that will be implemented in the thematic learning throughout Malang. Due to Malang has a potential of Natural Resources (SDA), Human Resources (HR), Geographical, and Historical. Therefore, it will be very helpful if the Sinau Wisata based on potential local excellenceapplies in learning process, especially at the elementary school. Primary school level is the foundation of learning to the next level.

Keywords: sinau wisata, potential local excellence, thematic learning.

Sinau Wisata based on potential local excellence model as a support in the thematic learning in curriculum 2013, which is a learning tour outside the classroom. Students will learn about the objects on tourist sites directly to integrate of knowledge, skills, values and attitudes, and creative thinking in learning by using themes as the principal environmental review and revitalization of local potential, especially in Natural Resources (SDA), Human Resources (HR), Geographical and Historical. The selection themes among the principles held in this study is a significant theme for student life, adapted to the level of students' progress, describing events with authentic learning resources in the immediate environment and using real situations. Teachers are accommodating to ideas that emerged from the students. Consideration of local knowledge was based on the potential of natural resources, which is safe and support the learning. In terms of human resources, the location has a cultural and artistic crafts, there are expertise areas and work professions. Moreover, in terms of geographic potential, it has a location, mileage, time and historical potentials that are worth considering. Based on these principles, *Sinau Wisata* based on potential local excellence model is considered suitable with the characteristics of elementary school students.

The purpose of *Sinau Wisata* activity is constricted on the students to know more about environment and to concretize the learning media by using surrounding environment.

Noting that purpose, indirectly, the *Sinau Wisata* activity or learning outside the classroom has the function to guide students to learn the object directly, which are recreational and educational as well as strengthen the cohesiveness of the students. In addition, the function of *Sinau Wisata* is to introduce students to the real environment and the potential tourism place in the region. The rationale of *Sinau Wisata* activity is the result of analysis of the needs of the curriculum used and school programs that have been designed before the semester.

The study of the charge in this learning need to be further analyzed. The *Sinau Wisata* based on potential local excellence model is: (1) contextual learning, utilizing the contexts of real life situations; (2) problem-based learning, students concretely confronted on the problems; (3) constructivist learning, students can build his own knowledge of the learning experience with the direct object in the location; (4) cooperative learning, students are given an opportunity to interact and collaborate with their partners; and (5) *PAKEM* (Active, Creative, Effective, and Joyful), students can be active, creative and learning with a pleasant atmosphere.

In regard to questions and feedback about the existing environment at tourist sites, learning *Sinau Wisata* based on potential local excellence needs to be analyzed in depth as well. Therefore, this paper will decipher the analysis of *Sinau Wisata* based on potential local excellence in the thematic learning at the elementary school, Malang.

The Implementation of *Sinau Wisata* in the Thematic Learning

Generally, the concept of *Sinau Wisata* at the elementary school of Muhammadiyah 4 Batu city, elementary school of Muhammadiyah 1, 9 Malang, elementary school of Muhammadiyah 8 Malang regency, and elementary school MI Nurul Islam Tajinan Malang regency have been applied it. 98% of teachers in each school, only 50% are able to explain the concept of this; planning, assessment, and implementation. The cornerstone in the *Sinau Wisata* activity is almost the same in all schools that is to introduce or explain about the phenomenon of nature, social, and culture.

Based on the result of interview and documentation showing that all schools are a place of research has already scheduled the concept of *Sinau Wisata* in each semester. There are 1 or 2 times to perform this activity in one semester. However, some are carrying out this activity as much as 4 times at the beginning and end of semester. Twice out of school and twice around the school. For schools that have been developed, they usually do this activity more. Meanwhile, for the secondary school, they perform this activity at least 1 time in the first half, even combined with other classes.

Subsequently, the steps of *Sinau Wisata* activity are: (1) observation; (2) planning in module manufacturing along with Teacher Working Group (KKG); (3) the implementation of appropriate modules. The advantage of *Sinau Wisata* activity in the thematic learning is the students can perform direct observe and more realistic. Consequently, the learning process is more concrete or real. As Ausabel's theory, it said that in the learning process as concrete like this will establish student's learning to be more meaning full.

In the thematic learning, firstly, it needs to decide the sub-themes of *Sinau Wisata* that is used in the learning process. In deciding the thematic learning activity, *RPP* (lesson plan) and *LKS* (students' worksheet) should be prepared as well. The basic competency and indicator in the LS and students worksheet should be related with the sub-themes of learning.

Based on that basic competency and indicator, furthermore, it will be identification of learning such as natural resources, human resources, geographic, cultural, and historic, and another potential need in the thematic learning. After that, undertake location determination. There are some options of location determination based on the potential local excellence such as the sea, mountains, museum, Learning Park, library, tourism place, and others. Teachers should coordinate with school and parent cares to carry out *Sinau Wisata* activity.

RESULTS AND DISCUSSION

Sinau Wisata based on potential local excellence as thematic learning support in curriculum 2013 is one of learning-tour model outside the classroom, where the students will learn a direct object in the tourism place to integrate the knowledge, skill, value, and attitude, and stimulate to be a creative thinker. The principal of the study is consistent with the revitalization of local potential such as Natural Resources, Human Resources, Geographic, and Historical. Based on the results of observations on the implementation of the *Sinau Wisata* in the thematic learning in the elementary school of Muhammadiyah in the Malang city, Malang regency, and Batu city, it has known as below.

The majority of elementary school teachers in the Malang and Batu city area, lots were aged less than 45 years. Those teachers still have the energy, enthusiasm and willingness in carrying out thematic learning. It is also supported by the teachers who are mostly excellent to operate a technology. Various needs in the thematic learning are also supported by parent cares that are most of them having a high awareness of children need in education. On the basis of awareness that children need a higher education for the future, creating a family atmosphere as conducive as possible is very helpful for their children to learn. On the other hand, Malang, Malang regency, and Batu city have a spectacular potential local excellence. Malang is education city. There are more than 10 colleges over there. Whereas, Batu is a small city but it had a number two tourism destination throughout Indonesia. Moreover, besides, the beach is still the flagship tourist spot located at the Malang regency. Therefore, the potential local excellence in three regions strongly supports the learning process, especially the thematic learning at the elementary school. The determination of the locations used in this study is based on the identification requirements as described above.

However, the majority of teachers in primary schools consider that the concept of the potential local excellence area has a different concept from the field of education. Efforts to increase the potential local excellence are considered not equal, even not in line with efforts to improve the quality of education. Teachers mostly have a paradigm that learning must always be in school. The learning methods with lectures become the main method which is performed by teachers, especially by teachers at the elementary school of Muhammadiyah. Learning by using the potential local excellence is considered a strenuous activity,

and materially. The students are excited to undertake learning activities outside the classroom, but they were often disappointed with the worksheet that was given by teacher because the worksheets inhibit the process of playing the students. This is because, student worksheets are given is often not associated with activities outside the classroom. Therefore, students' worksheets have to be adapted to the location of learning outside the classroom. Using a variety of different ways and as interesting as possible in order to improve the quality of learning in the Malang, Malang regency, and Batu city.

Improving the quality of teaching in the three areas mentioned above will be done through cooperation with universities. Fully supported that granted by the government is very direct impact on improving the quality of learning in Malang, Malang regency and Batu city. Moreover, many universities in the establishment of these three areas have a positive impact on the development of education. The existence of research activities, student internships and all programs that synergize the schools and universities realize the interaction, either directly or indirectly. The process of quality improvement is synergistically namely in the fields of tourism and education, economic, social, political, and so forth. Therefore, through these programs makes Malang, Malang regency and Batu city will be developed and qualified.

CONCLUSION

The implementation of *Sinau Wisata* based on potential local excellence in the thematic learning at the elementary school of Muhammadiyah in three areas; Malang, Malang regency and Batu city is needed. The process of improving the quality of education needs to be done in synergy with a wide range of fields, either in the field of tourism and education, economic, social, political, and so forth. Therefore, by synergizing various fields with potential areas local advantages, the region will be developed and qualified.

DEVELOPMENT RESOURCES COURSE KINESIOLOGY BASED MOBILE LEARNING FOR STUDENTS FACULTY OF SPORT SCIENCE IN EAST JAVA

Siti Nurrochmah; Supriyadi

State University of Malang, Indonesia

Email: siti.nurrochmah.fik@um.ac.id

ABSTRACT

Unavailability of learning resource materials kinesiology-based mobile learning, resulting in learners have difficulty studying the materials provided. A research on "Development of Learning Resource Materials Kinesiology-Based Mobile Learning. Research and development objectives of developing a learning resource materials based mobile Learning Kinesiology Sport. The study uses a conceptual model, subjects try to include subject experts and potential users. Data were analyzed with descriptive statistics. Results of data analysis obtained 88.57% of the products produced showing the accuracy, suitability, and efficient time and 85% of instructional media showed practicality, the attractiveness and usefulness. Conclusion of the study that the resulting product indicates the accuracy, appropriateness, meaningfulness, the attractiveness, usefulness, practicality, and not difficult to use mobile learning to lecture at the Faculty of Sport Sciences.

Keywords: learning, kinesiology of sport, a source of learning, mobile learning

Phenomena that exist today, associated with the development of technology and information now, has opened up opportunities for everyone to be able to learn independently and quickly which means that anyone can be first to identify and acquire new knowledge including knowledge-based technology (Darmawan, 2012). Educators learning innovation particularly important to change attitudes towards learning model based instructional technology to keep pace with technological developments and progress toward particular learning technology lectures kinesiology (Anitah, 2014).

Learning in college, students as learners important active learning and interacting with peers (peer insteraction) to communicate the material. In an effort to meet these conditions, lecturers as educators is important to use appropriate learning technologies in order to improve the competence of students to access material that is supplied from a variety of learning resources used (Yamasari, 2010). Utilization of information and communication technology in education is very urgent to respond to the challenges of life-paced world of technology. For that college graduates who want to be accepted in the world of work should start initiating technology-based learning (Davis, 2013). Students as the largest stake holder will characterize the performance of the college. Innovation efforts in the field of education and learning is done by the use of multimedia equipment which is currently felt to be more effective against the educational aspects of the use of old methods (Dwiyogo, 2008).

The more advanced science and technology and the human horizon result in every future generation should learn more to become educated man. So that the education system can be implemented more effectively, learning resources are utilized not just limited to humans or books but non-print resources is currently a trend and more effectively used in the student environment (Papalia, Olds & Feldman, 2008).

Currently the media and the tool will no longer be the result of human knowledge, but also as a means to communicate knowledge and specific skills and knowledge and new skills. Besides, information standardization in the process is absolutely indispensable for learning activities in order to improve the quality of education (Arends, 2008). The existence and use of learning resources such as nonprinting form m-learning brings students to the mastery of science that is contextual and meaningful as studied by the community of learners and applied to community of learners that also (Dwiyogo, 2010). The media's role in the implementation of learning has characteristics (Joyce, Weil, and Calhouin, 2009): (a) as the infrastructure to deliver the presentation of information, (b) the existence of a series of options which require among other physical changes where and how to learn, (c) improve the direct relationship between educators and learners, (d) increase the activity of learners in learning more independent and change their roles and skills as well as educator skill mastery over increased optimally.

The use of multimedia by embracing instraksional technology is the right solution to

facilitate the implementation of learning (Setyosari & Sikhabudin, 2005) including the timing of the study subjects of Kinesiology the Faculty of Sport Science. Most Student Sport had difficulty in learning and mastering the material Kinesiology Sport. This is supported by the availability of learning resources such as printing and nonprinting reference books are still very limited in number in the campus State University of Malang, consequently the process of understanding and mastery of the material presented obstacles.

Dwiyogo (2010) found a source of learning has an important role to facilitate the level of mastery of knowledge and skills learned, so the availability of learning resources for learners is an important and much needed. Learning resources (learning resources) are all good sources in the form of data, people and a particular form that can be used by learners in learning, either separately or as a combined making it easier for learners to achieve a certain competence (Anitah, 2013). Abdulhak and Darmawan (2013) found in learning resources must emphasize the process of learning rather than teaching process. With the learning resources, will reduce the role of the teacher as a sender information.

In the field of Sport, movement made by every individual should be done with the efficient movement because the movement that will efficiently support successful in a show of the work done. Efficient movement, there are several requirements that must be met is performed with relaxed movements, using the correct technique and motor coordination is needed. Perfection of high sports skills depend on the ability of the offender to apply the principles of biomechanics and kinesiology appropriately and correctly (Hamilton, et al, 2008). Any movement that is displayed should be analyzed in terms of aspects Osteology, myology, and arthrology it is important to prevent injury to any actor. As a key determinant of success and failure of a work staged in a movement is determined by several factors, one of which are elements of the general motor ability (Jensen, et al, 1984). This has resulted in the Student Sport had difficulty in learning and mastering the material Kinesiology Sport.

Therefore, to overcome the difficulties of the students in learning the material Kinesiology, needed learning resources are more practical and learning resources that can be taken anywhere and learning resources that can be utilized at any time, so that learning can be done anywhere and anytime with fast process and more efficient time. To meet these

expectations, learning innovation is needed to attract learners are motivated to learn and encourage students to learn independently and foster self-confidence is getting stronger for the realization of learners character (Kresnadi, 2009).

Innovation interesting and appropriate learning materials needed in kinesiology, this is done by changing the strategy/learning model to the conventional technology-based learning such as learning model based on e-learning through Mobile Learning (m-learning) (Sutopo, 2012). Multimedia learning is currently developing a mobile based learning. This phenomenon is changing the paradigm for creating hybrid learning, which brings together the concept of mobile multimedia with a grain-based innovative learning information technology in the form of multimedia mobile learning (Darmawan, 2012). Sport Kinesiology course for learning to attract interest and motivation of learners, the learning innovation is absolutely needed and important.

Researchers conducted preliminary studies related to the subject matter of learning resources Kinesiology form questionnaires at 97 Student of Sport Faculty of Sport Science Universiats Malang are already covered subjects Kinesiology, the difficulty level of mastery of the material, the respondents to respond to 84 people (86.60%) said it was difficult, not the availability of learning resources (87.63%), 88 respondents (84.54%) in need of learning resources. Respondents agreed to do the development of learning resource materials kinesiology form of mobile learning totaled 78 people (81.41%). Preliminary study on educators through questionnaires and interviews, 100% educators states require technology-based learning resources, 100% agree if it will be the development of learning resources and 100% of educators want technology-based learning resources such as mobile learning. Means both learners and educators need to learn source material Kinesiology-based technologies such as mobile learning.

Associated with learning media mobile learning shapes, Sulistyorini, et al. (2009) conducted a study on learning model form of e-learning in secondary schools reported that the results are valid learning model used to study physical fitness and the media developed has the attractiveness and practicality value in learning physical fitness. Roesdiyanto, et al. (2009) conducted research and development on phisical fitness training model form of e-learning for Vocational High School students, the results were reported that media learning proper form of e-learning is used for physical training Fitness.

In connection with the above-mentioned exposure, can expressed that there are problems associated with learning resources are not yet available learning resources nonprinting form of

mobile learning for the material in Student Sport Sport Kinesiology in the Faculty of Sport Sciences. Therefore, alternative solutions are appropriate to solve the problem in learning, namely the importance of research and development of learning resource materials Kinesiology Sport-based technologies such as m-learning form.

Based on the problems that have been described above, researchers have conducted research and development entitled "Development of Learning Resource Material Kinesiology Sport form Mobile Learning for Students of the Faculty of Sport Sciences Sport in East Java".

Goals to be achieved through research and development is "Developing a Learning Resource Material Kinesiology Form Mobile Learning for Students of Sport Faculty of Sport Sciences in East Java" with the product resulting from this research is to create a learning resource nonprinting the material Kinesiology packaged in the form of Mobile Learning furnished with the manual guide the use of mobile learning.

METHOD

Research and development of learning resources using the conceptual model is the development model based on the operationalization of theories or principles that have been validated in the steps or procedures which lead to a product as a form of problem solving (Mukhadis, 2013). Source learning material Kinesiology Sport is packed in interactive media forms of Mobile Learning, the model is used to refer the opinion of Lee & Owens (2004), the development steps as follows: (1) conduct needs assessment or needs analysis (2) Perform front–end analysis or analysis of early and late (3) designing a design or product design. (4) development or product development (5) Implementation or execution. (6) Evaluation or product evaluation.

Research and development of this approach problem oriented because of the issues examined by the actual conditions on the ground (Mukhadis, 2013), meaning that determines the priority of the issues examined by the condition of riel in the field and urges (much needed) to be solved, so that the product can be directly utilized by the user to increase the added value (added value) of a system. The procedure of research and development of interactive media forms of mobile learning conducted by researchers include: (1) the manufacture of initial product, (2) the expert evaluation, (3) Trial product small group, (4)

Revised Product, (5) Field Test (trial large groups), (6) Results, products are tested

Product trials, with regard to the level of accuracy, feasibility, the attractiveness and suitability of the products produced. Design of the tests include the evaluation of experts, the revision of product plans, small group trial, product revision, a large group trial, the revision of the trial results and the large group of final product as the product is tested. Expert evaluation involves an anatomist, Kinesiology, Sport and Media expert learning. Product revision forms of learning resources mobile learning before been tested on a small group.

Small group trial, a learning resource the material form Kinesiology Sport Mobile Learning tested on potential users amounted to 50 people. Product revision of the development of learning resources based on the responses of potential users. Large group trial, conducted at the Faculty of Sport Sciences in East Java, with subjects try totaled 140 people. Revision of the final product, after analysis of the trial results a large group, learning resource material products Kinesiology Sport Mobile Learning revised form so that the product be used as a product that is tested.

Subjects of research include subject experts consisting of experts: anatomy, Kinesiology, Sport and instructional media. Subject target learners Student Faculty of Sport Science Sport East Java represent 140 potential users. Determination of the subject try using random sampling techniques (Baumgartner & Hensley, 2006). The type of data that is generated in the form of quantitative and qualitative data. Type of quantitative data obtained from the recording at the time of the initial study of questionnaires and qualitative data obtained from the review of the experts (Graton & Jones, 2004). Data collection instruments using non-test instruments in the form of questionnaires and interviews (Baumgartner & Hensley, 2006).

Data Analysis Techniques, research and development using quantitative and qualitative descriptive analysis. Qualitative data analysis techniques of data analysis stage includes data reduction, data presentation, and conclusions or data verification. Quantitative descriptive data analysis techniques percentage form.

RESULTS AND DISCUSSION
Results

Data obtained from the respondents amounted to 97 people Students Sport indicator material interest in kinesiology, the majority of respondents chose the alternative answers "less-is not interested" 78.10% (68 of 97 respondents), there is no learning resources (85 = 87, 63% of 97 people). Respondents amounted to 77 people (79.38%) of the 97 states "in dire need" of technology-based

learning resources nonprinting form of mobile e-learning and respondents expressed very helpful learning resources (78 = 80.41%).

Under the conditions of the riel solutions offered by the researcher to the respondents: guests will be the development of the learning resources, respondents who selected "agree" totaling 88 people (90.72%), which states "agree" nonprinting technology-based learning resources in the form of mobile e- learning amounted to 76 people (78.34%), respondents said they would get practical learning resources in the form of mobile e-learning amounted to 85 people (87.63%).

The results of the evaluation and expert validation of the product is designed as a learning resource materials Kinesiology Sport forms of mobile learning is done by an expert on anatomy, kinesiology and expert sports results are derived from 11 indicators outlined in the questionnaire instrument from the aspect of suitability of the material, the accuracy of the material, ease to learn , easy to do, the attractiveness, usability, usefulness, importance, usefulness, depth of content and completeness of the materials criteria for the validity of product to a learning resource response to the results of the expert all indicators have responded dominant choice answers "B and A" for each indicator score obtained 10-12 (maximum score of 12), these results indicate a very valid and can be used without revision (Akbar, 2013).

The results of the evaluation and validation of learning media expert showed that the indicators of fitness for purpose, characteristics of potential users, learning resources, accuracy, ease, the attractiveness, usefulness, efifiensi, media quality, media significance of the result that all the indicators addressed by media experts 100% tiap- each indicator so that the validity criteria showed a very valid (without revision) (Akbar, 2013). Kinesiology means learning resource material form of mobile learning can be used for field testing small groups.

The results of small group trial to potential users amounted to 50 people, the items in the questionnaire amounted to 50 items that have 19 indicators obtained results on the indicator accuracy, pleasure, practicality, ease do, the attractiveness, clarity, difficulty, usability, usefulness, and usefulness, of respondents who the indicator responds at between 32-38 people (64.00% -76%), so that the indicator validity criteria including valid and there is some minor revisions to the material that is designed kinesiology. Suitability indicator, active learning, independence,

effectiveness, practicality, desire, interest, criterion validity showed extremely valid (80% -86% = usable) (Akbar, 2013), an average of 76.95% criterion validity and revision teradap small products. Results minor revisions that have been made, so that the product can be used to test large groups.

The trial results against a large group learning resource material form Kinesiology Sport mobile learning potential users totaled 140 Sport Students have responded to the questionnaire which comprised nine indicators were plated on 50 items of questions obtained an average yield of 88.57% validity criteria include the category of very valid and can be used (Akbar, 2013). Means the results showed the accuracy, suitability, practicality, ease do, the attractiveness, clarity, meaningfulness, and usefulness of products produced learning resources. Relation to learning media in the form of mobile learning indicator of the level of difficulty of use, suitability, active learning, independence, effectiveness, desires, interests, the usefulness of the product, practicality of the product, and the level of efficiency of time, respondents chose the option "disagree-strongly agree berjumah 119 people (85.00%) include the category of very valid and that the product can be used (Akbar, 2013).

Discussion
Discussion Response Division of Anatomists, Kinesiology, Sport and Media Experts to the Product Learning Resource Materials Kinesiology-Based Mobile Learning

The results of the analysis of the data on the instrument which has responded by anatomists, Kinesiology and Sport as respondents, the results of the evaluation and validisasi product to a learning resource response to the results of the expert all indicators have responded predominant answer choice "A" for each indicator score obtained 10-12 (maximum score of 12), these results indicate a very valid and can be used without revision (Akbar, 2013) and results from media experts all indicators responded by expert media 100% of each indicator that shows very valid criterion validity (without revision) (Akbar, 2013), thus meaning a learning resource materials kemesiologi form of mobile learning can be used for prospective users.

Sport Kinesiology source of learning materials are developed based on the results of the analysis have demonstrated the suitability and accuracy, with the validity criteria, including very valid, it means that the learning resources developed have had accuracy and compliance with the material presented. Anitah (2014) bependapat that the selection of learning resources should: (1) adapted to the learning objectives were formulated, (2) customized learning situation, (3) the ease that is a learning resource that is easy to choose and

learn, (4) the flexibility that is a source of learning flexible for use on a variety of subjects and learning objectives, (5) the practicality and simplicity, (6) the ability of educators and (7) economical select learning resources effectively and efficiently.

Abdulhak and Darmawan (2013) says that the learning resources is one important component that can assist in the learning process, namely as a power that can be harnessed for the benefit of the learning process, either directly or indirectly, making it easier for learners to achieve its goals. Use of learning resources is very important, because it will bring students to the mastery of science that is contextual and has a value of meaningfulness high, including the presentation of the new discoveries in the learning that optimize learning resources in learning (Davis, et., al., 2013). Variations in the creation of learning materials will establish communication to connect ideas between educators with learners (Munadi, 2012).

The benefits of learning resources in the learning (Abdulhak & Darmawan, 2013) is (a) provide a learning experience that the concrete is not directly to students, (b) Presenting the impossible is held, visited or seen directly, (c) adding and expanding the horizons of grain that is in the classroom, (d) to provide accurate information and the latest such as: textbooks, sources, and others, (e) to help solve the problems of teaching and learning both within the macro and micro environment, (f) provide motivation positive, all the more when designed penggunannya appropriately, (g) stimulating to think, act and develop further, such as textbooks, reading books, movies and others that contain the power of reasoning that makes the students are stimulated to think, analyze and develop Furthermore.

Learning can be said to be effective if teachers were able to take advantage of resources and instructional media in accordance with the demands of the curriculum imposed on learners (Vernadakis, 2012). It is important to deliver the students to be able to construct his own knowledge, so that students can be motivated to learn secar active, meaningful, and concerned with the whole life skills (Davis, 2013). Significance is determined by the utilization of learning resources and learning media (Akbar, 2013).

In line with these impacts learning resources are attractive, Rusman, et al., (2012) illustrate the theory studied law "practice" and "effect" which states that if a child is interested in what is encountered, then he will be encouraged to increase the intensity of learning

and accompanied by exercises. The results of the implementation of these laws is a potential protege will increase and the achievement of learning outcomes as expected. The impact of the application of that law that spur potential users to further increase the effectiveness study independently with high intensity (Akhmad, 2016).

Learning mobile learning brings benefits availability of teaching materials that can be accessed at any time and visualization of interesting material (Darmawan, 2012). Sutopo (2012) argued that mobile learning is a learning model that utilizes information and communication technology. On the concept of the learning mobile learning brings benefits of the availability of teaching materials that can be accessed at any time and visualization of interesting material.

The application of the theory of learning readiness (Hastie & Martin, 2006) or the readiness to learn is an activity that needs to be done. This is because the readiness associated with the successful adoption of mobile learning, meaning that the application of mobile learning in the learning depends on the readiness of someone facing challenges related to the learning model used educators. If an individual has a specific learning readiness in learning to use mobile learning models, it will increase the willingness and ability to participate in the implementation of learning using learning media mobile learning (Yamasari, 2010).

Darmawan (2012) argues for learning started to focus learning model that is able to facilitate the learners and educators, developing multimedia learning shift toward mobile learning shape and unify the concept of mobile multimedia with the presentation of innovative learning. Some of the advantages of m-learning compared to other study is (Sutopo, 2012) (1) can be used anywhere at any time, (2) most devices move has a price relatively cheaper than the price of a desktop PC, (3) the size of the device small and lighter than a desktop PC, and (4) expected to include more learners as m-Learning utilizing technology that is used in everyday life.

Users Candidate Responses to the Learning Resource Materials Products Kinesiology-Based Mobile Learning Based on Field Test Results

Lack of technology tools used in the classroom learning, as is thought to be one of the causes of weak education in this case the conduct of the learning process in general (Zuchdi, 2009). Therefore, it is important to the development of learning media in the form of a learning resource that is a source of learning materials Sport Kinesiology-based mobile learning. Analysis of the products based learning resources mobile learning results obtained 73.57% and 18.57% stated precisely stated very precise, and 7.86% said less

precise. Judging from the level of urgency and usefulness of products, convenience products, reported a level of efficiency is very high. Judging from the level of difficulty of products 74.29% said it was not difficult, and 25.71% said it was difficult. Means the use of mobile learning media appropriate packing materials Kinesiology and learning resources are not difficult to use, has a value of usefulness and practicality are very high and capable of increasing independence in learning.

Based on the analysis of data from the test group respondents large majority of respondents wanted media interactive learning technology-based media such as e-learning, or mobile learning, the most widely selected by respondents are mobile learning is chosen by 123 votes (87.86%). This may be due to learning by using mobile-learning has advantages for users, such as (Sutopo, 2012): (1) Convencience: users can access from anywhere in the learning content including quizzes, journals, games and more, (2) Collaboration: learning can be done at any time in real time, (3) Portabilty: the use of the book is replaced by RAM with learning that can be arranged, (3) Compatibility: learning is designed for use on mobile devices, (4) Interesting, (5) learning combined with the game will be fun. Model of learning using technology-based media such as mobile learning is a form of intelligent solutions recent learning (Darmawan, 2012).

The concept of learning to use mobile learning to bring the benefits of the availability of teaching materials that can be accessed at any time and visualization of interesting material. It is important to note that not every suitable teaching materials utilizing mobile learning (Abdulhak & Darmawan, 2013). Rusman, dkk. (2012) found based learning mobile learning if designed properly and appropriately, it makes learning more fun, have an element of interactivity is high, learners become more active, independent at a given time, is responsible for learning, and will force students play a more active role that is more in accordance with their will berinisitif respectively. As a result, learners remember more material presented, has a high flexibility, delivery of learning materials may take the form of digital data such as a smartphone or mobile phone. Thus the mobile learning will act as a supplement and complement the learning that makes educators represent a very important source of learning.

Associated with the use of electronic media in learning, Roesdiyanto, et al., (2009) conducted a study on the Model Training and

Learning Physical Fitness-Based Learning, conclusion of the study that the product training model of physical fitness-based Learning appropriate for the training of physical fitness and are not difficult to use, usefulness and practicality value is very high. Sulistyorini, et. al. (2009) has conducted research on "Development of Physical Fitness Instructional Model Secondary School using learning" conclusion of the study that learning to use e-learning is ideal for learning and physical fitness is not difficult to use, the value of the usefulness and practicality are very high. Means the appro-priate use of e-learning in teaching physical fitness and are not difficult to use.

Thus it can be said that the use of information technology-based learning media such as mobile learning is a form of learning that is unique because learners can access learning materials, referrals and applications relating to learning, anytime and anywhere. The impact of the adoption of the media in learning will increase learners' attention on learning materials, making learning becomes pervasive, and can motivate learners lifelong learning (life long learning).

CONCLUSIONS AND SUGGESTIONS
Conclusions

Relative analysis of data obtained from the evaluation experts and the results of testing a large group, the conclusions of the results of research and development are formulated as follows. First, Based on the evaluation and validation of ahi anatomy, Kinesiology, Sport and expert instructional media, conclusion of the study showed that the resulting product accuracy, the attractiveness, convenience, usefulness, practicality, and compatibility with potential users have very high validity criteria. Secondly, Based on the results of a large group trial, conclusion of the study showed that the resulting product accuracy, the attractiveness, convenience, significance, usefulness, practicality, and demonstrate compliance with the characteristics of potential users and not difficult to use has a very high validity criteria.

Suggestions

Based on the results of the evaluation and validation of experts and refers to the results of testing a large group, it can put forward suggestions on the research and development as follows. First, For educators, so that learning can interest and motivation to learn in students, it is advisable nonprinting educators use learning resources that have been tested are packed car shape learning. Second, For Learners to increase the independence of learning, learning effectiveness and efficiency of the time, advised the students to study Kinesiology Sport courses using learning resources nonprinting

mobile learning as a form of tested products. Media mobile learning can be used anytime and anywhere, so it is advisable for learners are able to optimally utilize learning resources and mobile learning media can be used to learn the material Kinesiology efficiently and effectively.

ANALYSIS THE MAPPING OF
THE PRIMARY SCHOOL TEACHERS IN
SRAGEN ERA AUTONOMOUS REGION

Siti Wahyuni; Ahmad Pramudiyanto
Semarang, Indonesia
e-mail: wah_yuni1748@yahoo.com

ABSTRACT

This research was conducted to find out the description and impact mapping needs and competence of educator elementary school in Sragen. In the time of regional autonomy, each district has a special authority one of them in the management of the education system. With regard to this, researchers wanted to examine further on "mapping Analysis of elementary school teachers in Sragen in autonomous region". The research method used was explanatory survey methods with a qualitative approach. The technique of data collection is done with the study of the relevant literature, observation and interviews with informants. The results showed that from the analysis of the mapping generates the effectiveness of mapping the needs of educators in primary schools both in town and in the villages are tailored to the duty hours of teaching and teacher needs each school level as well as equitable certified teachers in the Regency of Sragen. From the results of mapping raises some issues for teachers who are already settled in early and teachers had difficulty in managing the administration of learning. This is because primary school teacher is the teacher of the class. These results can be seen from the results of research that shows the distribution of the number of teachers each school needs every town is different and the barriers experienced by the teachers.

Keywords: mapping, teacher, autonomous region.

Autonomous region is one of the changes from the centralized system that led to decentralized system. Decentralization requires will progress and development in the area which is better based on the potential of the variety as well as one of the policy of decentralization was also autonomous childbirth education (Nurdin & Sibaweh, 2015:23). With the enactment of the autonomy of the respective areas of education are expected to improve the quality of education. In the autonomous regions, each region has a special authority one of them in the management of education Education Management Government pays attention to the aspectsof fair quality, and access to sufficient education. This is in line with the publication of *Peraturan Bersama Menteri Pendidikan Nasional Nomor 05/X/PB/2011, Menteri Negara Pendayagunaan Aparatur Negara dan Reformasi Birokrasi Nomor SPB/03/M.PAN-RB/10/2011, Menteri Dalam Negeri Nomor 48 Tahun 2011, Menteri Keuangan Nomor 158/PMK.01/2011, dan Menteri Agama Nomor 11 Tahun 2011 tentang Penataan dan Pemerataan Guru Pegawai Negeri 421 Sipil.*Promulgation of this rule may be caused by problems and complaints about equity and distribution of teachers.

Autonomy education each area which should be followed by autonomy at any school/educational units. Can be seen in *Undang-Undang Nomor 32 Tahun 2004* gives the same opportunities in each area of operational policies in the management of education became the authority local governments (provinces and district/city), while its operational activities into tasks and responsibilities of each unit of education (Nurdin & Sibaweh, 2015:29). The authority of local government with the purpose of granting of educational services to the community are adequate and without causing a gap so that the achievement of the objectives of education. The problem of the gap covered a wide range of related matters such as quality, facilities, budget funds, the competence of educators, educators, and others.

The gap in education and equalization distribution of teachers requires serious attention. According to Ali (2009) education namely development challenges improving the quality and relevance of including reducing the gap between the quality of education of the region. National education development is faced with two choices of priorities is equalization access and quality improvement at different level of education. In this case equalization educators who have superior competence should be tailored to the needs and problems of education in every school. Further-more according to Nurdin & Sibaweh (2000:30) states that the quality of education include the quality of the output, the quality of the process and the quality of the input. Be aware that the quality of the input sources

include teachers, students, budget, facilities and parents of students who support each other to the achievement of the objectives of education

Associated with improved quality of education, the role of teachers as educators is a very important part in the system of national education. Refer to *UU No. 14 tahun 2005*, teachers have a very strategic role in improving the quality of education through competency. As for the competence of a teacheris determined through expertise and specifications in accordance with the level of education acquired. This is in line with the assumption that the allowance of the profession to the teacher at the elementary school then the Government also demanded that the level of expert in teaching. The teacher is the spearhead of the success of the educational system. Teacher expert is the answer to all the doubts of the community and the Government in giving trust to improve the quality of education (Nurdin &Sibaweh, 2015:180). So teac-hers holders of key in the success of the implemented curri-culum based on strategies in the exercise of learning in every school.

In *Undang-Undang Nomor 14 Tahun 2005* stated that the workload of teachers teaching at least 24 hours and as many 40 hours per week face-to-face. Next*Peraturan Menteri Pendidikan Nasional Nomor 18 Tahun 2007* about certification for teachers in the offeice mandated that teachers who have obtained the certificate of educators, registration number, and have met the work load taught face toface at least 24 hours in one week earn perks of the profession of one times base salary. Not all teachers are in ideal conditions with a load of teaching face to face at least 24 hours per week. Therefore required the addition of hours teaching for teachers in fulfillment of compulsory teaching for a minimum of 24 hoursin one week that teachers who already have a certificate of educators acquire the right is the perks of the profession.

The distribution of a good teacher is able to lower the level of quality of education gaps in rural and in urban areas. This is in line with the opinion Utomo (2013:1) that teacher and equitable arrangement is the mandate of the joint decree 5 Ministers to increase the effectiveness and efficiency of utilization of educational resources as well as reduce the gap the quality of education.Gaps in the quality of education, one of which was caused by the spread of teachers who are less evenly distributed between rural and urban areas.

Based on observations and interview found cause initial mapping elementary school teacher in Sragen. The main trigger was the shortage of certified teachers teaching hours. A teacher can not meet the number of hours of teaching as many as 24 (twenty-four) hours of face to face per week due to one or more of the conditions as follows: 1) the number of learners and groups oflearning too little will cause the number of face to face hours forcertain subjects have yet to reach the figure of 24 hours per week; 2) number of hours of instruction certain subjects in the structure of the curriculum there are only 2 hours per week of other foreign languages, among others, result in teachers who teach these lessons can not meet the obligation to face at least 24 hours every week; 3) the number of teachers in one school for certain subjects too much; 4) schools located in remote areas usually have a number of slightly the learners and Special Schools because of the specificity of the program, number of participants very little his protege. Because groups of learning a little then resulted in a teacher teaching not until 24 hours every week; 5) some teachers complain because by teaching in school that cause differrent mind and more power especially in looking for a school teacher to teach, clocks fulfillment should try it yourself.

Based on the above issues can be deduced how how the description of the mapping exercise of primary school teachers and the impact of the mapping in the era of regional autonomy. So in this study aims to analyze and describe the mapping implementation as well as the impact of the mapping needs of teachers and even distribution of competencies of primary school teachers who are certified in the Sragen district in the era of regional autonomy.

METHOD

This research was conducted in primary schools in Sragen. Research carried out for 5 months starting from May 1999 until September 2016. Research activities include the preparation of research,collection and processing of data, as well as the preparation of research reports. This study used a qualitative approach. According to Sugiono (2013:14) "quali-tative research methods based on the philosophy of postpositivisme, is used to examine the conditions of natural objects, where the researchers as key instruments, sampling the data source are executed purposive and snowbaal, techniques of collecting with the triangular nature of the inductive, data analysis, and the results of the qualitative research emphasizes the meaning of". Inductive in nature qualitative reseachers let

the problems emerging from the data or it is leftopen to interpretation. The data collected with careful observation and analysis of documents and records.

The type of research used in this research is descriptive research.Opinions of Noor (2011:34-35) "a descriptive research is researchthat describeseeks a symptom, events, events that occurred when the now". Descriptive research answers the question what with more detailed explanation in a corresponding researchproblems. Qualitative res earch using the natural environment as a source of data. According to Sugiono (2013:308) "sources of data in qualitative research is a source of primary data and secondary data sources. With the techniques of data collection in the form of observation and documentation. Further analysis of the data used was according to Miles and Huberman performed interactively through a process of data reduction, data display, and verification. The validity of this research data using trianggulation.

RESULTS AND DISCUSSION
Implementation of the mapping of the primary school teachers

Educational reform starting from the bureaucracy of education, curriculum, teacher training and so on the profession. One part ofthe reform of the teaching profession, it is the obligation of teaching 24 hours of teaching. In field observations and conducted interviewa found many teachers, the principal party in the Sragen District Education Office lacking understanding understanding of regulatory compliance burden of teaching. But the 24-hour fulfillment teaching closely related with the profession and benefits national teacher Setup.

Certified teachers who got the perks of the profession one timesbase salary the early enactment of the joint decree five Ministers about structuring and distribu-tion guru 2012 started the confusion looking for extra hours teaching. In accordance with theprovisions of the certified, teachers can get the allowance certification if it meets face-to-face teaching hours at least 24 hours in one week. Before the decree came into force together five certified teachers, Ministers hours teaching face to face less than 24 hours per week could still meet with extra duties outside the classroom, such as extracurricular tutors, guardians and tutors, class packages A, B, and C.

With the Decree along with five Ministers of this teacher's teaching burden, really apply to face-to-face at least 24 hours per week and a maximum of 40 hours per week. As a result, many teacherswho lack teaching hours, if not met, will not automatically benefitcertification. In this case the teac-hers perceived difficulties certain subjects, such as religion, the arts, sports, and the English have two hours in class in one week. It is increasingly difficult to be fulfilled if the groups of learning at school a little bit, especially small private school. So the conditions in some schools became less conducive because the basic division of hours taught do not refer to the provisions of the joint decree five Ministers. The Division is more based on seniority, not performance or competency and accomplishment, the number of teachers certified, while more andmore hours of instruction at the school is limited. Coupled with the number of groups of study of each school that is uneven. Theschool quality are seen superior to have a number of groups ofstudy that exceeds rules that have been set. It happened on a private or State primary school located in urban areas.

Teachers still are not able to meet the work load at least 24 (twenty-four) hours of face to face and up to 40 (forty) hours in one week on face to face educational unit where he was appointed as apermanent teacher, can meet the workload through a system of joint teaching team (team teaching). Team teaching has the principle that in one study group for single subject in the lead by more than one person the teacher. There will be two or three teachers who deal with a one-hour lesson in a groups of study, where one of them teach and pass on the lessons and the other acting as a facilitator or observer.

Through team teaching in addition to the accomodation aspect of his education methods, will also be supervised another aspect to know the level of understanding of pupils. Team teaching can be done by teachers in the same school or by teachers from different schools. Team teaching can be implemented if the demands of the curriculum requires more than one person teacher to handle one groups of learning the lesson that process is a single entity (can not be separated into place). Each teacher in one learning process has the task of each of which is implemented in the same time in a single groups of study.

Teachers still are not able to meet the work load at least 24 (twenty-four) hours of face to face and up to 40 (forty) hours per week on face-to-face educational unit where he was appointed as a permanent teacher, can also be given the task of

carrying out special remedial and enrichment. Special remedial and enrich menthas the principle that the assignment is specifically for one person teacher to a group of learners who require guidance in particular. The teacher who got the task of teaching load of synchronised with 2 hours each week. There are conditions for teachers who are konstektual it is not possible to have a 24 hour teaching load. The conditions in question are as follows: 1) served on special education services unit; 2 special ex-perts); 3) required on the basis of consideration of the national interest.

The fulfillment of these minimum teaching hours should be evidenced in the real or physical evidence such as the schedule of tasks and Division of Administration should be done by the teacher each semester. For teachers who are subjects, the school is obligated to perform the optimization of structuring and equitable teaching load of teachers. If there are still teachers who have not been able to meet the burden of teaching face to face at least 24 hours per week, the fulfillment of the burden of teaching learning activities performed through equivalence/supervision. But many teachers especially old teachers have difficulties in terms of administration reporting the fulfillment of teaching hours.

Equivalence of the learning activities/ supervision) recognized at most 25% of the burden of teaching teachers or 6 hours per week face-to-face as evidenced by the physical evidence. Physical evidence of equivalence of learning activities in pursuit of the form/ photocopying/ copy that legalized by the principal and presented to the education service districts/cities/provinces in accordance with those powers to be verified. Further education service reported the results of verification to a related Directorate handles the teachers as the basis of the publication of the Decision Benefits the profession. However, for homeroom and teacher picket could breathe a sigh of relief, because their work is appreciated, in contrast to his previous homeroom and teacher picket do not count hours. To homeroom calculated 1 hour lesson for one classper year. While for teachers picket calculated 1 hour lesson for one time in a week.

Positive Impact

The obligation to teach 24 hours of face-to-face teaching per week is said to be positive because the task of the teacher is to be effective in the school adapted to the allowance has been granted. It is tailored

to the purpose of structuring and equitable teacher of civil servants to improve the quality of education through the provision of teachers in the long term completely. Certified educators. Teachers who are certified educators expected to become professsional teachers.

Teacher professional development is the key to quality education. On the one hand, the Central Government's interest against the success of Equalization and structuring of teachers because it will suppress the teacher needs civil servants. If the PPG works, where the teacher is no longer concentrated in particular schools and distribution evenly in all schools, this will reduce the number of national teacher's needs.The decline in the number of national teacher's needs will in turn suppress national budget allocation to finance shopping teachers in the form of salary, allowances, and so on.

Negative Impact

On the other hand the Division confuse the principal teaching hours. Will ultimately create problems in junior teachers or honorary teacher. In a joint Decree Five Ministers, a teacher of civil servants who lack teaching hours are only allowed to cover the shortfall with its teaching in public schools only. But all along, manyteachers are civil servants who cover the shortage of hours teaching with teaching in private schools is poor, around their tasks without being paid. This provision eliminates the rights of poor children to acquire learning from teachers who are already certified. In this case there is a dichotomy between State school students and private school students.

Teachers who acquire another school as a place to add to the number of hours of face to face, meaning a teacher must teach in some places. It certainly takes time, cost, and more power, so it is not efficient. This causes the teacher to be less concentration in teaching and as a result the learners be not optimal in the lesson.In addition, time is not an effective way to teach at other schools would result in teachers do not have sufficient time to read, write, draw up implementation plans, Learning and improvement of professiona-lism. Thus, it can be assumed that the regulation together with 5 (five) Minister of neglecting quality improve-ment efforts and burden the teachers.

CONCLUSION

Fulfillment of obligations taught for 24 hours in one week of face to face is a consequence that must be carried out by a teacher to obtain allowances of teachers. Fulfillment of obligations 24 hoursmay be a solution of the equitable distribution of teachers. This

step is also performed as an attempt to keep it from happening between teachers teaching hours inequality in one school and the other schools. In addition to anticipate not maximum empowerment teacher, then the necessary calculations and mapping teachers in each district/ city with better.

Successful implementation of teacher workload fulfillment relies heavily on understanding, awareness, involvement and an earnest effort from all their associated elements, as well as Governmentand community support. Successful implementation of the fulfillment of the workload of teachers has also become a real hope for the development of education, teacher professional development that is able to produce a decent intelligent Indonesia in a fair and competitive, quality, and relevant to the needs of the global community and Indonesia.

The spread of uneven teacher raises the occurrence of inefficient utilization of teachers in some places. Teachers who do not meet the obligations of the 24-hour face-to-face teaching per week recommended for mutation/transfer to another school the teachershortage. The arrangement of the transfer of teachres following the policies of the respective local government through the Department of education. Should the fulfillment of hours taught by teachers who lack teaching hours are set by the local education Office, so that the teacher is not confusion in finding the school shortage of teachers in teaching.

PARENTING PARENTS AND SELF-STUDY CHILDREN AGES 6 YEAR IN EDUCATION EARLY CHILDHOOD SANDAT KUNING MATARAM

Siti Zaenab

STAHN Gde PudjaMataram, Indonesia

e-mail: sita.zaenab99@gmail.com

ABSTRACT

The artikle a pattern Foster parents toward self-learning children aged 6 years, the likelihood of children applying simple learning of independence. This pattern has been developed on the basis of relevant theories, and initial implementation in early childhood education, Reef Environmental Madain Mataram. This pattern is developed based on the four steps in the cycle of child's independence: heredity, upbringing, physical condition, the order of birth. This preliminary study is intended to determine the feasibility, practicality and ability independence from parenting to be applied in early childhood education settings. Based on preliminary findings, early childhood parenting will be established based on the condition of the parents was at home. This pattern will provide a valuable contribution to the education of people host in their homes to maintain and improve parenting in improving the quality of education of parents, and therefore can provide quality service to children.

Keywords: parenting, early childhood, parents

Having children independent, tough and brave is the dream of every parent. The duties and responsibilities of parents a family towards their children's education is more the formation of character and manners, social skills training and education, such as helping, jointly keeping the house clean, maintain good health and peace of the household and the like. In the framework of the implementation of national education, the role of ancestry as educational institutions increasingly visible and important.

The role of the family, especially in the cultivation of attitudes and values development of talents and interests and fostering talent and personality. In connection with the planting of Pancasila values, religious values and the values of trust in the Almighty God begins in the family.

Based on the above opinion is clear that the role of education in the family and community is very important, because through education will determine a child's character and his future and as a parent who is a teacher first and foremost for the child then the child will learn life and through parents nor children learn will develop all aspects of his own for the parents play a role in guiding and motivating children to develop themselves, especially when the child is 6 years old.

From the observations of researchers Thursday, 11 February 2016 that the ECD Integrated Environmental Sandat Kuning located in Medain Karang Barat, Mataram West Village, District Selaparang Mataram, West Nusa Tenggara Province. The distance to the center of districts ± 500 m and the distance to the city center ± 500 m. Beginning naming Sandat Yellow organization called early childhood, because the needs and desires of the parents of students, the institution changed its name to Integrated ECD Sandat Kuning. Under the auspices of ECD then the institution has a container Kindergarten (TK) and play group (KB) so that people around the reef medain west and its surroundings can leave their children with a sense of security, comfortable and has activities in the learning process in accordance with the child's age early.

Integrated ECD was established on June 1, 2012 which was pioneered by the Chief of Integrated Early Childhood Sandat Kuning (Ni Luh Putu Arini) on their motivation to establish early childhood education institutions in the reef environment medain. Beginning of Education established an environment of coral medain West because of an observation and observation about the absence of the container body to foster and nurture early childhood due to some environmental factors that will have an impact that is not good for the personality and character of early childhood. Of the impacts that such as gambling, drinking drugs and juvenile delinquency resulted in moral and ethical child no more, because that arise an idea or desire of the head of ECD Integrated Sandat Kuning to change environmental conditions better by setting up a early childhood education institutions. Thus early age children were saved from routine or environment with a variety of activities in early childhood education institutions.

Early childhood is a part of a child in the age range of birth to 6 years. At this age the terminology referred to as pre-school age children.

Aged 6 years is a sensitive period for the child, the child begins to receive bebagai sensitive development efforts throughout the children's potential. Sensitive period is a period in which the maturation of the functions of the physical and psychological ready to respond to the stimulation provided by the environment, this period is a time to lay the first foundation in developing physical abilities, cognitive, social, emotional, self-concept, self-discipline, self-reliance, art and values religious values. Therefore, in need of stimulation conditions and in accordance with the needs of the child to the growth and development of children achieved optimally.

The role of children in independent study, especially parents is in need in developing the potential of children 6 years mainly in children's language development. Development efforts should be made to play while learning activities or learning while playing. By playing the child has the opportunity to explore fun. Besides playing helps children to know themselves, other people and environmental.

METHODS

The study design is based on research problems. In this study, using the phenomenological qualitative descriptive approach. The approach begins with inductive and deductive thinking. Conclusions are drawn based on empirical data. While more research attention directed at the establishment of a substantive theory based on concepts arising from empirical data that will be later findings. So that qualitative research is research that produces descriptive data in the form of words written or spoken of people and behaviors that can be observed (Margono, 2003).

The location of research in early childhood which is in the Sandat Kuning Environmental West Karang Medain, Mataram West Village, District Selaparang Mataram, West Nusa Tenggara. In qualitative research, the researcher's presence acts as well as a data collection instrument.

Related to this research, then as a primary data source (primary) is the data prepared in the form of words and actions of those who observed or interviewed (the object of study) are then recorded through the notes, through a video recorder / audio tape, shooting (photos). Event data collection is a very important part in a research however does not mean that the other part is less important even in qualitative research, collection and analysis of data carried stimulant. The point is that while collecting the data, researcher and perform data analysis in this context the role of the researcher as a

manager investigators also as the only instrument. In this study the form of the interview was used directionally or free guided interview is an interview conducted freely, but can not be separated from the main issues that will be asked. In this study, interviews were conducted with head of early childhood, early childhood teachers, and parents of early childhood Sandat Kuning Mataram. In the analysis of data to be checked according to the type of data processing used in the respective issue then concluded for the whole problem under study (Faisal, 2001).

The collected data is then performed distinctions, where distinctions are meant to categorize the type of data collected, before the data is input into the research. In this study, data processing method used is descriptive method, which is a way of analysis or processing of data by way of systematically compiled in the form of words or sentences and eventually obtained a general conclusion. In qualitative research, the research conducted by three techniques: 1) data reduction, 2) Presentation of data, 3) inference of data (Sugiono, 2007: 89). Related to this research analysis conducted by three of the process considering this study used a qualitative approach.

The validity of the data is intended to obtain a level of trust with regard to how far the research results reveal the truth and clarify the data with actual facts on the ground. For the data obtained by researchers credible and justified scientifically, the research to check the validity of the data by maintaining credibility, transferability, dependability and confirmability.

RESULT AND DISCUSSION

The first study conducted by Rian Taruna in the thesis titled "The Role of Parents in Early Childhood Education". The result of this research is the role of education in the family and community is very important, because through education will determine a child's character and his future, form the character and manners, skills training and education kesosialan. The role of the family, especially in the cultivation of attitudes and values development of talents and interests and fostering talent and personality (Rian Taruna, 2010. The relevance of the research to be conducted by the researchers is related to the parents' parenting role in the social development of children aged 6 years.

The concept is the raw material of a study that will be in surgery in each of the buildings, the theory most fundamental conceptual level that includes definitions, conceptual analysis, and a statement confirming the presence of symptoms empirically shown in the statement of intent Suprayogo and Tobroni, (2001), The concept can also be used to understand everything that is distinctive that already exist in a which has been

expressed so openly can be observed with the naked eye carefully (Wuisman, 1996).

In connection with the above concepts are included in this study are as follows:

Pattern foster parent is a pattern of behavior that apply to children and are consistent from time to time. This pattern of behavior can be perceived by the child, in terms of negative and positive. According to Edwards, 2006 stated that parenting is the interaction between children and parents to educate, guide and discipline and protecting the child to reach maturity in accordance with the norms that exist in society.

Parents are the father and mother of a child, either through biological and social relationships. Generally, parents have a very important role in raising children, and call mom and dad can be given to women or men who are not the biological parents (biological) from a person who fills this role. According to Thamrin Nasution parents are each responsible person in a family or household tasks in everyday life called the father and mother. While Hurlock reveals parents are adults who bring children to adults, especially in the development phase.

In more detail can be described the importance of the role of parents for children's education, among others: (a) Parents are the first and main teacher for children. Through parents, children learn life through parents and children learn to develop all aspects of his personality. (b) Parents are the main protector of the child, (c) Parents are the source of life for children, (d) Parents are dependent upon the child, (e) Parents are a source of happiness for the children.

In addition parents have some role in educating children, among others: (a) Maintain physical health checkers child's mental, (b) Laying the foundation of a good personality (c) To lead and motivate children to develop themselves (d) Provide adequate facilities for development child. (e) Creating an atmosphere that is safe, comfortable and conducive to the development of children.

According Padil (2010) social development of children is a pattern of behavior, according to the theory of symbolic interactionism, human action is based on three things: (1) Humans act towards one based on the meanings that exist on something for them. (2) The meaning is derived from a person's social interaction with others. (3) The meanings of refined during the process of social interaction takes place.

The factors affecting the social development of children, among others:

1) The structure of the socio-cultural patterns of behavior that is expected Idial.
2) Factors that situation all the physical and social conditions which were and are applied in accordance with the social system.
3) The factors of personality that is all psychological and biological factors that influence the behavior of individual actors.

The process of social development of children through two ways: a) the process of social learning, which means learning to understand and know about the behavior and actions of the community through social interaction. b) The process of formation of social loyalty.

Program in Early Childhood Education is education that determines the formation of the child's personality. The process of early childhood education occurred since the child in the womb, infancy up to children aged less than eight years. Education is provided through the provision of educational stimulation to help the development and growth of both physical and spiritual.

Early childhood is a child whose age has not entered a formal educational institutions such as elementary school (SD) and usually they stay at home or follow the activities in the form of various educational institutions of pre-school, such as playgroup, nursery or garden childcare. Early childhood is children aged 0-8 years. While essentially an early age children (Augusta, 2012) is a unique individual, where he has a pattern of growth and development in the physical, cognitive, social, emotional, creativity, language and communication in particular that according to the stages that are traversed by the child. And various studies have concluded that early childhood is children aged 0-8 years who are in a stage of growth and development, both physically and mentally.

The period of early childhood is often called the "golden age" or a golden period. At this time nearly all potential child has sensitive period to grow and develop properly and terrific. The development of each child is not the same because every individual has different developments. The food is nutritionally balanced and intense stimulation is very important for proper growth and development of the. If the child is given stimulation or good nutrition, the process pertumbukan and child development will occur either.

The ideal and good education should be done since children birth through adolescence to be returned to nature or natural approach. If a child can be one with nature will he be happy and will grow curiosity. Children should be able to develop naturally without a hitch. Parents must provide freedom in accordance with his talent. In the opinion of Marun Lauther (1483-1546) family is the most important institution for the education of

children. Lauther encourages parents to guide children in religious education from home. Meanwhile, according to Ki Hajar Dewantara education unbiased cultivation of character value, artistic value, cultural value, intelligence, skill and religion. Among the system is how to approach, or educational methods most appropriate to do in Indonesia, even said "Education is the servant of the child", this proves that education should serve and give freedom to the child to be happy.

Independent Learning good learning is familiar with the various concepts through the child's own experiences, among others: through counting, measuring, taste, and touch or touch. All that can be obtained if from an early age are taught in trouble, both heavy and relatively light. Habits spoiled an attitude that should be removed so that they can solve their own problems without help from others. One way to develop self-sufficiency in children is to introduce value activities adventure. Mother possessed the greatest responsibility in educating children. The most important principle is to learn through play Zaenab (2015). Early childhood education programs are considered important include.

The theory of social development to support social research is tori children used in the field of philosophy and sociology of human development. If in educational psychology discussed about human development from the psychological side, then in the sociology of education discussed about human development in terms of sociological. According to Abu Ahmadi theory of social development processes are categorized into: 1) Theory of nativism. Nativism theory says that humans will evolve like what it is heavily dependent on nature; 2) Theory of Empiricism. The theory of empiricism says the development of the child is influenced by environmental factors, while the carriage had no effect; 3) The theory of convergence. This theory said that human development depends on two factors: innate factors and environmental factors or school.

Thus the theory of the above contribute to the upbringing of parents and independent learning of children aged 6 years on early childhood care and Sandat Kuning Mataram.

CONCLUSION

From the results above it can be concluded that parenting parents with children in early childhood learning independence in the social development of children 6 years of age is necessary so that the child can get along with peers and explore talents or capabilities. Child learning independence will give a guidance

which is based on parenting and child development. Social development of children is the learning process of individuals to behave in accordance with the standards contained in the culture of the community. But in reality the role of parents in their children's social development, especially independent learning for young children are age 6 years to the development potential of children is lacking. This can be seen when children get along with their peers is still very limited by the parents so that the socialization process is individual study habits, attitudes, ideas, patterns of values and behavior with a standard of behavior in which he lived is still lacking which would give effect positively to the growth and development for children.

DEVELOPING LIFE SKILLS THROUGH
PRIMARY SCHOOL STUDENTS LEARNING PROJECT
BASED MATH

Sri Harmini

State University of Malang

E-mail: sri.harmini.fip@um.ac.id

ABSTRACT

Life skills are skills that one has to dare to face life's problems with reasonable without feeling pressured, so someone will proactively and creatively search as well as finding solutions to overcome the problems that it faces. Life skills are classified into two skills, namely life skills in general, namely self-awareness (personal skills); rational thinking skills (thinking skills); social skills (social skills); and life skills in particular, the intellectual faculties (the academic skills); social skills (vocational skills). Life Skills can be developed early start at primary school age. Curriculum SD 2013 signaled learning in school refers to the active learning centered on the student. Based on of the gesture learning in schools should be directed to the scientific approach. One of the learning which refers to the scientific approach, the project-based learning that is adapted to the character thinking of elementary school students. Elementary students are at the age of 7-12 years have a level of concrete operational thinking. At the age of elementary school students still have the ability to think holistically to address a problem. In connection with the character of elementary school students in teaching mathematics abstract should be adjusted to think students. One of the subjects that facilitate the development of life skills that mathematics learning materials. Mathematics as a basic science which cover all the science associated with abstract ideas are arranged in hierarchical and using deductive reasoning / logic. Learning mathematics in elementary school must be adapted to the character of students as learning subjects. This can be done by implementing a Project-Based Learning Mathematics. Packaging of project-based math learning step, starting from determining essential fundamental questions or inquiries; design planning activities (project); draw up a schedule of activities, monitor the progress of activities; test the process and learning outcomes; evaluate the experience of implementing the activities (projects). Armed with strive math skills students are able to develop their creativity so that they can develop life skills.

Keywords: life skills, project based learning, mathematics, elementary school

Law No. 20 Year 2003 on National Education System (USPN) suggests an increase in the quality of education nationwide. Improving the quality of education related to improving the quality of the Indonesian people fully inter alia through olahhati, olahpikir in order to compete. In accordance with USPN is explained that education is a conscious and deliberate effort to create an atmosphere of learning and the learning process so that learners can actively develop the potential for him to have the spiritual power of religion, self-control, personality, intelligence, noble morality, skills needed him, society, nation and state. Thus the purpose of education is to help students to be later able to improve and develop himself as an independent person, as a society and as citizens (Dawn, AM.2008 / http: //www.mbs-sd.org/isi.php? id. = 82).

Efforts to improve the quality of education has been carried out thoroughly covers aspects of knowledge, skills, attitudes and values. This was carried out from higher education to the most basic levels of education, namely primary school. The concept of education led to the establishment of the Indonesian people in the future to bring the

determination of the basic learning needs in schools. One of the concepts related to learning basic skills is a basic (basic skills), the ability of the minimum that must be owned by the students to continue to develop themselves. There are three elements ("3 Rs), namely reading, Writings, and arithmetics, is a set of basic skills that should be mastered by students. All three of these elements support the implementation of basic learning. Learning basic includes six components: reading, writing, and arithmetic (mathematics), as well as cultural information (either in Indonesian language, science, social studies), English, and Computer (Sonhaji, A.2013: case 100). The development of these aspects strived to improve and develop life skills, through a set of competencies that must be achieved by students in order to survive, adapt, and succeed in the future.

Mathematics as one lesson in elementary school is inseparable from the concept of basic learning in education and improving the quality of the education. For the application of mathematics learning need to be reviewed / improved / adapted to the rules of education and training. In order for the learning of mathematics has value and results to fit the needs of students, the learning must be pursued on learning that leads to the fulfillment of

the needs of students in the future. Learning mathematics meant that learning life skills through project-based learning. Thus the teacher in teaching mathematics should adjust the characteristics of the material (content) of subjects, with mathematics learning approach in accordance with the level of thinking, student characteristics and needs of students in the future. Elementary school students are still in the stage of concrete thought to have characters like to play, like manipulating concrete objects to get / find something. Thus the stage of thinking that needs to be used for membelajarkan math teachers effectively, by implementing learning refers to the development of life skills.

Observations in several areas obtained information that students have not been able to plunge school graduates in the community to the fullest, because they are less skilled and creative in solving problems in everyday life. For example, students can not calculate or determine the outcome of the calculation math quickly and accurately, so that it can inhibit the settlement of problems faced by students in the community or the world of work. This is due to the level of student mastery in mathematics inadequate. For the mathematical skills of students ranging from elementary school needs to be improved early. This can be done by applying mathematics learning in creative and innovative through project-based learning. dimilik that skill proficiency students can support later life.

Less successful students in learning mathematics due to several factors that are common, namely psychological factors, physiological factors, paedagogik factors, environmental factors schools, facilities and infrastructure factors mathematics in elementary school. The lack of props, curriculum demands which must be met by teachers to be a target of achieving appropriate curriculum, the learning of mathematics in primary schools tend to be monotonous. Learning only lead to the complete absence of material without seeing the process of achieving this, so that the nature of elementary school students develop good universal interest, intellectual, physical, emotional, and social development is not realized by teachers and tend to be ignored. Besides, in general mathematics is still centered on the teacher. Learning Math is not associated with the formation of life skills students need to have in the community. After graduating students passive and often experience difficulties mainly in difficulty in solving problems in everyday life.

Based on the description above, the discussion in this paper is focused on the development of life skills through creative and innovative math learning project based at the Primary School. The Objectives The discussion in this paper aimed at giving empirical overview of how to develop life skills through project-based learning math in elementary school.

DISCUSSION
The Concept Of Life Skills

According to WHO (1997) defined life skills as the skills or the ability to be adaptable and positive behavior that enable a person is able to face the demands and challenges of life more effectively. Barrie Hopson and Scally, argued that life skills are developing themselves to survive, grow and develop the ability to communicate and relate either Individui, groups and through the system in a given situation. According to Brolin (in Puskur, MONE ,. Puskur, 2008: 4) life skills is the interaction of various knowledge and skills so that one is able to live independently. Life skills does not merely have a certain ability, but also has the ability to support basic functional. For example: reading, writing, arithmetic, formulate and solve problems, manage resources, working in groups, and using technology.

Development of life skills in question here emphasizes the following aspects: (1) Relevant skill to master learners, (2) the subject matter in accordance with the level of development of learners, (3) the learning activities and the activities of students directed to the achievement of competencies, (4) facilities, tools and adequate learning resources, and (5) capabilities that can be applied in the lives of learners. Life Skills has a very broad meaning if the learning activities designed to give a positive impact on learners in helping to solve the problems of life, as well as overcoming the problems of life and life is faced proactively and reactive in order to find a solution of problems. Those aspects of the above boils down to an increase in the development of life skills which is realized through the achievement of competency to be achieved by students in order to survive. Activities are integrated on existing learning. So no need to allocate separate time. Life Skills are grouped into two types: generic life skills (generic life skills / GLS), and specific life skills (specific life skills / SLS). Generic life skills, include: personal skills (personal skills), and social skills (social skills). Personal skills include proficiency will self-awareness or understanding of self (self awareness) and thinking skills (thinking skills), while social skills include communication skills (communication skills) and proficiency in collaboration (collaboration skills). As for specific skills, skills related to the job or face certain

circumstances, which include academic skills (academic skill) or intellectual prowess, as well as vocational skills.

The academic skills development should be adjusted to the level of student thinking and education. Implementation of life skills education integrated with existing lesson in all types and levels of education, not least in mathematics. The principle of learning leads to learning life skills contextually, namely the relationship between real-life environment and experiences of students.

Steps that can be taken in describing the life skills that are integrated into the course from, among others: (a) identifying the elements of life skills that are developed in real life and can be developed in the form of learning activities; (B) identify the knowledge, skills, attitudes, and values that support the life skills; (C) classify in the form of topic / theme of the course from the corresponding mathematical life skills; (D) determine the methods of learning; and (e) designing the shape and type of assessment (Puskur Research and Education Ministry. 2008).

Characteristics Of Primary School Students In Learning Mathematics

As stated by Jean Piaget, the level of development of human thought includes four stages, namely the age of 0-2 years of sensory motor stage; 2-6 years of pre-operational stage; 7-12 years the concrete operational stage; and over 12 years at formal abstraction / abstract. Elementary school students who have aged 7-12 years are in the concrete operational stage (Kostelnik. 1993: 122-128). In this concrete operational stage, elementary students begin to think mathematically logical.

Phase thinking begins by manipulating concrete objects in solving its problems. It is characterized by the ability of understanding of numbers, matching, selecting, classifying, identifying and understanding the concept of sets, comparing two groups of objects, understanding parts of a whole, drawing, graphics, measure, make a pattern, estimating, generalizing simple. While skills can be developed in the concrete operational stage is for students to cultivate the initiative to move in the study, including focus skills (focusing skills); sorting skills information (information gathering skills); analyzing skills (analyzing skills); generalize skills (generating skills); recall skills (remembering skills); organizational skills (organizing skills); integrating skills (integrating skills); assess skills (evaluating skills); At the age of

elementary school students still have the ability to think holistically to address a problem

How to develop your life skills for students?

One effort to develop life skills, begun thinking. Thinking can be defined as a process of using the mind to find meaning and understanding of things, estimate the various possible ideas or creations and make a reasonable judgment, in order to make decisions and solve problems and so make the process of reflection and metacognition experienced (Mustadji.2013)Thinking is an activity focused on the exploration of ideas, provide a wide range of possibilities and are looking for more answers correct.

In relation to the learning context, in the classroom, the development of thinking skills includes four things: 1) the ability to analyze; 2) learning students on how to understand the statement; 3) follow and create a logical argument; 4) eliminating the wrong track and focus on the right track (Haris in Mustadji. 2013). Thinking in learning activities include critical and creative thinking.

Critical thinking is meant here is the ability to organize, systematize, interpret, and the settlement of a problem mainly related to several variables or the relationship of the various problems it faces (Hudoyo: 1979) Examples of critical thinking skills, for example: compare and contrast; creating categories; examining small parts and the whole; explain the reasons; made to order; determine the source believed, and make predictions.

Characteristics of critical thinking someone has the following capabilities: analytical; convergent thinking, vertical thinking, estimate the various possibilities; make decision; think the focus; has a purpose; able to answer; using the left brain; express something verbally; think in a linear manner; think about the influence of a problem. Creative thinking is to think consistently and continuously produce something creative / original as appropriate.

Indicators of creative thinking is characterized by the ability curious; looking for trouble; enjoy the challenge; optimistic; able to distinguish assessment; comfortable with imagination; see the problem as an opportunity; see the problem as a matter of interest; problems can be accepted emotionally; challenging the assumption / presumption; and do not easily give up and tried hard. The results of creative thinking the accomplishment of a person's creativity, which is characterized by an ability, behavior and processes.

Thus the so-called creativity can be expressed as: An ability to think and find new ones, creating new ideas by combining, changing or reapplying existing ideas; A behavioral accept change and newness, the ability to play around with various

ideas and possibilities, flexible outlook and habits enjoy something; A continuous process of hard work and in generating ideas and solving problems better, and always tried to make things better. In connection with the character of elementary school students in teaching mathematics abstract should be adjusted to the level of student thinking of concrete operational thinking stage leads to the stage of formal thinking, then the elementary students need to be trained to think critically early.

Teachers 'efforts to build, enhance and develop students' creativity needs to be done with the creation of a conducive learning environment that supports student creativity, the learning environment that directly provide opportunities for us to think critically and openly and flexibly without any sense of shame and fear. A conducive environment that facilitates and enables the process of learning. In order to build critical thinking skills and creativity of students, teachers need learning students by involving various mathematical concepts in an integrated manner. Learning that involves many mathematical concepts can be done through project-based learning in math problem solving.

Project Based Learning

There is some understanding of Project Based Learning, among others: Project-based learning is an instructional model that calls for curriculum content standards; Project-based learning is an instructional model that demands the ability of teachers and students to develop guiding questions (a guiding question). Project-based learning is an instructional model that requires students to be able to make the connections / bridges that connect the various subject matter / concept and conduct in-depth investigation of a topic in a concrete way.

Project-based learning is an instructional model that takes into account the students in the exploration, appraisal, interpretation, and syntesys information through a meaningful way. Thus, learning is a project-based learning model that involves centralizing meaningful questions and problems, problem solving, decision-making, the process of searching multiple sources, giving students the opportunity to collaborate with the group, and presented the results of the work in practice. Project Based Learning thus not simply join the new theoretical and practical information, but to motivate the students to reflect on something that has been studied so as to improve scientific performance of the students. Project Based Learning and Curriculum for

Primary Schools 2013. According to the curriculum in 2013 (Kemendikbud, 2013: 137) the implementation of a scientific approach includes activities to question, reason, try (to prove), concluded, and communicating can be done through Project Based Learning. The characteristics of the Project Based Learning (Widyantini, 2014: 5) includes: (a) any problems or complex challenge posed to students; (b) students design the process of solving problems or challenges posed by using a probe; (c) students learn and apply the skills and knowledge he has in various contexts while working on a project (activity); and (d) students work in cooperative groups in addition to discussions with the teacher.Students practice a variety of skills needed in life and their careers.

Project Based Learning Mathematics in Primary

Competency Standards Math lesson SD mention that the math works to develop the ability to reason through investigation, exploration, and experimentation as a means of solving problems through logic and mathematical models, as well as a means of communication through symbols, tables, graphs, diagrams to explain the idea. The purpose of learning mathematics is to train and grow the way of thinking in a systematic, logical, critical, creative, and consistent, as well as develop a persistent attitude and confidence in solving problems. In order to achieve the expected competencies, it is necessary to create a conducive learning climate mathematics to enable students to learn through project-based learning. Numeracy skills, especially operations on numbers count as one of the competencies that should be completely mastered elementary, before reaching a broader competence. For the numeracy skills of elementary school students should be improved. Mathematics as a science that is abstract is axiomatic composed of abstract ideas using symbols with strong deductive reasoning. Capabilities that can be developed through the study of mathematics in general include: Thinking abstract, logical thinking, systematic thinking, critical thinking, analytic thinking, reasoning (argued), manipulate tools, find a relationship, find the pattern / regularity, set the formula as appropriate, using the formula, validating the formula, finding alternative solutions to problems. It is specifically related to material subjects in school, the numbers / arithmetic, geometry, algebra, and statistics.

Knowledge of mathematics includes knowledge of conceptual and procedural knowledge. Conceptual Knowledge refers to the understanding of the concept, while procedural knowledge refers to an algorithm or skills to do the work procedures (Hiebert and Lefevre in Sutawidjaja, 1997: 177). That is, the basic concepts of mathematics should be well understood by the

students, so that students skilled and capable in solving problems broader finally arrive at solutions to problems. For understanding the concept, teachers need membelajarkan be varied, while the advanced skills necessary to create an exercise routine and repetitive, or it can also be accompanied by a game to make it more attractive. In order for the planting of a mathematical concept (idea) into the schemata students can be more meaningful and can construct a mathematical concept, it would require an environment that allows the processing of assimilation and or accommodation on a mathematical concept, thereby building a network concept based on schemata that have of the students (Hudoyo, 1998). Thus requires the involvement of students intellectually, socially and emotionally. by utilizing the objects around students who can be manipulated. There are four ways of presenting mathematics, namely: (1) the presentation of real form (concrete), (2) the presentation of the form of images (semi concrete), (3) the presentation of the form of diagrams (semi abstract), and (4) the presentation of the form of symbols (abstract) , Learning math is basically a process of assimilating and accommodating (connect) the experience or the material to be examined with the understanding that has been owned by someone, so that understanding can be developed (Suparno: 1997). The study of implicit understanding the characteristics of learning, namely: (1) construct meaning; (2) construct, meaning a continuous process; (3) learn not merely to gather facts, but rather a development of thought to create a new sense; (4) the learning process actually occurs when a person schemata in doubt stimulate further thought; (5) learning outcomes are influenced by the experience of learners with the physical world and the environment; (6) the learning outcomes of someone depending on what is already known by the learner, either about the concepts, goals, and motivations that affect the interaction with the material being studied. Learning mathematics requires an effective approach, in which teachers should be able to create an atmosphere conducive learning, constructive, creative, and innovative.

Mathematics can not be taught in elementary school successfully, unless the content (material) and the way they are presented adjusted to the level of development of student thinking. Developments think elementary school students who are in the concrete operational stage requires active experience in manipulating objects or concrete and semi-concrete images in understanding abstract math concepts. For the content / materials are taught to be of material that is easy / simple heading to a material that is difficult / complex, accompanied by the use of concrete objects as props that can be manipulated by siswa.Disamping it, so that the learning of mathematics in schools can be meaningful for students who learning, mathematics learning should be created in accordance with the elementary students and the world according to skills developed.

Learning Mathematics in Elementary School are commonly carried out in the classroom, most only require procedural capabilities of the students, so that learning tends to be centered on the teacher. Students are regarded as empty boxes that need to be filled in the subject matter. Teachers forget that each individual who learns each have a potential that should be developed in a creative and meaningful for students as subjects of education. Mathematics is considered a finished goods ready to be transferred to the students' minds. While each student has different abilities to absorb the lessons. Mathematics learning activities in the classroom can actually be broken down into three stages: planting concepts, understanding of concepts, and coaching skills (Estiningsih E in Supinah, 1998: 4). The expected goals in math-based learning project is to enhance the power of creation and activity of students in solving problems, creating the ability to interact more intensively fellow students. In addition math project-based learning aims to improve the ability of students to understand the concept more deeply and to improve students' ability to think critically.

Besides, it is expected that students were able to construct his own knowledge, especially in terms of understanding the operation on numbers count, count, measure, and solve problems. To understand the mathematical concepts requires a process, both assimilation and accommodation. Creative and innovative learning process in question is a learning process that allows the student is able to manipulate tools, perform a simple experiment, explore, investigate, discover what has been learned so that students have a very meaningful experience, particularly related to the development of life skills in the future. Thus, students are learning to count, learning should not just mechanistically apply the calculation of numbers and wake up alone, but must be able to interpret the information obtained from the calculation. For example: someone who works in welders exposed to problem-solving that is made of iron, carved doors. So that the iron bars that will be made in size according to customer demand and without having an iron unused, the person must have the skills dividing line appropriately. Coaching skills is what allows the teacher as a teacher can direct the learning to the development of life skills. Therefore learning mathematics

contextual and realistic, and based problems become very important, especially in giving the meaning of what has been learned in everyday life.

One example of Project-Based Learning Mathematics in order to develop the life skills students as follows: Students are given the task of preparing the action plan separation sixth grade students in the school. In the event that combined concepts ranging from a) draw up fundamental questions (start with the essential question), what activities should be done; b) designing the project planning (design a plan for the project); c) draw up a schedule of events / sequence of events (creat a schedule); d) the performers complete with the details of the division of time (determination of day, date and time of each event); e) create drawings that the place of activity (determining the suitability of a length, seating capacity, stage, etc.); f) determining the amount of the invitation, g) determining the facilities and infrastructure required, h) determine the type and amount of consumption, i) calculates the cost of consumption and other costs as a whole; j) monitor student and the progress of the project (monitor the student and the progress of the project); k) test results (assess the outcome); l) evaluation of the experience (evaluation the experience). From project activities to do such students, illustrates that in doing a project, students should take advantage of all its potential, in order to complete it's effective. This requires an adequate life skills life skills both generic and specific life skills related to daily life.

CONCLUSIONAND SUGGESTION
Conclusion

Based on these deliberations are concluded as follows: In order to improve the quality of education, especially with regard to human resources, can be pursued by developing life skills through project-based learning math in elementary school. using the following steps: (1) determine the fundamental question (essential) related to the understanding of the problem, (2) designing the project planning or planned settlement of the problem, (3) scheduling of project activities, (4) to monitor the progress of projects related to the implementation of the settlement issue, and (5) test the process and outcomes of learning or reviewing the results of the settlement of the problem, and (6) evaluate the experience of carrying out activities or projects (reflects). Project-based learning can be done by involving the various concepts are integrated in every lesson.

Develop life skills through project-based learning math in elementary school should be adjusted to the level of development of primary school students thinking, so the life skills developed include generic and specific life skills. For that in teaching mathematics in elementary school, teachers must be able to consider the students' ability to understand the substance of the material in thinking mathematics, numeracy, In addition, the ability of teachers. prepare about tasks that can be solved through project-based learning. as well as the creation of environmental learn math. a conducive and enabling the growth of life skills for students.

Suggestion

Based on the experience of implementing the learning of mathematics-based projects in SD to develop life skills in elementary school, it is expected the teachers to develop learning models other leads to develop life skills of students, For that before implementing the learning, teachers should prepare lesson plan that allows the development of life skills students, by: (1) an inventory of the skills of living that can be developed in SD; (2) selecting a mathematical topics appropriate to develop life skills; (3) determine the method; (4) learning strategies, and (5) the shape and type of assessment to be usde. It has given as follows: for education staff (teachers) are recommended in teaching mathematics materials, teachers should (1) consider the stage of development of the student's thinking, namely the concrete operational stage , with a different emotional state students; (2) provide opportunities for students to develop the ability to freely and focused, so that students can find, analyze, and determine the answers to the problems faced by their own merits; (3) in preparing the subject matter (math's), learning facilities and infrastructure should support the implementation of solutions adapted to the environment students; (4) provide motivation and attention to learn on an ongoing basis in accordance with the needs of students, and does not cause boredom for students.

CREATIVE, INNOVATIVE AND
ENJOYABLE LEARNING MODELS ON SOCIAL SCIENCE

Sri Sugiharti
State University of Malang
e-mail: srisugiharti848@yahoo.co.id

ABSTRACT

Objectives of creative, innovative, and enjoyable learning models on Social Science are: (1) to identify the essence and role of learning model of the basic concept on Social Science, (2) to identify basic concept of creative, innovative, and enjoyable learning models on Social Science, (3) to implement basic concept of creative, innovative, and enjoyable learning models on Social Science, and (4) to analyze learning design in decision-making model. Inquiry is a process to ask questions and encourage the students to study in primary and secondary education. As a practice-oriented method, which refers to investigate and ask question, this term is parallel with problem solving, reflective thinking, and discovery. Inquiry is more than just asking a question. Inquiry is a process to ask certain meaning, which presents individuals intellectual ability in order to understand his ideas. Problem solving method and memorizing are behavior and process. In this context, inquiry provides ways for students to solve problems or to process some information. There are two focuses of learning design models for thinking skills, which refer to critical thinking skills and creative thinking skills. There are four stages of problem solving process in accordance with Savage and Armstrong, which include: (1) recognizing the problem, (2) considering some approaches to solve the problems, (3) selecting and applying those approaches, and (4) achieving solution that would be accounted for. At least, there are two requirements to perform such learning model of decision-making in: (1) social science; and (2) method or ways to be knowledgeable. Methods that can be applied to get knowledge (knowledgeable) include (1) method of tenacity; (2) method of authority; (3) a priori method; and (4) method of science.

Keywords: learning models on social science, creative, innovative, enjoyable

Learning model comprises of two types: direct learning model and indirect learning model. According to Arends (Trianto, 2011 : 29), direct learning model is "a teaching approach, which is specifically designed to support learning process of the students that relate to declarative knowledge and well-structured procedural knowledge that can be taught by activity pattern in stages, step by step". In accordance with Widaningsih, Dedeh (2010:150), procedural knowledge refers to how individual does something, while declarative knowledge refers to knowledge about something.

Direct learning is different from lecturing method, but lecturing and recitation (checking the comprehension through question and answer) has close relationship with direct learning model. Teachers play as informant, therefore they should apply various suitable medias, such as film, tape recorder, pictures, presentation, and etc.

Widaningsih, Dedeh (2010:151) suggested that Characteristics of Direct Learning are as follow : (1) Objective of learning and assessment procedure of learning results, (2) Syntax or the whole pattern and context of learning activity, as well as (3)

management system and supporting learning environment and success of teaching.

DISCUSSION
Learning Models of Basic Concept on Social Science

This learning activity will discuss learning design model of thinking skills. There are two focuses of learning design model for thinking skills that refer to critical thinking skills and creative thinking skills.

Before discussing about critical thinking skills in learning social science, at least three principal questions are asked about concept that should be described in this discussion. *First,* what are critical thinking skills? *Second,* how to teach critical thinking skills? *Third,* why is critical thinking skills needed for students? Those three questions will guide us in understanding critical thinking skills learn social science.

Jhonson (1992) formulated the term "critical thinking" etymologically. He suggested that the words "critic" and "critical" are derived from "krinein", which means "assess something". Furthermore, he described that critic is someones deed, which considers, appreciate, and assess something. People think critically to implement appropriate norms and standard against a result and

consider the value, as well as articulate the consideration.

Moreover, Jhonson (1992) summarized numbers of critical thinking definitions from few experts, such as Ennis (1987,1989), Lipman (1988), Siegel (1988), Paul (1989), and McPeck (1981), who so-called "the Group of Live". He concluded that there are three approvals of substance from critical thinking skills. *First,* critical thinking requires a number of cognitive ability. *Second,* critical thinking requires a number of information and knowledge; and *Third,* critical thinking covers affective dimensions, which describe and emphasize differently.

Ennis (1987) suggested that critical thinking is a term used to describe a reflective activity in order to achieve the goal, which holds faith and rationale behavior. Moreover, she identified five keys of critical thinking that include "practical, reflective, rationale, trusted, and in action form."

Objectives of critical thinking are to assess thought and values, as well as to evaluate the implementation or practices of such thought and value. Besides that, critical thinking covers activities to consider, which based on opinion that has been known. According to Lipman (1988), these considerations should be supported by justifiable criteria.

Beyer (1985) emphasized a set of critical thinking skills that can be used in social study or in learning social science discipline. Those skills include: (a) differentiate between facts and values of an opinion; (b) determine the source of reliability; (c) determine fact accuracy of a statement; (d) differentiate between relevant and irrelevant information; (e) detect any deviation; (f) identify unstated assumption; (g) identify vague demand and argument; (h) admit inconsistent deeds; (i) differentiate whether the opinion is unjustifiable or justifiable; and (j) determine strength of an argument.

Implementation of Learning Model
Learning Model of "Problem Solving"

Savage and Armstrong (1996) stated that a number of problems have the best solution, correctly and exactly. If such situation occurred, teachers should encourage their students to apply "problem solving" approach. According to Savage and Armstrong, there are four stages of problem solving process, such as: (1) Recognize the problem, (2) Consider any approach to solve the problem, (3) Choose and implement those approaches, and (4) Achieve justifiable solution.

Meanwhile, Wilkins (1990) described steps of learning model in "problem solving" that can be used as skills in briefing through individualized instruction method, as follow: first, *clarify and define the problem.* Along with the teachers function/role as facilitator — facilitate — the students, so that in guiding process, teachers listen complaint, expression, difficulty, and problems. Second. *look for alternative of solutions.* When the problem is formulated clearly, teachers may ask the students to think about the solution. Third, *examine alternative of solutions*. Assist the students to examine advantage and benefit of each alternative of solution and capability to do it, as well as the possible consequences. Fourth, *select the solution.* Assist the students to select/choose the enjoyable (appropriate) solution and it will create positive and profitable potency of the results. Fifth, *take action in accordance with the selected solution.* Take an approval to something that would be done. Dont ever take any commitment, which is still doubtful to be done. Sixth, *follow-up.* Besides as facilitator, teachers play their roles to give supports.

Essence and Role of the Basic Concept Learning Model in Social Science

According to the experts, Inquiry Approach is a way to solve problem of the students boredom during learning in class due to the learning process is more student-centered instruction than teacher-centered instruction. The main objective of social inquiry is to make contribution to the policys makers to make decisions. Banks suggested steps of inquiry learning model for social science, as follow: (a) problem formulation; (b) formulation of hypotheses; (c) definition of term: conceptualization; (d) collection of data; (e) evaluation and analysis of data; (f) examine the hypotheses to obtain generalization and theory; and (g) restart inquiry.

Basic Concept Learning Model in Social Science

Design model of thinking skills. There are two design models of thinking, critical thinking skills and creative thinking skills. (a) Johnson, formulated the term "critical thinking" etymologically. He suggested that the words "critic" and "critical" are derived from "krinein", which means "to assess something". (b) Ennis, suggested that critical thinking is a term used to describe a reflective activity in order to achieve the goal, which holds faith and rationale behavior. Objectives of the critical thinking are to evaluate a thought, assess the values, and evaluate implementation or practices of a thought and the value. (c) According to Beyer, there are 10 items of critical thinking skills that can be used in social study, such as: (a) differentiate between facts and values of an opinion; (b) determine the source of

reliability; (c) determine fact accuracy of a statement. (d) differentiate between relevant and irrelevant information; (e) detect any deviation; (f) identify vague demand and argument; (g) admit inconsistent deeds; (h) differentiate whether the opinion is unjustifiable or justifiable; and (i) determine strength of an argument

Designing and Implementing Integrated Learning Model in Social Science Using Problem Solving-Oriented Approach

Problem refers to anything, which creates doubts, uncertainty or difficulty that must be overcome and completed. Furthermore, social problem refers to a situation, which affects most people and considered as difficulty source or dissatisfaction that demanded to be solved. Operationally, social problem means a situation, which does not actually conform to the expected situation.

In general, we recognize three problem solving: (a) authoritative problem solving refers to problem solving, which is done by the competent authority (official, teacher, judge, etc.); (b) scientific problem solving refers to problem solving that uses scientific method. Such scientific method is efforts to find, develop, and justify the knowledge scientifically; (c) metaphysical problem solving refers to problem solving that uses irrational ways, such as mystically.

An approach is a common way in looking and behaving toward a problem. Meanwhile, problem solving approach is applied in learning the integrated social science in order to change the actual condition into specific condition as expected by considering procedures of systematic solution.

Problem solving approach has some benefits and advantages in learning-teaching activities, such as: (a) develop attitude/skills of the students to solve their problems and to make their own decisions objectively; (b) develop thinking ability of the students. Thinking process is a set of skills, for example, collecting information/data, reading and interpreting data, and many others, in which their implementations require practices and make something accustomed; (c) students may comprehend fully to think and develop their interests in various possibilities; (d) develop reasoning and the way to think objectively, autonomously, critically, and analytically, whether individually or collectively.

Designing learning model of Integrated Social Science using problem solving approach

In designing the learning model of Integrated Social Science by using problem solving approach, it should be based on reflective and critical thinking that pursue the working process as follow: (a) recognizing the problem; (b) looking for indication to solve the problem; (c) think possibilities of the solution and the approach; (d) test those solving possibilities along with specific criteria; and (e) use the solution that conforms to certain criteria and leave possibilities of other solutions.

We should select problem solving approaches in class for the interest of learning-teaching process. Therefore, criteria in selecting problem must be concerned. As reference, criteria suggested by Quillen and Hanna are used to select the problem, as follow: (a) the problem is common and repetitious problem, so that it highly well-known and attracts the students attention; (b) the problem is quite important to be discussed in the class; (c) the problem may develop the class to the preferred objective; (d) recognizing any possibility of the required materials for problem solving; (e) the problem may guarantee continuation of learning experience of the students.

After the problems are found, it will be followed by problem solving. Three problem solving models are suggested by numbers of expert, such as John Dewey, Brian Larkin, Lawrence Senesh David Johnson, and Frank Johnson. For further explanation, the descriptions are given below:

First, steps and description of problem solving as suggested by John Dewey: (i) formulate the problem. Recognize and formulate the problem clearly; (ii) analyze the problem. Use knowledge to specify the details and analyze the problem from different points of view; (iii) formulate the hypotheses. Completely comprehend the cause and effect, as well as alternatives of problem solving; (iv) collect, arrange the data to prove the hypothese. Ability to search and arrange data, as well as visualize data in the forms of chart (diagram), pictures, graphics, and etc.; (v) prove the hypotheses. Ability in analyzing and discussing data, connecting or calculating data on hypotheses and skills in making decision, as well as drawing some conclusions; (vi) determine choices of solution/decision. Ability in making, choosing, and assessing, as well as calculating further effects.

Second, Dr. Brian Larkin as a group consultant on Social Science-P3G in Malang 1978 suggested steps of problem solving as follow: (i) definition of the problem; (ii) identification of the problem; (iii) analysis of the effect; (iv) implementation of the criteria; (v) making decision.

Third, Lawrence Senesh, Professor of Economics at Purdue University, suggested steps of problem solving that comprised of three phases: (i) motivation phase; (ii) development phase; (iii) culmination phase.

These are based on the spiral learning theory, in which teachers start it from what they have known to what they have not known, from the simple one to the complex one, from easy to difficult, and from concrete to abstract.

Problem Solving Model in Group

This model was suggested by *David Johnson* and *Frank Johnson*, in which the model is emphasized on problem solving in group that refers to decision making ability. The ability of problem solving in group comprises of several items, such as: (a) establishing an agreement about a condition as expected; (b) agreements in establishing structure and procedure to produce, understand, and use relevant information that conforms to actual condition; (c) agreements in establishing structure and procedure to find possibility of problem solving, deciding and using the best and effective ways in solving the problem.

1) Steps of problem solving in group suggested by Johnson and Johnson as follow: (a) *Definition of Problem.* Definition of problem is the most difficult step. If it is well formulated, the next steps will be easier; (b) *Diagnosis of Problem.* This second step refers to dimension and causes of the problem. The objective is to find out feature and strength that drive to ideal situation and strength, which inhibit to the direction; (c) *Formulating Alternatives of Strategy.* In this third step, the group must search and find various alternatives of problem solving, in which the group must be creative, divergent thinking, comprehend controversy between ideas and high discovering ability.

2) Determination and Implementation of Strategy. After obtaining diverse alternatives of problem solving strategies, the group will decide to choose which alternative that will be used. This step contains two main aspects of problem solving, such as: (a) decision making is a process of making a choice of various alternatives; (b) decision of implementation is a process to take action as required and lead to the implementation.

Evaluation on Success of the Strategy

In this fifth step, the group learns: whether the strategy is successfully applied (evaluating the process), what is the effect of such strategy implementation (evaluating the result) and whether the actual condition is closer to the ideal condition than before the implementation.

Implementation of Integrated Social Science Learning Model by Using Problem Solving Approach

Implementation of the integrated social science learning model uses the problem approach. For example, a teacher may implement integrated social science learning model by using problem solving approach in learning and teaching process in class. The example is curriculum of the fifth grade of Elementary School during the second quarter period. Steps that have been taken by the teacher are as follow: (a) determine the learning objectives; (b) determine subject of the discussion; (c) determine and comprehend materials of the subject that are going to be presented; (d) following the preparation above, teacher will transfer materials of the subject in front of the class by using problem solving approach in group in accordance with the procedure: teacher will divide the class into small groups.

After that, those groups will follow the working process in accordance with guidance and instruction of the teacher as follow: (a) define the problem; (b) diagnose the problem; (c) formulate alternatives of the strategy; (d) determination and implementation of the strategy; and (e) evaluation on success of the strategy

Learning Design Model of Decision-Making

In this learning activity, it will discuss learning design model of decision making, which is specified for Social Science learning. In order to comprehend materials of the discussion about learning model of decision-making, so that the model of inquiry learning design must be completely comprehended.

Learning Model of Decision-Making

Meaning of the "decision-making" concept relates to thinking ability about alternatives of the available choices, weighing the facts and the available proof, as well as considering personal values and social values.

The decision-making process could not be done if the related individual does not possess any knowledge about the related problem (vacuum). Social knowledge is a very important component to achieve logical decision-making.

The second component that must be possessed by the decision-maker is method or means to achieve the knowledge. Knowledge is required to make a reflective decision. Kerlinger concluded four methods to gain the knowledge, such as (1) method of tenacity; (2) method of authority; (3) a priori method; and (4) method of science.

Steps of decision-making process sequentially: (a) recognize the problem in relation to decision that must be made; (b) gain the knowledge through social science inquiry; (c) organize the problem and knowledge for learning materials; (d) inquiry of value; (e) decision making and take action for the citizen; (f) determine the sequence of actions; (g) provide opportunity to the citizen to act and participate (at school and social environments).

CONCLUSSION

Objectives of creative, innovative, and enjoyable learning models on Social Science are: (1) to identify the essence and role of learning model of the basic concept on Social Science, (2) to identify basic concept of creative, innovative, and enjoyable learning models on Social Science, (3) to implement basic concept of creative, innovative, and enjoyable learning models on Social Science, and (4) to analyze learning design in decision-making model.

Rogers (1969) suggested that inquiry is a process to ask questions and encourage the students to study in primary and secondary education. As a practice-oriented method, which refers to investigate and ask question, this term is parallel with problem solving, reflective thinking, and discovery (Hagen, 1969). Beyer (1971) stated that inquiry is more than just asking a question. Inquiry is a process to ask certain meaning, which presents individuals intellectual ability in order to understand his ideas.

Welton and Mallan (1988) compared the term of "inquiry" with problem solving method and memorizing as behavior and process. In this context, inquiry provides ways for students to solve problems or to process some information.

Banks suggested steps in learning model of inquiry for Social Science class as follow: First, formulation of problem. Second, Formulation of Hypotheses. Third, Definition of Term: Conceptualization. Fourth, Collection of Data. Fifth, Evaluation and Analysis of Data. Sixth, Test the Hypotheses to Gain Generalization and Theory. Seventh, Restart the Inquiry.

This learning activity will discuss learning design model of thinking skills. There are two focuses of learning design model for thinking skills that refer to critical thinking skills and creative thinking skills.

Savage and Armstrong (1996) stated that a number of problems have the best solution, correctly and exactly. If such situation occurred, teachers should encourage their students to apply "problem solving" approach. According to Savage and Armstrong, there are four stages of problem solving process, such as: (1) Recognize the problem, (2) Consider any approach to solve the problem, (3) Choose and implement those approaches, and (4) Achieve justifiable solution.

According to Banks, at least two requirements are needed to implement learning model of decision-making: (1) social science; and (2) method or means to achieve the knowledge.

Kerlinger concluded four methods to gain the knowledge, such as (1) method of tenacity; (2) method of authority; (3) a priori method; and (4) method of science.

DEVELOPMENT OF SCHOOL CULTURAL BASED ON LOCAL WISDOM IN SMP NEGERI 2 NGAWI

Sri Wening Rahayu; Bambang Budi W; I Nyoman Degeng; Ibrahim Bafadal
Universitas Negeri Malang
Email : sriweningr@yahoo.co.id

ABSTRACT

At the time of the Asian Economic Community requires qualified human resources, which could have global competitiveness. One way to raise the quality of human resources is through education. School is an institution that is well placed to make it happen by creating a school culture based on local wisdom. This is important because the quality of human resource is a resource that not only qualified in the field of technology, but also who have life skills. Life skills can produce noble character that is supported by the development of a school culture based on local wisdom as long as it is done consistently. The purpose of this research is to find and describe the development of a school culture based on local wisdom in Junior High School State 2 Ngawi as one of the top schools. This research approach uses qualitative research. Data collected through in-depth interviews, participant observation and documentation. The study's findings, among others: that the development of a school culture based on local wisdom includes religious cultures, cultures love the environment, the culture of reading, culture 5S (smiles, greetings, greetings, polite and courteous) and Javanese culture. As for the cultural development phase starting from the granting of ideas, clarification stage, the socialization phase, the implementation phase, the evaluation phase and the follow-up phase. The conclusion of this study the development of a school culture based on local wisdom in Junior High School 2 Ngawi proven to bring these schools into the top schools in the community.

Keywords: school culture, local wisdom

Education is one of the most important things to prepare competitive human resources in achieving success in the era of globalization. Education must be a priority for development, does not rule out other sectors. To promote education not only by changing the curriculum and complementary facilities and infrastructure, but also pay attention to the development of human resources that will carry out the education.

Improving the quality of education is an important factor that must be considered in conducting business in the achievement of national development objectives, such as increasing the quality of human and people of Indonesian and the mastery of science and technology, as well as the embodiment of discipline. propriety in culture-based character education, culture interpreted as something inherited or learned, then pass on what they learned and turn it into something new, that's the core of the educational process. If so, then the task of education as a cultural mission must be able to process; The first cultural inheritance, both help individuals choose the social role and taught to perform the role of the third combining a variety of individual identity within the scope of the broader culture, the fourth should be a source of social innovation.

School is an intuition that can be termed as an organization, so it can not shy away from the challenges that exist and it should be expected to compete in the global kempetisi, can even grow further. In order to become more developed it is fitting now doing consulidation to make new breakthroughs to become a school of excellence (Setyadin, 2009).

Excellent school is a school that is able to bring every student reaches his ability scalable, and shown for capable of achievement . Then School can be interpreted as a quality school, but in the application of all circles found in the featured category implied expectations of what can be expected of students after exit from the top schools. Hope it is nothing but a very important and much needed by parents, the government, society and even the students themselves, namely the extent to which the output (output) of the school was intellectually, morally and skills that can be useful to society.

Things that can be created by a superior school bleak described by Rachmawati (2016) as follows 1) being able to provide optimal services to all children with very different talents, interests learning needs; b) able to increase significantly the capabilities possessed students become self-

actualization which gives pride; 3) able to build strong personality traits, solid and steady in students; 4) able to empower existing resources optimally and effectively; 5) being able to develop comprehensive networking to stakeholders; 6) able to realize the school as a learning organization; 7) schools are responsive to change).

Based on observations in some schools tend to overlook the cultural factors of the school, the school can make it excels in the public eye, especially when accredited, yet they have a significant contribution to the success of school leadership as well. Besides understanding competitiveness in the era of the MEA are still many schools that make sense only in the academic field alone. Instead of exploration development of school culture can make one of the tips of the school is ready to face global competition.

SMPN 2 Ngawi is an excellent school in Ngawi. The advantages of this school can be demonstrated by a variety of things: First, the school put forward a vision and content of the school. Secondly, all activities are directed at the achievement of both academic and non-academic. All three The emphasis on the development of the culture of the school and all four is to create a fun learning environment.

From the field observations, the authors found the phenomenon in this school different from other schools, namely the existence of an organizational culture based on local wisdom held in the school, so the school is heading featured schools.

The purpose of this study is to describe and find the school culture development based on local wisdom.

METHOD

This study used a qualitative research approach. According to Bogdan and Biklen (in Ulfatin, 2015: 23) defines the method of research as a research procedure that produces two descriptive form of words or verbal tertlis of people and behaviors that can be observed. In this case the researchers as a key instrument and act as a participant observer, because the role of observer more than a participant, meaning that as a participant observer is merely a part of the research is not part of a group member.

The source of data on qualitative research based on information obtained from informants recommendation, so that researchers obtain several people who were interviewed are: Head diknas, supervisors, principals, vice-principals, teachers, Shiva and school committee members.

The researchers used a technique that is in-depth interviews, participant observation and and document.

Data analysis used descriptive narrative with steps which refers to the opinion of Miles and Huberman (1980) in Wiyono (2007: 93), namely: (1) data reduction is an activity choosing the right data from the data obtained. Researchers data reduction based on the collected data obtained from the focus of the research, (2). Display data / data presentation is a chain of structured information that enables conclusion, (3). Verification of data / conclusion is an interesting activity within the meaning of the data displayed. To ensure the level of trust in checking the data, the researchers selected data presentation-engineering techniques as follows: (1) testing via triangulation techniques and methods, namely by interviewing six different sources of research focus. (2) Persistence observation. In a study conducted several stages of the investigation, as mentioned by Meleong (2012: 127-148), namely: (1) the pre field (2) phase of field work (3) the data analysis stag

FINDING AND DISCUSSION

Results of research shown some of the following: (1) that the meaning of organizational culture in SMPN 2 Ngawi is a typical characteristic of the school and habits performed by all school personnel (2) there are seven components of organizational culture in SMPN 2 Ngawi, namely: history, vision and mission, school uniforms, everyday language, teachers and staff, discipline, organizational structure; (3) there are seven kararkteristik in SMPN 2 Ngawi, namely: implementing culture 5 S (Senyum, Sapa, Salam, Salim and Santun), competitions in the form of academic and non-academic extra-curricular, organic and inorganic waste distinction ,, sing compulsory and folk songs, religious activities, reading culture, and culture of the Java language, (4) there are three obstacles in the implementation of organizational culture in SMPN 2 Ngawi, differentiation of organic and inorganic waste barriers are still many students who littering and lack of taste awareness to dispose of waste in place, implementation of the extra funding constraints on technical issues after not being an international school, must be supported by the school committee; and there most of the

children who do not all apply the Java language in schools (5) there are three support in the implementation of the organizational culture in SMPN 2 Ngawi, of carrying out the exercise classes and extra-curricular activities other has a supporting factor that SMPN 2 Ngawi including excellent schools and achievement in academic and non-academic, differentiation of organic and inorganic waste supporting factor that got confidence in fostering a sense of cleanliness of the Environment agency (DLH) and has three compost, and received support from various related agencies such as the department farming, agriculture, police and BKKBN. has a supporting factor that whole school community and parents support a culture sekolah.dan various activities related to the academic and non-academic.

Importance organizational culture based on local wisdom in the school

The importance of building an organizational culture in school, especially with regard to achieving the objectives of school education and improved school performance. As stated by Stephen Stolp (1994) on School Culture, published in ERIC Digest, from several studies indicate that organizational culture in school correlates with increased motivation and student achievement and teacher job satisfaction and productivity. Likewise, a study conducted Leslie J. Fyans, Jr. and Martin L. Maehr about the effect of the five dimensions of organizational culture in schools, namely: academic challenges, comparative achievement, awards to achievement, school community, and perceptions about the purpose of the school shows a survey of 16310 students grade four, six, eight and ten of the 820 schools general in Illinois, they are more motivated in learning through organizational culture in schools is strong. Meanwhile, studies conducted, Jerry L. Thacker and William D. McInerney to the test scores of elementary school students showed the influence of organizational culture in schools on student achievement. The study did focus on a new mission statement, goals based on outcomes for students, curriculum alignment corresponding with Reviews those goals, staff development, and building-level decision-making. Organizational culture at the school also has a correlation with the attitude of teachers in work. Studies conducted Yin Cheong Cheng prove that

"stronger school cultures had better motivated teachers. In an environment with strong organizational ideology, shared participation, charismatic leadership, and intimacy, teachers experienced higher job satisfaction and Increased productivity ".

Efforts to develop an organizational culture in schools, especially in respect of the principal tasks as leaders and managers in schools. In this case, the principal should be able to see the school environment in a holistic manner, in order to obtain a broader framework for understanding the issues that are difficult and complex relationships in school. Through the deepening understanding of the organizational culture in school, then it will be better in giving the refinement of the values, beliefs and attitudes that are important to imp2. The development of an organizational culture based on local wisdom in the school.

There are five aspects of the organizational culture of the school that held that culture 5 S (Senyum, Sapa, Salam, Salim and Santun), religious culture, reading culture, net culture, and Javanese culture. In essence done berimabang, unified and integrated with teaching and learning in schools. By understanding the concept of organizational culture as mentioned above, then the following will be described on the application of organizational culture in the context of schooling. In general, the application of the concept of organizational culture in schools is actually not much different from the application of the concept of organizational culture more. Even if there are differences may simply lie in the type of dominant values are developed and the specific characteristics of their supporters. With regard to supporting organizational culture at school Paul E. Heckman, as quoted by Stephen Stolp (1994) argues that "the commonly held beliefs of teachers, students, and principals."

The values developed in school, of course, can not be separated from the existence of the school itself as an educational organization, which has the role and function to try to develop, preserve and pass on cultural values to their students. In this case, Larry Lashway (1996) states that "schools are moral institutions, designed to promote social norms ...".rove the stability and maintenance of the learning environment.

The development of an organizational culture based on local wisdom in the school

There are five aspects of the organizational culture of the school that held that culture 5 S (Senyum, Sapa, Salam, Salim and Santun), religious culture, reading culture, net culture, and Javanese culture. In essence done berimabang, unified and integrated with teaching and learning in schools. By understanding the concept of organizational culture as mentioned above, then the following will be described on the application of organizational culture in the context of schooling. In general, the application of the concept of organizational culture in schools is actually not much different from the application of the concept of organizational culture more. Even if there are differences may simply lie in the type of dominant values are developed and The values that may be developed in school is certainly very diverse. When referring to Spranger thought as presented by Sumadi Suryabrata (1990), then there are at least six types of values that should be developed in school. In Table 1 the following proposed six types of Spranger and its value is essentially behavior.

Table 1. Type Values and Behavior Essentially by Spranger

No	Values	Behavior Essentiality
1	Science	Thinking
2	Economic	Work
3	Art	Enjoy the beauty
4	Religious	Addored
5	Community	Worship/sacrifice
6	Politics/State Reign	Govern

Each program should be no assurance keterlaksanaan activity and success. It is intended as a control so that the activities can be carried out in accordance with planning. The process can be a guarantee could be activity monitoring / supervision and evaluation of adherence to the change program that has been determined. Likewise, the enforceability of the guarantee and the successful development of the school culture. Furthermore, to carry out the process of guaranteeing the success of any school culture principals need to establish monitoring and evaluation team consists of at least four people came from elements of educators, the School Committee and School Supervisor as technical Trustees. To meet the completeness of this activity principals need to lead the team to program monitoring and evaluation instrument development school cultur Top of Form the specific characteristics of their supporters. With regard to supporting organizational culture at school Paul Heckman, as quoted by Stephen Stolp (1994) argues that "the commonly held beliefs of teachers, students, and principals."The values developed in school, of course, can not be separated from the existence of the school itself as an educational organization, which has the role and function to try to develop, preserve and pass on cultural values to their students. In this case, Larry Lashway (1996) states that "schools are moral institutions, designed to promote social norms ...".

CONCLUSION

The importance of organizational culture based on local wisdom is strongly influenced by the participation of the entire school community and stakeholders, so that it will achieve the goals of the school into the top schools in the public's favorites. Inheritance of cultural values should be done in a systematic, continuous and more consistent. This is done so that the continuity of the school organizational culture can be realized for generations.

The development of school culture must be concentrated on the strategic planning of the school and the achievement of development targets school culture. For that schools need to collaborate with various agencies such as police forces, Garbage Bank,LSM, the Ministry of Forestry, and BKKBN. The development of school culture based on local wisdom must be dynamic for was required of evaluation and continuous improvement.

This advice is addressed to the principals to always control the implementation of the school budayan based on local wisdom, this is very important because it can support the inheritance of the noble values from generation to generation at the school. Furthermore, the head of the national education should be facilitating matters needed schools in implementing school culture based on local wisdom. Besides, it is also important for education professionals to constantly learn from the implementation of the culture of the school in order to support the implementation of character education and improving the quality of education.

LANGUAGE-DRIVEN CLIL LESSON PLANNING:
A TEACHER PROFESIONAL DEVELOPMENT FOR
PRE-SERVICE ENGLISH TEACHER

Suhandoko

SMA A. Wahid Hasyim, Tebuireng, Jombang, Indonesia

e-mail: luki.hidayat@gmail.com

ABSTRACT

As a continuing process, teacher professional development should begin when a student-teacher embarks on their teacher training program. For this purpose, introducing CLIL as an alternative approach to communicative language teaching in pre-service education is necessary. However the lack of lesson plan guidelines in CLIL education has required the research on strategies to be implemented. This study presents a review of relevant related literatures and proposes an idea of language-driven CLIL lesson planning ready-made to be used in EFL classrooms.

Keywords: *continues professional development, teacher professional development, collegial activity*

Content and language integrated learning (CLIL) has been discussed and criticized among teachers particularly by those who are teaching English as a foreign language (EFL) and more predominantly about which models best fit toward the context in which CLIL is applied. Among the benefits which may be offered by CLIL instruction compared to traditional EFL instructions are the possibilities of the students' motivation enhancement (Banegas, 2011), the plausibility that it may build students' confidence (Vazquez, Molina, & Lopez, 2015; Manafe, 2014), the provision of meaningful learning (Cenoz, 2015) and second language acquisition (Rachmajanti, Zen, &Apriana, 2015).

In Indonesia and possibly in other countries in which English is foreign language, CLIL which is also commonly known as bilingual education or English is used as the medium of instruction for non-language subjects. Unfortunately, CLIL implementation is still scarce due to the fact that it is meant merely as the teaching contents using the target foreign language. CLIL is actually spanned into two approaches in continuum: content-driven and language-driven (Mehisto, Marsh, Frigols-Martin, 2008; Coyle, Hood, & Marsh, 2010). To this point, therefore, CLIL instruction can be defined as both teaching contents in the target foreign language and teaching the target foreign language with incorporating other non-language contents. The misunderstanding about CLIL instruction may cause the reluctance among

EFL teachers to explore more about CLIL and, further, to incorporate CLIL in their teaching activities or in this case lesson plans.

This study presents a review of relevant related literature and proposes an idea of language-driven CLIL lesson planning ready-made to be used in EFL classrooms.

DISCUSSION
CLIL And Teacher Professional Development

As the most important part in successful education, teachers are required to keep up-dated with and improve their knowledge, skills, and practice in their teachings. Teachers are demanded to have good competencies and performances as well as active involvement in their professional development, engagement with current issues and trends and strong commitment in their teaching practices at school. As Cahyono (2008) and Tanang& Abu (2014) state that teacher professional development should not only be seen as a duty but also as a necessity to improve their quality of their teaching to answer the recent development and, therefore, assisting teacher to update their knowledge and skills and to deal with changes is inevitably required.

As an on-going and continuing process, teacher professional development should begin when a student-teacher embarks on their teacher training program (Lingam, Lingam, &Raghuwaiya, 2014). It is also both soothing and challenging not only for students-teachers but also teacher educators involved. To certain extent, the meaningful integration of theory and practice is

central to the lasting discussion of how to theorize and implement foreign language teacher education.

In general, teacher professional development takes two main forms, the pre-service and the in-service. This study focuses on the discussion on pre-service teacher education. Pre-service teacher education means the education for teachers before they enter into service as teachers. During this period of teacher education program, teaching practices ad theories go side by side. In addition to the field-related materials the pre-service teachers get during their education, they should also be introduced to and familiarized with the current teaching methodologies in order to optimize their knowledge and practice such as content and language integrated learning.

Content and language integrated learning emerged as an alternative to foreign language teaching approach is based on the fact that teaching English as a foreign language (TEFL) has been portentously defined as teaching English for no obvious reasons (TENOR) by some people. Theoretically speaking, teaching English as a second language (TESL) is defined as teaching language for learners who will use the target language in their host society and therefore the language is motivating by itself. Compare to TESL, TEFL is defined as the teaching English for the students who will unlikely use the language in their host society. Hence creating pseudo-motivating factors will be likely fostering the learners' engagement and acquaintance with English. For this purpose, teachers are required to hunt for a method to pull students into showing some interest which is not really something easy to perform for everyone.

One alternative way to enhance the motivation in learning foreign language is by contextualizing the language learning with the students' needs or specifically on what the students are actually learning apart from the language subject (i.e. Biology, Math, etc.). Methodologically speaking, this is known as integrating content and language learning or content and language integrated learning (CLIL). In the context of ELT, it is more commonly known as language-driven CLIL or the weak CLIL. As a form of assisting process for pre-service EFL teachers, it is therefore highly recommended that language teacher education to include it in the curriculum of language teacher education (Banegas, 2015).

Marsh, Nikula, Takala, Rohiola, &Koivisto (n.d.) outline the type of areas to include in the initial CLIL teacher training curricula covering foreign language teaching methodology, communicative-interactive methodology, communication competence and performance, immersion program, content-based foreign language curricula, form-focused versus meaning-focused instruction, foreign language teacher talk in CLIL, and CLIL teaching materials and assessment. This curriculum should not be seen as an exclusiveness of language teacher program where it is only offered as a part of internalization of language teacher education, instead it should be seen as a comprehensive curriculum within the language teacher education because the recent development of language teaching demands that it deal not only with the learning of the language itself but also make it as an investment for globalized education.

As a foreign language teaching methodology, particularly in Indonesia, CLIL is also inescapable from many shortcomings, especially when it is included in language teacher education. The institutions providing the language teacher education are required to earnestly analyze the needs of both the language and content curriculum before all actions begin. They are also required to equip the teacher-candidates with the ability of team teaching either by immersing it into the curriculum or by providing model. This is important especially when EFL teachers are required to cooperate with the content teachers in the classroom in order that they are prepared with the ability to manage the classroom on which emphasis to be focused on whether on the language or the content. Among all those challenges to be dealt with, other factors which should also be taken into account when language teacher educations decide to have CLIL in their curriculum are providing the access for the post-in-service training opportunities, immersion centers to facilitate the teachers, and teaching materials developments. This, according to Coyle (2007), is the paramount factors to be dealt with for assuring the quality of CLIL.

Language-Driven Clil Curriculum And Lesson Planning

In general, curriculum is defined in three levels: forward design, central design, and backward design (Richards, 2013). In central design, curriculum begins with the classroom process and methodology. Syllabus and learning outcomes are specified during the curriculum implementation. In backward design, the curriculum starts with the specification of objectives and methodology, while syllabus is created based on the specification of the objectives and the methodology selected. In forward design, in which CLIL is positioned, curriculum starts with the syllabus planning followed with methodology and assessment of learning objectives. Therefore, once content (language and contents) is agreed, methodology, outcomes, and assessment are later discussed.

In the provision to implementing CLIL methodology successfully, Mehisto et al. (2008) formulate the core features of CLIL methodology covering 1) multiple focuses, 2) safe and rich learning environment, 3) authenticity, 4) active learning, 5) scaffolding, and 6) cooperation. These core features should be guided by three clear outcomes both 1) Content-related learning outcomes, 2) Language-related learning outcomes that support the acquisition of content, and 3) Outcomes related to general learning skills.

While Mehisto et al. provide the core features and the outcomes in CLIL, Coyle et al. (2010) formulate 4Cs (content, cognition, communication, and culture) framework to ensure that learning is understood in holistic of both language and content integration and Language Triptych (language of learning, language for learning, and language through learning) to ensure that content specific-discourse and language is included in the language learning in completing the tasks.

Banegas (2015) in his study analyzed how the trainees of Didactic module perceived CLIL in their lesson planning practice. The analysis covered how the trainees identify learners' both cognitive and linguistics levels, structure the lesson, select the contents the language, formulate aims, set the language activities and content activities, and use the materials.

Identifying learners' cognitive and linguistics levels

The first thing required to define in planning CLIL-based lesson is identifying students' both cognitive and linguistic level. The requirement of the appropriate cognitive and linguistic level to the subject which students are learning is an ideal condition for successful CLIL implementation (Mehisto et al. 2008:12). As an implication of teaching which integrates content and language, the lesson is required to be both linguistically supporting and cognitively challenging (Coyle et al. 2010: 43) to enable new dialogic learning to take place. In this case, identification and organization of the level of knowledge (language and content) is required. Text (spoken or written) which is the source for information needs to be structured following the diagram of thinking to facilitate learning and the creation of activities which focus on both language development and core content knowledge. The revised Bloom's cognitive taxonomy (Anderson, Krathhowl& Bloom, 2001) might be working as guidance to structure the lesson that enable learners to undergo thinking skills from the lower to the higher order thinking skills, from remembering to creating. The order actually reflects the knowledge processing and knowledge; however, it is not supposed to be followed rigidly because the steps might overlap each other for example it does not mean that after understanding stage then goes to applying, instead it may goes like this. After students understand a text, they then analyze the structure of the text, apply the text structuring in a new text, and directly create a text and so on.

Structuring the lesson

After the cognitive and linguistic level of the students are analyzed, structuring a lesson is probably is the most important part of all lessons planning because it reflects the way the teaching and learning activities is run. In structuring a lesson, three-stage development is highly recommended covering warm-up stage, development stage, and closure stage. These three stages are actually not CLIL exclusive. They are essentially shared among all lesson planning practices. In warm-up stage, the lesson is started by prior knowledge activation for examples through elicitation and presentation of the new content. In development stage, students are exposed to and engaged with the target content and language for example through form-focused instruction, vocabulary building, guided practice, etc. In the

closure stage, the target content and language is summarized for example through a freer practice activity, wrap-up, setting a homework, etc.

Selecting content and language

Another thing need to be considered in CLIL lesson planning is content and language selections. Coyle et al. (2010: 28) underline that what is meant by content here is the non-language feature in the lesson plan. In CLIL context, content is not merely defined as discipline such as geography, history, or science. In a larger scope it may be defined as thematic content (i.e. ecosystem, global warming, etc.), cross-curricular content (i.e. climate change), interdisciplinary content (i.e. health in community etc.), etc. (Coyle et al. 2010: 28) as long as it is in line with the school subject curriculum. Therefore the meaning of 'content' is dependent to the context of the learning situation where CLIL is used. Along with the selection of 'content', aspect of 'language' is also chosen. This aspect is as equally important as content as implied in the content and language integration. Banegas (2015) highlighted that in the 'language' aspect, the language required to access the content skills and to carry out the classroom tasks is determined for example grammar, discourse function, lexis, phonology, and transactional expressions (i.e. describing, debating, evaluating, etc.). It is in this aspect Coyle et al.'s (2010) Language Triptych plays its role to make the interrelationship of content objectives and language objectives explicit.

Determining lesson aims

As implied in forward CLIL curriculum design, lesson aims are set once the content and language are fixed. In CLIL context, aims are defined in three interrelated ways: content aims, language aims, and learning aims (Banegas, 2015; Mehisto et al. 2010: 12). The examples of lesson aims are as follows:
Content aim: to learn about the solar system
Language aim: to use comparative and superlative adjectives
Learning aim: to develop summarizing strategies

Designing content activities

Although language-driven CLIL emphasizes a bit more on language learning, it does not mean that the activities are content separated, instead it challenges EFL teachers to incorporate appropriate content in their CLIL class without overemphasis on the contents. In designing the content activities, both content presentation and introducing or deepening language should be encouraged. Teachers should not only focus on content presentation for the sake of assisting students with simple and easy contents. They should also consider the aspect of language to be introduced or deepened because both content and language should be progressed in CLIL instruction.

Developing materials

As thesummitof all lesson planning activities, materials act important roles as providing input particularly as scaffolding input. From materials, students have access and are able to deepen their content as well as language. As a main source of input, texts which will be used in the classroom need to be selected or even if selections are not possible, text modification and adaptations are necessary. Although this concerns with the authenticity of the texts, text adaptation is still required for the purpose of text comprehensibility and language pedagogy. Adaptation and modification might be necessary in order to suit the activities and input level to students cognitive and linguistic level. Although adaptation and modification concern with the less-authenticity of the materials, they have its own and more preferred place especially when it deals with comprehensibility of the materials. More exposure on the target language is a must, but to make it more comprehensible is a better option.

Designing classroom activities

Actually, language-driven CLIL is just similar to integrated skills based language teaching, therefore the tasks should enable students to get exposure on all language skills although it might be necessary that one skill is the main purpose of the lesson. Besides that, the tasks should also take into account the balance of meaning-focused and form-focused instruction. In meaning-focused instruction students are expected to reconstruct language through experiential learning with the content knowledge exposure. However, in order to be able

to communicate the new construction of content knowledge, they need the help of form to express the content in appropriate manner.

Setting the assessment

In a lesson plan, an assessment is usually set especially the formative assessment. This usually becomes a problem especially when teachers cannot take a position on which CLIL is to perform. When teachers decide to implement language-driven CLIL, therefore the assessment should be emphasized on the language although it does not deny the possibility of focusing on the content especially

if it deals with the assessment of ideas in students' productive language (writing and speaking).

To this end, initiating language-driven CLIL in language teacher educations should be responded better by including CLIL in EFL lesson planning is the utmost and crucial issue in order to improve performance of TEFL.In planning CLIL lesson, teachers are required to be familiar with the characteristics of CLIL lesson that:

1) lessons must be integrative both language and skills and receptive and productive skills;
2) lessons must be based on reading or listening texts/ passages because the integration of content and language requires students to access information related to both content and language;
3) lessons should be based on the complexity of content not on the complexity of language structure;
4) language should be approached both lexically and grammatically;
5) language contents should be functioned properly in subject context;
6) lessons must consider the students' learning styles;

CONCLUSION

As the impact of the challenges for 21st century teacher nowadays namely 1) the reality that English is required in many contexts, 2) the knowledge required to communicate with the students from different contexts, 3) specific skills required by teachers to participate in the context of communication with students require language teacher education to equip the teacher-

candidates to be responsive toward the development of language teaching methodology that suits the learners' needs. By equipping the teacher-candidate with language-driven CLIL lesson planning skills in their education, they have been prepared to make EFL teaching more motivating, meaningful, and contextualized to the learners' needs. In addition to the requirement of language teacher education to be more responsive toward the recent development, teacher education should also enable teacher candidates to develop a critical perspective, providing them with the necessary means to nurture their continuous practice through the integration of theoretical innovations.

UTILIZATION OF NETWORKS FOR IMPROVING THE QUALITY OF TEACHING AND LEARNING IN PRIMARY SCHOOL

Suharjo
State University of Malang, Indonesia
Email: suharjofipum@yahoo.com

ABSTRACT

Education quality is one of the most important issues in Indonesia. Therefore, the Government of Indonesia (GOI) has prioritized the issue during several decades. A number of efforts for improving the quality of primary schools in Indonesia have been done to date, such as providing competence teacher, improving school management, developing innovative teaching and learning approach, conducting school self evaluation, implementing school accreditation, and providing and improving school facilities. However, the quality of primary schools have not increased significantly yet. One of the methods of improving the quality of primary schools is by utilization of network capital. It is formed from collaborative practices emerging from e-enabled human networks. The utilization of networks capital at the public primary schools by school stakeholders holds important roles in improving the quality of educational attainment.

Keywords: networks, improvement, quality, teaching, primary school

Education quality is one of the most important issues in Indonesia. The Government of Indonesia (GOI) has prioritized the issue during several decades. It has been stated on the National Midterm Development Planning that the targets of education development are to improve the access of society to education and to improve the quality of education (RPJMN, 2010).

There are three reasons for improving the quality of education in Indonesia. First of all, the quality of education input in the country is poor. It can be measured by a number of standards, such as school facilities, content, teacher and education administrator, and minimum service standard of education (Peraturan Pemerintah No. 19, 2005; Permendiknas No 15, 2010). For example, only 41,31% of primary school facilities (class rooms) in East Java province were good. Similarly, there were many teachers in the province who did not get bachelor degree in education and certificate of education (Provincial Education Office of East Java, 2009).

Second, the quality of education process in Indonesia is not good enough. The quality of education process can be seen by several indicators, such as student repeater rate, and student drop out rate. In East Java province for instance, the number of student repeater rate in primary schools was 2.56% or 103,883 students (Provincial Education Office of East Java, 2009). The student repeater rate was higher than those of the national standard of student repeater rate (<1%).

Finally, the quality of education out put in Indonesia was also poor. For instance, the education attainment of Indonesian students at international level was poor. According to the result of TIMSS (*Trend in International Mathematics and Science Study*) in 2007, the score of mathematics of Indonesia students was 397, and the score of science was 427. These scores were below the average score of TIMSS, namely 500 (TIMSS, 2007). Similarly, according to the result of PISA in 2009 indicated that the proficiency of reading, mathematics, and science literacy of Indonesia students of 15 years old was poor. The score of the test in mathematics was 371. The ranking of the score was 61 of 65 countries which participated on the test (PISA, 2009).

A number of efforts for improving the quality of primary schools in Indonesia have been done to date, such as providing competence teachers, improving school management, developing innovative teaching and learning approaches, conducting school self evaluation, implementing school accreditation, and providing and improving school facilities. However, the quality of primary schools have not increased significantly yet. There are a number of ways to improve the quality of teaching and learning in primary schools. One of them is by using networks as part of social capital in our society.

DISCUSSION
The role of networks for improving the quality of teaching and learning

Indonesia has a large number of social capital. According to Bourdieu (1986:248) "Social capital is the aggregate of the actual or potential resources which are linked to possession of a durable network of more or less institutionalized relationships of mutual acquaintance and recognition". Similarly, Putnam (2000: 19) argues

that "social capital refers to connections among individuals-social networks and norms of reciprocity and trustworthiness that arise from them. In that sense social capital is closely related to what some have called civic virtue". Finally, Fukuyama (1995: 10) defines that "social capital is the ability of people to work together for common purposes in groups and organizations".

One of important dimensions of social capital is network. Network in primary school is accumulated personal relationship among the people in the school when they interact each other inside and or outside the school. The network can be categorized into two forms. First, school internal network. It is called bonding. Bonding was occurred when the people in the school have strong tied personal relationship with the people in the school and they interact each other. Second, school external network or bridging. It meant that the people of the schools had relationship with other people outside the schools. For instance, they have relationship with school inspector, sub district education office, district education office, and so on.

Similarly, Michael Woolcock has tried to identify three broad categories of social connections: (1) binding social capital, comprised of ties between like people in similar situations, such as immediate family, close friends and neighbors; (2) bridging social capital, which is made up of more distant ties with like persons, such as loose friendship and workmates; and (3) linking – or scaling – social capital, which reaches out to unlike people community, thus enabling members to leverage a far wider rang of resources than are available within the community (Woolcock, 1998: 13-14).

Another theoretical foundation for understanding the networks or interaction can be found in Homans' (1950) studies of small primary group. He postulated in principle the reciprocal and positive relationships among three factors: interaction, sentiment, and activity. The more individuals interact, the more likely they are to share sentiments and the more they engage in collective activity. Likewise, the more individuals share sentiments, the more likely they are to interact and engage in activities (Lin, 2004).

Naturally, primary schools in Indonesia have both internal and external networks. However, the pattern of access and utilization of the networks were different among the primary schools. For example, the primary school of type A (big school) has more access and utilization of external network (bridging) than

those of the primary school of type C (small school) (Suharjo, 2014). The big primary school has external networks as follows: (1) relationship with other schools, (2) primary school principal working group, (3) primary school teacher working group, (4) Indonesia Teacher Association, (5) District Education Office (school inspector), (6) school committee members, (7) group of students' parents at each grade, (8) students' parents, (9) students' sibling, (10) non formal education/subject course, (11) higher education, (12) social organization, (13) bank, (14) entrepreneur, (15) religious institution, (16) non government organization, and (17) mass media. In contrast, the small primary school has external networks as follows: (1) relationship with other schools, (2) primary school principal working group, (3) primary school teacher working group, (4) Indonesia Teacher Association, (5) District Education Office (school inspector), (6) school committee members, (7) group of students' parents at each grade, (8) students' parents, (9) students' sibling, (10) non formal education/subject course, (11) higher education, and (12) social organization (Suharjo, 2014).

Utilization of the networks in the primary schools have important roles in improving the quality of teaching and learning. First of all, utilization of the networks provide innovation in teaching and learning. A variety of teaching innovations have implemented at the school, for instance, implementation of AJEL (Active Joyful, and Effective Learning), bilingual teaching, habit-forming of students, information and technology using for teaching, a number of extra curriculum activities, and lesson study. Research finding indicated that using longitudinal and network data in a study of the implementation of computer technology in six schools, the researchers find the effects of perceived social pressure and access to expertise through help and talk were at least as important as the effects of traditional constructs.

Second, utilization of networks give value added for improving the students' achievement. The quality of school is not only in term of better students academic achievement, but also the quality of students' personality, creativity, and autonomy. The quality of students' academic achievement have increased dramatically in a primary school which utilized the networks. For example, the grade and the result of the national examination of the students are increased. Based on research findings regarding "Social Capital and Academic Achievement: Better School Performance through Improved Relations Between Students,Teachers and Parents" indicated that higher Mathematics scores are associated with schools where principals often supervise and interact with teachers; where principals know at least three quarters of the families in the school; where there is parental

financial or material support and involvement; and where the principal values parental involvement (APHRC, 2010).

Similarly, the primary school which utilized internal networks through several programs of habit-forming such as praying together and memorizing the Holy Quran verses before starting a lesson, conducting school ceremony, reading "Asmaul Husna" (directed by the fourth until sixth students), learning English in Fifteen Minutes, doing gymnastic, cleaning school environment, listening to seven-minute religious education, and singing national anthem – Indonesia Raya have important role in improving the quality of students' non academic achievement.

A research finding regarding the social capital in a primary school indicated that utilization of the networks can improve students' non-academic achievement. Several indicators of the success can be seen in terms of the results of competition in religious education, Indonesian, English, fashion, information technology, art, mathematics, science and mathematics, and national examination (Suharjo, 2014).

Another research regarding the role of network for improving teaching and learning was conducted by Lam (2006). He found that the results of his research support Coleman's thesis of social capital in the creation of human capital. It also underscores the importance of bridging social capital in student's learning.

CONCLUSIONS

Based on the research findings, it could be concluded that: utilization of networks in primary school had important role in improving the quality of: teaching and learning. In other word, utilization of the social capital in dimension of networks at the school gave positive contribution for improving the quality of teaching and learning in the primary schools. The networks have importance roles in providing innovation in teaching and learning, improving students' academic achievement, and students' non-academic achievement. The successful of both academic and non-academic achievement of the students at the public primary school indicated that networks dimension built by the school gave positive value added for improvement of teaching and learning.

ABSTRACT

Sunda Etnomatematika referred to in this research is mathematical in Sundanese culture Sundanese applied in everyday life now.Ethnic Sundanese Sundanese people living in the area of West Java, the Sundanese language and customs activities reflect Sunda.EtnomatematikaSundain this study is limited to three activities: estimating, patterns and measure. Of these three activities the termcubical, brick,and trackpihuntuan.

Keywords: Etnomatematika Sunda, Estimate, Pattern Making and Measuring

Mathematics is the knowledge that is universal and underlies the development of science and technology. Mathematical knowledge is inherent (inherent) in everyday life, in which each of the activities undertaken daily will not be separated from the activity mathematically. In the marketplace, in the fields, in the fields, and a variety of human activities, the phenomenon mathematically always appear even many human activities that unconsciously a part of mathematics. in other words, the math is very close to the culture in the context of the behavior or habit that has existed since ancient times is done for generations.

In historical perspective, mathematics is essentially grow and develop from customs or culture generally accepted and agreed upon. Pandang course, how the birth of geometry at the time of the Babylonian and ancient Egyptian civilization around 5000 SM or 4000 SM to 500 SM.The use of visible geometry of construction-construction ancient civilizations, such as irrigation, flood control, drainage of swamps and large buildings. In the days of Egypt Kun o, geometry is used to reconstruct the boundaries of land on the edge of the Nile due to flooding. The flooding that always hit the banks of the Nile has removed the boundaries of land owned by the local community. The Egyptians are working hard to re-define the boundaries of the land without clicking the i area previously owned. The Egyptians later found measurements of length and wide as the system boundary demarcation agreed upon by the community and is often used to solve problems whenever the lands that they garap flooded back.

In a further development, the Babylonian and ancient Egyptian civilization is regarded as the forerunner of the birth of the branches of knowledge of mathematics, ie geometry. Possible knowledge awa lnya are cultural, such as: per try an observation, assumed / estimated or activities that are intuitive, later evolving into knowledge that is standardized and universal. The geometry is then subjected golden peak in the era of Euclid (300 SM) with the construction of knowledge of geometry through an axiomatic system. Geometrical forms the base as has been widely used in the culture of the people previously regarded as *primitive concept* (knowledge base, a concept which is not defined). Links between this concept was spawned definitions, postulates / axioms and theorems that build a deductive system. The system deductive here which is accepted as the mathematical knowledge and placing geometry as a branch of mathematics.

Referring to how mathematics is found, the historical facts show that the birth of mathematics can not be separated from the culture from one era to the next. If fact, therefore, very appropriate if mathematics is seen as a product of culture (Sardjiyo & Pannen, 2005). Because mathematics is a cultural product, the development of mathematics would not be separated from the development of existing culture. In contrast, the extent of mathematical knowledge is growing, the implication is how mathematics influence on the development of culture in order to achieve a civilization.

Basically, human civilization will not be separated from the development of culture and mathematics. Nevertheless, because of the way to get it is different, not least appear skeptical that many of the community's culture that actually can not be separated from the activities of mathematical but considered separately or not be illuminated for the development of mathematics today. This search will bring to the study of the so-called etnomatematika. Gerdes (1994) revealed that e tnomatematika is mathematics applied by certain cultural groups, groups of workers / peasants, children of the community a certain class, the professional classes, and others. Culture in this context is certainly memili ki per perspectives are spacious and uniquely attached to the customs of

everyday life, for example: gardening, playing , creating, solving a problem, how to dress, and so on.

In particular ethnicity, culture inherent in society are typical and may vary with other ethnic groups. For example in the community (tribe) Sunda, how the *Sundanese* count or mention the many, *Hiji(one), two(two), tilu(three),Opat* (four) *...etc.,salikur(twenty-one), salawe(twenty-five),sakodi(twenty), Saraju(forty), sawidak(sixty), salaksa* (ten *thousand), Saketi* (one hundred *thousand),* uses the term time; *Wanci tumorek* (00.30), *Wanci disada rorongkeng* (02:30), *Wanci haliwawar* (3:00 to 3:30 pm), *Wanci Balebat* (05.00), ... etc .; the vast size; *satumbak* (3.77 m), *sabata* (14 m $^{2)}$,*sapal* (1.5 km), *saelo* (0.688 m), ... etc; calendar system (similar to dating hijriyah; month 1 *(Pleiades,* 30 days), the 2nd month *(margasira,* 29 days), the 3rd month *(posya,* 30 days), ..., and so on. In the game Sundanese rules thick with mathematics, *bubudugan, gatrik, galah, dam-daman, lelempengan,encrak, sunda manda, ... etc;* and more Sundanese culture is very strong with a mathematical activity.

Behind the terms mentioned above, in fact a lot of the behavior and habits of the Sundanese interesting for further study. Behavior and habits, among others, appeared on the activities o *rang* Sunda in doing three activities; *estimate,create patterns,* and *measure.* In assessing the activity, the term *cubical* which is used people Sunda to estimate the volume of logs (either already finished or still in the forest), the volume of stone or brick (usually collected at the home page), and so on. In the course of making the pattern of the term *pihuntuan.Pihuntuan* a benchmark (*ugeran)* used *the* Sunda to construct bamboo craft that became typical of Sunda. In the course of *measure* (eg, widely used in measuring land paddies, fields, and gardens) the term *brick.* Bata shows the measured area of land, equal to 14m ^{2,} or they sometimes made up his number to 14 m $^{2.}$It's unique use of *brick* term is how the activity of *the* Sund a conducting measurements on fields, fields or gardens with an irregular shape (non-Euclidean geometry).

The third addition to the above activities, is still a lot of behavior and customs of *the* Sunda that can be categorized in etnomatematika. Sunda history itself reaches a very long period of time, ranging from Banten (Babad Salakanagara), to spread covers a whole area of West Java (Babad Tarumanagara, Sunda, Galuh Pakuan, pakuan pajajaran until the time of the spread of Islam throughout the region of West Java). Although all three

activities that are the subject of this paper do not represent actual Sundanese culture, but the focus of study of this paper is not on the exploration of Sundanese culture, but the mathematical concepts (shown) practiced in Sundanese culture. In other words how *the* Sunda bermatematika according to the customs or habits inherent in their daily lives.

Etnomatematika associated with the study, the studies in this paper will focus on two things: (1) how *people* Sunda perform mathematical activity in their daily lives, (2) how *the* Sunda practice mathematical concepts in their everyday culture. The first study seeks to unravel the mathematical activity that unwittingly carried *the* Sundanese. With in-depth study (further study), the knowledge gained from this first study will possibly generate new mathematical knowledge, both from the perspective of mathematics or mathematics education. The second study sought to uncover the extent of the underlying concepts *person* Sunda (in accordance with the understanding) to solve their problems. It is this second study provides space on culture-based math learning, namely how to understand a mathematical concept based on contextual issues that arise in Sundanese culture. This study fits the idea d'ambrosio (Shirley, 1995) that the teaching of mathematics for everyone should be adapted to the culture.

METHOD

The method in this research is exploratory with an ethnographic approach. Explorative method is a method used to find, explore and find a symptom or event by conducting an assessment of the symptoms (Gulo, 2000). While the approach of ethnography, is a research approach with the involvement of researchers in the association Sunda among the sites selected (Spradly in Muzdalipah & Yulianto, 2005). The location of this research is Kampung Cigandol, Sukasetia Village, District Cisayong, Tasikmalaya. Geographically, the location of selected research is located on tribal Galunggung. In the history of Sunda, Galunggung is the name of a small kingdom that was formerly part of the Sunda kingdom. Galunggung the Sunda royal *ancestor* who became one of the forerunner of the birth of Tasikmalaya Regency.

The focus of this research is etnomatematika Sunda in relation to *culture* Sunda in activity; estimate, making patterns and measure. *People* Sundanese referring to the studied subject who behave *nyunda* and generally inhabit the township.*Nyunda* behavior is reflected in the figures selected as informants reflect the observed behavior of Sunda. To get comprehensive data on the focus of the study examined, d ata collected through two stages: (1) observation, namely: observing the behavior and habits of the Sundanese (including the creation of the Sundanese) in

assessing activities, making patterns and measure; (2) interview, namely: conduct interviews with community leaders or traditional Sundanese. After the data is collected, and then do the tabulation of data to look at the symptoms of mathematical intentionally or unintentionally done by people Sundanese. The results of the tabulation of data is further analyzed to see how behaviors Sundanese practice mathematics and mathematical concepts what is practiced in the daily life of the Sundanese.

RESULTS AND DISCUSSION

Etnomatematika in this study focused on the activities of the Sundanese people in their daily activities: assess, create patterns, and measure. The potential of these three activities etnomatematika first tabulated in the form of descriptions of observations of behavior or habits of the Sundanese people based on each activity was observed. The results of this observation later confirmed through interviews ditranskipkan and then tabulated back into supporting data. Description observations and interviews is more fully described in the following description.

DescriptionEtnomatematikaSundanese

Description etnomatematika *Sundanese* apparent from the following activities.

estimate

Assess is an activity that many *people* do Sunda. Usually *people* use activities estimate Sunda to bid on an object or goods; heavy objects, land area, or volume of a particular object. If estimates one or slip far below the actual size, the risk of the Estimator will suffer losses. One measure used to estimate the *person* Sunda is *cubical.Cubical* volume is a unit of measure used to estimate the wood pile, the pile of rocks, sand volume and so on.

Gambar 1. Kayu balok

Gambar 2. Kayu Albasiah di Kebun

Gambar 3. Gundukan Batu

An interview following describes the use of *cubical* in everyday *people* Sunda (P = researcher, and T = figures):

………………………………………………..

P : Upami *kibik* dianggona kana naon, Pa?

T : [Sambil duduk di atas *jojodog*] Tah, ayeuna misalna tihang [maksudnya: kayu balok] 2 m; panjang 2 m, congona 10 senti.

P : Maksadna 10 senti teh kumaha? [Sambil menggambarkan sketsa kayu balok di atas kertas], Kadieu 10 senti, kadieu 10 senti [Menunjukkan ukuran tinggi 10 cm, lebar 10 cm].

T : Enya kitu! [Sambil menoleh, kemudian menunjuk pada gambar]

P : Teras kumaha?

T : Nya, nu disebut sakibik teh 50 tihang!

P : Maksadna? [Masih bingung]

T : Nya, 100 meter. 50 x 2 [Sambil menjelaskan]. Jadi, lamun 3 m berarti $33\frac{1}{2}$.

P : $33\frac{1}{3}$ panginten.

T : Dibuleudkeun, biasana $33\frac{1}{2}$.

P : Teras, pami naksir kai di kebon, carana kumaha?

T : Tah, lamun naksir kai, tingal jangkungna sabaraha, buleudna [maksudnya: keliling kayu] sabaraha. Misalna jangkungna ditaksir 5 meter, buleudna 50 cm.

P : Cara ngukur buleudna, kumaha?

T : Eh…., gunakeun tali atuh?

P : Teras?

T : Ditaksir nu 2 meter, 10 siki?

P : Nu 3 meter, 10 siki? [Memotong kalimat]

T : Moal mungkin, da congona, paling ge aya kana 5 siki? Jadi, kabeh lobana kur 35 siki, teu sakibik-kibik acan.

P : Oh, kitu!

T : Tapi kade, da kanyataanana mah teu 10 senti, 8 senti, tah nu asli mah 10 senti.

P : Atuh rugi meureun.

T : Makana, dina jual meuli kai mah orang kudu bisa naksir sahandapeun anu diitung ku orang.

P : Pami ngitung batu kumaha?

T : Lamun dina batu mah, itung gundukanana, misalna panjang 2 meter, kaluhurna 50 senti.

P : Carana! [Sambil mencoba menggambar balok yang tinggi dan lebarnya sama]

T : Tah kadieu 50 senti, kadieu 2 meter, jadi sakibik. [Sambil menunjuk pada gambar]

………………………………………………

……………………………………………

Sundanese *people* use the term *cubical* seems to get 100. The use of numbers 1 *cubical(Sakibik)* may be used to summarize or mempraktiskan calculations. In an interview that appears to determine the volume of logs; 1 cubical = 50 x 2 m = 100 m or 1 cubic = 33x 3 m = 100.5 m or close to 100 m. Similarly, the stone 2 x 50 = 100. In addition, *the* Sunda also good estimate (estimate), using estimated high or low estimates so the opportunity to get the loss in buying and selling can be minimized.

Creating Patterns

In contrast to the estimate, making the pattern used by *the* Sunda in activities that require precision. Making activity pattern widely used by *people* Sunda when making bamboo handicrafts typical of Sunda land, such as: *dudukuy, Aseupan, hihid, sieve, nyiru, boboko, tampir, telebug, tolomong, ...* and so on. This activity is a legacy of *the ancestor* who still preserved.

Figure 4. Some Bamboo Typical Tatar Sunda*(boboko, nyiru, Aseupan, sieves, hihid,*and*Besek)*

In particular pattern of activity to make bamboo handicrafts, *people* Sunda recognize the term *pihuntuan.* This term refers to *a benchmark* or initial pattern used by *the* Sunda for mengkonstuksi a form. Uniquely, this *pihuntuan* determines the next pattern or shape desired. So, if this *pihuntuan* wrong, it can be ascertained that the pattern will then be wrong or even will not achieve the desired shape. Here are excerpts of an interview with the figures that describe *pihuntuan.*

……………………………….

P : Pami nyieun karajinan [Maksudnya: produk hasil kerajinan Sunda, seperti: nyiru, hihid, ayakan, boboko, dan sebagainya] kumaha, Pa?

T : Lamun genep, angkat tilu. [Sambil mengangkat jari-jari tangan kiri ditambah ibu jari tangan kanan, lalu mengangkat jari tengah, jari telunjuk, dan ibu jari tangan kiri. Dilakukan secara spontan]

P : Teu kahartos, maksadna kumaha?

T : Eh…, ieu geura contona [sambil mengambil boboko]. Tah ieu pihuntuanana anu genep.

P : Nu mana, Pa? [sambil melihat boboko]

T : Tingali tengah-tengahna, anu mola kaditu kadieu, tah ieu? [sambil menunjuk pada pihuntuan]. Sok geura itung, hiji, dua, tilu, opat, lima, genep. [Menghitung tiap pelapah bambu yang dijadikan pihuntuan]

P : Aya kahandap, tah nu ieu mah [sambil menunjuk pola], nu ieu kaluhur [sambil menunjuk pola sebelahnya]

T : Enya, tah gening, nu kenca kahandap tilu, handapeunana dua kahandap, terus kahandap hiji. Nu katuhu, kaluhur tilu, terus kaluhur dua, jeung kaluhur hiji.Sarua eta teh kaditu-kadieu oge ngan sabaliknya. [Memperlihatkan pola yang disebutkan]

P : Geuning tah kahandapna, kahandap dua, kahandap hiji, kaluhur dua, kaluhur. [Sambil menunjuk pihuntuan sebelah kiri].Jadi teu pararuguh polana.

T : Macana ulah dibalikeun, lieur. Tujuanana ngarah ngepang tangtung.

P : Naon ari ngepang tangtung, teh?

T : Enya, tah kawas kieu [Sambil menunjuk pada pola]. Tah, fungsina pihuntuan ieu keur nyusun juru opat anu ieu [Sambil memperlihatkan keempat juru boboko]. Kahade beda jeung nyieun ayakan.

P : Naon bedana kitu, Pa?

T : Bedana dina nangtukeun pihuntuan, geura titenan ieu [Memperlihatkan sebuah ayakan]. Ieu mah pihuntuanana aya tilu, molana ti tengah ieu [Sambil menunjuk pusat pola yang ada di tengah]. Tah geuning, kaluhur hiji, kaluhur tilu, kahandap hiji, kahandap tilu, ….jeung saterusna.

P : Oh…. kitu.

T : Kahade, beda geura, lamun pihuntuanana genep, bisa nyusun juru opat. Jadi anu pihuntuanana genep bisa nyieun kojong, boboko, telebuk, tolomong.Anu pihuntuanana tilu, bisa nyusun juru hiji jeung anu buleud, aseupan, ayakan, tampir, nyiru.

P : Geuning ari hihid pihuntuanana tilu [Sambil menunjuk pada hidid].

T : Apanan juru hiji, tah mimitina ti dieu [Sambil menunjuk pada sudut hihid], terus dilepekeun jadi wae bisa pasagi.

P : Naha nya, bisa kitu, aneh!

T : Tos ti dituna kitu, ti karuhuna.

………………………………………………

Based on excerpts of the interview above, it appears that when *people* Sunda dealing with very tight pattern at all. *People* Sunda not be playful or use an estimate because the consequences would be fatal once. Note the picture *pihuntuan* (benchmark) which form a pattern *interpreter four* (top four) and pattern *interpreter Hiji* (corner Hiji) and pattern *anu buleud* (in a circle) below.
Figure 5.*Pihuntuan* six that produces patterns *interpreter Opat*

Pihuntuan six numbers determine *kahandap* (down): 3, 2, 1, is in a position to the left of center; The next row; *kaluhur* (above): 2, 1; *kahandap* (down): 2, 1; *kaluhur* (above): 2, 1; .... etc. The position of the right and front positions are opposite.
Figure 6.*Pihuntuan* three that produce *interpretersHiji* and patterns *buleu*

Pihuntuan produce a pattern of three consecutive numbers *kaluhur* (above): 1, 3; *kahandap* (down): 1, 3; *kaluhur* (above): 1, 3; *kahandap* (down); 1, 3 ... and so on. For *interpreter Hiji* (corner one), such as: *Aseupan* (shaped like a cone), from a central point with three turns leaving *pihuntuanpihuntuan* three lanes. Most likely, this *pihuntuan* pathway,

which then formulated construction cones, which basically terkontruksi of lines and line diameter circle artist. For *buleud* pattern (round / circle), *pihuntuan* path of the central point was to make a line perpendicular to each other. *Pihuntuan* path length from the central point to the edge of the circle (the term *wengku),* equal in length. Thus, it is not surprising if there are (not all) *nyirusieve-shaped* or hemispherical with *pihuntuan* path of the central point is equal to a quarter of the circumference of the ball.

One more thing is the uniqueness found in both kinds of construction geometry *pihuntuan* above.Although the stages of webbing on both *pihuntuan*above is different, but the observation of the patternformed*ngepang tangtung*appearsquare patternedrowspread, both in*pihuntuanpihuntuan*six andthree.The pattern is not apparent and hard to identify (limited number of researchers) limits, because it can only be observed at a certain distance.

Measure

Measuring a mathematical activity that can not be separated from everyday life *people* Sunda. Many terms that appear with these activities;unit length *(sadepa,sapal,sahasta,sameter, sajengkal, satampah, Sadim,...* and so on), unit area*(sabata, sahektar, satumbak, saelo, saicak, sabau, ...*and so on), unit volume *(sakibik, sadam, sakojong , satelebug,...* and so on).In addition to the terms that it has become an international force,*the*Sunda usually use the names of objects used to measure (for example: *sakojong*= one *kojong,* because objects that are used as a measuring tool is *kojong).*

Among a number of terms above, there is a term measure commonly used to measure the area of land, rice fields, namely: brick.In connection with this measure,*the*Sunda has a unique term, namely: *measures one.* So *measures one* for *the* Sunda identical to measure the rice field, or a particular land area.

Sunda *measures one* for *people* is to determine how the brick area of land he owned. *Sabata* value is 14 m^{2}or more precisely14m^2·If this land will be bought and sold, then the brick size determines the price of land to be agreed through bargaining.

There is a mathematical concept that is usedas the basis for determining the size of a brick, namely: the concept *pasagi brackets. Pasagi* termmay be synonymous with square *brackets,* but to calculate the area *pasagi* these *brackets, the* Sunda determine this by multiplying the length x width.The concept length x width determines the general perception *of people* Sunda in calculating the land area in units of brick.

The following excerpts from interviews reveal how *people* Sunda measure the land area with brick unit.

....

P : Cik Pa, ari sabata teh sakumaha?

T : Sabata sarua jeung opat welas meter pasagi. Tapi, sabenerna mah saratus pertujuh. Jadi, lamun boga sawah saratus meter pasagi sarua jeung tujuh bata.

Lamun genep ratus meter, opat puluh dua bata [600 meter maksudnya 600 m2].

P : Ari cara ngitungna kumaha? Misalna rek ngukur model kieu [Membuat dan menunjukkan gambar persegi dengan sisi = 20 meter].

T : Kari ngitung, panjangna dua puluh meter, lebarnya dua puluh meter; berarti panjang kali lebar, opat ratus meter pasagi. Opat kali tujuh sabaraha? [Sambil bertanya ke peneliti]

P : Dua puluh dalapan.

T : Tah sakitu, dua puluh dalapan bata.

P : Kumaha lamun modelnya kieu? [Menggambar segitiga sebarang dengan sisi-sisinya masing-masing 40 m, 60 m, dan 70]

T : Jumlahkeun, tujuh puluh tambah genep puluh sabaraha? [Bertanya ke peneliti]

P : Saratus tilu puluh.

T : Bagi dua, nu ieu ge bagi dua [Sambil menunjuk angka 40], terus kalikeun, jadi sabaraha? [Kembali bertanya kepada peneliti]

P : Sarebu tilu ratus.

T : Kalikeun tujuh, jadi salapan puluh hiji bata [13 x 7 = 91].

P : Naha, Pa, nu dijumlahkeunana nu ieu jeung nu ieu, heunteu nu ieu jeung nu ieu atawa nu ieu jeung nu ieu? [Sambil menunjuk pada bilangan 60 dan 40; kemudian bilangan 70 dan 40]

T : Ah, kitu wae. [Tidak memberikan penjelasan]

P : Kumaha lamun nu ieu? [Menggambar segiempat sebarang dengan sisi-sisi yang berhadapan masing-masing 3 m dan 5 m serta 6 m dan 8 m]

T : Nu kitu mah kudu direncah.

P : Naha, heunteu kawas cara tadi? [Maksudnya cara seperti menghitung luas tanah berbentuk segitiga sebarang]

T : Bisa wae, sok geura itung, lima tambah tilu bagi dua, terus genep tambah dalapan bagi dua sabaraha?

P : Dua puluh dalapan.

T : Kalikeun tujuh berati menang sabata salapan genep [0,28 x 7 = 1,96]

P : Naha, carana bisa kitu?

T : Ih… coba wae, misalkeun bentukna tah model kieu [Sambil menggambar persegi panjang], kadieu tilu puluh sarua jeung nu ieu [Menunjuk pada ukuran panjang], sabelahna dua puluh sarua jeung nu ieu [Menunjuk pada ukuran lebar]. Tilu puluh tambah tilu puluh bagi dua, nu ieu, dua puluh tambah dua puluh bagi dua, jadi, genep ratus, opat puluh dua bata.

P : Lamun bentukna kieu [Menggambar bentuk kurva tertutup sederhana].

T : Direncah eta mah, bisa dibagi tilu, opat, lima, …Tah nu hese mah lamun bentuknya buleud.

P : Carana?

T : Dikurilingkeun ku tambang, terus dipasagikeun.

………………………………………………

….

As with other units of measure, unit actually has a *brick* raw conversion value, namely, m ^{2}. Even with that number, *the* Sunda seem to have a constant figure 7. For example, to declare 700 m ^{2}, simply multiply 7 x 7 = 49 bricks. Actual calculation is (700 m ^{2}x) Bricks = 49 bricks. Thus, the term *brick* appears only for the purpose of conversion.

Unit *brick,* as is revealed in the interview above, a unit area. To find the area of a field or fields, *people* Sunda based on the square or rectangular shape, any form of land or fields. Perceptually, *the* Sunda considers that whatever the form of a land essentially be formed into a square or rectangle. In this case, it turns out *people* Sunda has known and long used the concept of approximation or approximation.

In addition to the concept of approximation, *the* Sunda is also committed to the principles of connectivity with mathematical concepts previously understood. To transform the shape of certain land into square or rectangular shapes are used the following approach.

$$p \ x \ l = \frac{p+p}{2} x \frac{l+l}{2} = \frac{2p}{2} x \frac{2l}{2}$$

for p = length and l =width.

Person Sunda may not be aware that such cases occur because of the position and the length and width of a square or rectangle of the same length. If it is stated that each pair of different length and width, for example P_1, P_2 or l_1, l_2, then

$$p \ x \ l \neq \frac{p_1+p_2}{2} x \frac{l_1+l_2}{2}$$

Attempts to generalize may have existed in the minds *of people* Sunda, but has not reached the appropriate logic.

Discussion

Activities of *the* Sunda estimating, create patterns, and measure illustrates that there has long been a mathematical activity and hereditary nature. This activity is so embedded in our daily lives and cultural in nature, both in the context that consciously or unconsciously. Some of the activities carried *people* Sunda seems to really apply mathematical concepts, such as: unit conversion *cubical* in assessing,

estimating unit conversion and the use of *brick* in the formula length x width to determine the extent of a particular land. In addition, there are also activities that may develop mathematical concepts, such as in the context of pattern formation *pihuntuan*.

In principle, the basic terms of measurement used *the* Sunda, such as: *cubical* and *brick* has strict rules. Tight both measures can be explained as follows.

- 1 cubical, valued with 50 wooden poles (each length of 2 m; square-shaped end with a side length of 10 cm). Thus, the timber is shaped beams with each area of the base = 100 cm ^{2}. Due to the length of 2 m = 200 cm, the volume of 1 cm ^{2} poles = 100 x 200 cm = 20,000 cm^3. Thus, 1 cubic = 50 x 20,000 cm^3 = 1000.000 cm^3 = 1 m^3. When the pole 3 m long, a lot of wood 33, Meaning, one cubical = 33 x 30.000 cm^3 = 1000.000 cm ^{3} = 1 m ^{3}.

- 1 brick = 14m ^{2} means that for 100 m ^{2} = (100: 14) = 7 brick (bata).

By looking stringency in the use of both terms of these measurements, it seems *people* Sunda use the terms to replace a similar term. The goal is nothing else bar angkali for practical value, in terms of addressing and also its usage. For example the use of cubical in *assessing* activities, generally wood poles for house building measuring 2 m, 3 m, 4 m and 5 m with a square-shaped plate measuring 10 cm x 10 cm. So, if there are 25 pieces of wooden poles with a length of 5 m, it is easy to guess that the volume of the entire timber is one quarter of a cubical. *People* Sunda clever estimate using cubical units are typically good a jug in bargaining, when buying timber remained in the forest with a contract system.

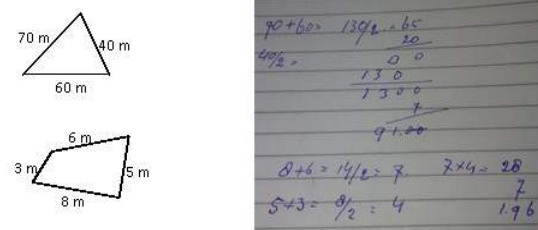
Then, why in the measurement using the term brick, *person* Sunda ignore accuracy. Try concern, depending on the calculation of how one of the characters Sunda in determining the land area with brick unit when compared with the mathematical concepts used.


Figure 7. A Model Calculation Results One Sunda in Determining Land

Let us compare the results using a formula Heron and Brahmagupta (Posamentier & Stepelman, 1990), as follows.

- Suppose a = 40 m, b = 60 m, and c = 70 m, with s = ½(40+60+70) m = 85 m,thearea of the triangle is

$$L = \sqrt{s(s-a)(s-b)(s-c)} = \sqrt{85.45.25.15} = \sqrt{1.434.375} = 1197,65$$

In units of brick, 1197.65 x brick = 83.84 brick.

- Suppose a = 3 m, b = 6 m, c = 5 m and d = 8 m, with s = ½(3+6+5) = 11 m, the area of the quadrilateral is

$$L = \sqrt{(s-a)(s-b)(s-c)(s-d)} = \sqrt{8.5.6.3} = \sqrt{720} = 26,83$$

m2

Be converted into units of brick, 26.83 x brick = 1.88 brick

It seems that there are very significant differences in outcomes between the calculation results with mathematical concept Sunda figures are already known. Nevertheless, *the* Sunda actually can use the concept of partitioning that may result will not be much different. Thus the concept of partitioning into the shape of a square or rectangular acceptable mathematically (we say in the transformation of perceptual), but for a transformation in the form of mathematical equations can not be accepted, because the generalization wrong.

In contrast to the estimating and measuring activities, activities create patterns can be considered as the full and very strict rules. Tightness in activities to make the pattern set by *pihuntuan* as the basic construction of a form. The pattern of 3-2-1 with six *pihuntuan* kontuksi *interpreter* is four, while the pattern is 1-3 with *pihuntuan* three kontuksi *interpreter* one and circles. Kontuksi one *interpreter,interpreter* of four, and the next ring set by the central point *pihuntuan* that form pathways *pihuntuan.Interpreterpihuntuan* one has three lanes, four *interpreters* have four *pihuntuan* lines, and circles also have four lanes *pihuntuan*.

When observed more closely, *pihuntuan* path has several functions: (1) forming a circular pattern *(sifter, nyiru,Aseupan),* (2) forming a symmetrical *braids tangtung* (present in all webbing). Both of these functions according to the opinion of researchers have close linkages with mathematical concepts. Generally *sieve* and *nyiru* parabolic, so that the path in both woven *pihuntuan* seems easily traced with parabolic equation. So also in *Aseupan,* because *Aseupan* generally conical, then the path *pihuntuan* easily traced to the concept of a cone (line *pihuntuan* painter is the line on the cone).

As with the *tangtung braid* pattern is formed. *Tangtung braid* pattern turned out to construct various geometric patterns. One geometric pattern observed is a row of square terkontruksi are divergent. This geometric pattern is quite difficult to detect because it can only be observed at a certain distance (need to search further).

What was done by *the* Sundanese of the three activities above is actually only a small part of the Sundanese culture which is very viscous with a mathematical activity. Regardless of whether a mathematical concepts are strictly applied by *the* Sundanese, various cultural activities Sunda fact be inspired understanding of mathematical concepts that already exist as well as the development of mathematical concepts that may still need to explore further. In other words, Sundanese culture is the inspiration that can be used as an alternative source of learning for a different mathematical understanding.

CONCLUSIONS AND SUGGESTIONS
Conclusion

Based on the findings and the focus of the proposed research, the following conclusions can be delivered: a) *People* Sunda perform mathematical activities based on practical value inherent in everyday Sundanese culture. This is reflected in the activity of assessing and constructing measures based culture that has been handed down or based on objects that are used to measure activity; b) For the basic concepts of size and pattern-making activities, *the* Sunda apply mathematical concepts are very strict. Knowledge application partitions on basic concepts of size and pattern *pihuntuan* constructing certain geometric patterns really menginpirasi application and development of mathematical concepts were amazing. However, for the application of mathematical concepts in relation to mathematical concepts previously understood not meet a rule of thumbs mathematical agreed (visible from how to make generalizations are false).

Suggestion

Some suggestions can be delivered on the above conclusions; a) In relation to etnomatematis based learning, Sunda etnomatematika can be used as a learning resource or materials for the development of learning tools; b) Some etnomatematika Sunda in this study requires further investigation, but because there is a lot of information is lost, the study in the context of historical phenomenology may be necessary.

IMPLEMENTATION OF TEACHING USING CURRICULUM 2013 IN SCIENCE SUBJECT FOR THE ELEMENTARY SCHOOL AT BLITAR CITY

Sukamti; Esti Untari

State University of Malang, Indonesia

E-mail: kamti.pgsd@gmail.com

ABSTRACT

The implementation of Curriculum 2013 in the elementary school level in Blitar City started in 2013. The purposes of this research are to 1) examine the implementation of teaching science subject in elementary school in Blitar City and 2) find out the problems met in teaching the mentioned subject in elementary school in Blitar City. The method used is descriptive qualitative. The data collected through observation, interview, literature, and documentation. The sampling collection adapted snowball sampling technique. The sample taken are for higher-classes of elementary school level in four school in Blitar City. The data analyzed through triangulation, data reduction, presentation of the data, and conclusion. According to the research, the teaching of science subject in elementary school using Curriculum 2013 demand experimental activity. The character reflected during the implementation of the teaching met the curriculum demand. The teacher's competence and class' facility indeed affected the teaching and learning process. However, teachers have to adjust the scoring and the teaching material difference between the teacher's book and students' book.

Keywords: teaching and learning science for elementary school, Curriculum 2013, higher classes of elementary school

In the world of education, curriculum is a planned of teaching and learning which includes guidance and instruction on type, scope, order of the contents, and the process of teaching and learning. In the 2013, The Ministry of Education and Culture has done the revision of the curriculum, from school-based curriculum (Kurikulum Tingkat Satuan Pendidikan) into Curriculum 2013 or national curriculum. The shift of curriculum called out pros and cons from the teachers. The pro-side teachers said that the new curriculum demand the students to be more creative and independent. In the other hand, the curriculum also criticized for combining several subjects, which leads to less focused materials.

Curriculum 2013 is the further development of competence-based curriculum and school-based curriculum that integrating character, cognitive, skills, and students' competence at once. This curriculum has been implemented step-by-step since academic year of 2013/2014 locally in appointed schools. At first, the curriculum is implemented only for grade I and IV of elementary school. However, as the time goes, the government instructed the implementation for all grades in elementary school.

Curriculum 2013 for elementary school level, according to Minister of Education and Culture's Regulation Number 22 Year 2016 on standard of process, said that the teaching and learning process ought to be done in interactive, inspiring, fun, challenging, and motivating manner. Besides, it is ought to give enough room for initiative, creativity, and independency according to the students' talent and interests, also the physical and psychological development of the students. The approach brought in the teaching and learning process including scientific, integrated thematic (intercourses thematic), and thematic (within a single subject). The learning models that needed to be carried out including inquiry learning, discovery learning, project-based learning, and problem-based learning.

The teaching and learning of science subject, in Curriculum 2013 particularly, is done in integrated way through various themes. Science subject accentuates on how the students learn and how the learning affects the students' cognitive development. The process of learning and teaching the aforementioned subject also demand

students' activity; both physical and mental, focus on students' interest as well as their experience in daily life. The teaching of science subject in elementary school has three main purposes: develop students' scientific-related skill, perceive the concept of science, and develop characters related to the subject itself.

The implementation of Curriculum 2013 in elementary schools in Blitar City started in 2013. As models for the implementation, the government appointed 14 public elementary school; several Islamic elementary school, both public and private. Regarding the aforementioned matter, the researcher would like to determine the implementation of the science subject teaching and learning in elementary schools in Blitar City. The focus of the study is describing and finding out the handicap and problems in the implementation of the teaching and learning process in the elementary schools in Blitar City.

METHOD

In this study, the research use the descriptive qualitative approach. It refers to descriptive research which emphasizes the use of analysis of process and meanings. The approach started from in-field observation in real-life situation, not relied on the theory at first. This research is done to describe a process of teaching and learning process on real-life situation as a reference to determine the weakness of the practice as a base for suggestion and revision; analyze facts, evidences, and circumstances happened during the teaching and learning process; conclude hypothesis related to the principles and concept of education, based on the data and information. The data and information collected from the in-field then will be drawn into meanings and concepts through descriptive analytic explanation, without using numerical data, since it emphasizes on the process.

The subject of the study are teachers of grade IV, V, and VI of model schools for Curriculum 2013 in Biltar City; including SD Bendogerit I, SD Sentul I, MI Perwanida dan MI Negeri Gedog. The study has been completed in August–October 2016. The sampling in this research is done using snowball sampling. Snowball sampling is a method in sample-taking from a population. The aforementioned method is included in non-probability sampling technique, in which the sampling has uneven probabilities. This

method is specifically employed for collecting subjective data from the respondents/sample which may representing the community or in other words, the sample of the object is rare and agglomerate in a specific group. Snowball sampling is a multilevel sample-taking method.

The data collection is being done through observation and documentation during the teaching and learning of science subject in particular themes. Besides, the researcher also collected the data through interviews and questionnaire, in order to determine the problems during the teaching and learning process. Lesson plans also collected as a part of written data.

The data then analyzed using triangulation technique. This technique is employed to check the validity of the data collected in the observation stage, then supported with interviews to enrich the data. The researched performed the validation by utilized the data source. Triangulation with source means comparing and double-checking the validity towards the collected data.

RESULTS AND DISCUSSION
Results
The result of teaching and learning observation
SD NegeriBendogerit 1

This school is located in Jalan Hasanudin Blitar. The implementation of Curriculum 2013 started in the academic year 2013, since the school was appointed as a model school. The observation was done on grade V and VI. Grade V consists of 34 students, while grade VI consists of 23 students. In grade V, the classroom set allows the students to discuss with the others, in group of 3–5 students. Meanwhile, the classroom setting for grade VI doesn't designed for group work. The class teacher for grade V is Ms. FebriyanHerwanti, SPd, 34 years old. She has been teaching for 12 years. The teacher for grade VI named Ms. RetnoWidyastuti, SPd, 44 years old. She has been teaching for 18 years.

The teaching and learning done in grade V demanded the students to actively participate in the process –from answering teacher's questions; seeking information needed from books, internet, or through group discussion. The teacher started the class by calling out apperception about water cycle. Then, the teacher divided the class into several groups by handed out them cards

with several name of fruits. The teacher then gave worksheet that should be done through the discussion. The students were actively participated in this activity.

Meanwhile, the teaching and learning implementation done in grade VI started with questions and answers session, regarding the material discussed in previous meeting. The theme for the grade VI was plants adaptations. For the next stage, the teacher allowed the students to have group discussion while completed the worksheet. The students then asked to observe the plants in the school yard, followed with worksheet presentation. The students assigned to list the plants adaptation based on their observation, followed with class discussion.

SD Negeri Sentul 1

This school is located in Jalan Trowulan 2 Blitar. The implementation of Curriculum 2013 started in the academic year 2013, since the school was appointed as a model school. The observation was done on grade V and VI. Grade V consists of 34 students, while grade VI consists of 32 students. Both classrooms set allows the students to have discuss with the others, in group of 3–5 students. The class teacher for grade V is Ms. Siti Fatimah, SPd, 31 years old. She has been teaching for 8 years. The teacher for grade VI named Ms. Dra. Komsatun, 57 years old. She has been teaching for 37 years.

The teaching and learning process in grade V started with the teacher's questions on functions of water, particularly on making simple water filter. The students had assigned to bring the material for practice on the previous meeting. Each group presented their result on filtering the soiled water using recycled water bottle and several materials as mentioned on students' worksheet. Then, the other groups/students observed, followed with questions and answers session. The teacher facilitated and managed the students during these activities.

Teaching and learning process in grade VI, the teacher started the class with questions and answers related to the electronic devices that she brought in the class. The theme of the meeting was electricity. The teacher's intonation was clear, thus helped the students to get more concentrated. The teacher called out the students' enthusiasm well. Then, the teachers continued it with the material in the worksheet, followed with the discussions.

After that, the students did the practice in making simple electric circuit using cable, lamps, and batteries. The teacher guided the students in every activity. When the practice finished, each group was asked to explain their practice results in class discussion.

MI Negeri Gedog

MI Negeri Gedog is located in Jalan Pemuda Blitar. The implementation of Curriculum 2013 started in the academic year 2014. The observation was done on grade IV and V. Grade IV consists of 38 students, while grade V consists of 29 students. In grade IV, the classroom doesn't designed for group work. Meanwhile, the classroom setting for grade V is shaped U. The class teacher for grade IV is Ms. NikmatusSholikhah, SPd, 45 years old. She has been teaching in the aforementioned school for 21 years. The teacher for grade VI named Ms. Susi Ariani, SPd, 37 years old. She has been teaching in the aforementioned school for 6 years.

The teaching and learning process in the grade IV started with the questions and answers related to the source of the energy. The theme is the source of alternative energy. The students were assigned to bring the materials for the practice. The teacher gave example in practice using potato. Then, the class was divided into several groups to make the similar practice, as explained by the teacher. The students then arranged the cable and connected it with the potatoes, followed with group presentation. After that, the students had to make the practice report.

The teaching and learning process in grade V started with question and answer related to electricity. The theme of the meeting was electric circuit. The teacher handed worksheet for that day's activities. The students were asked to make series and parallel electric circuit by themselves, as the teacher supervised during the practice. After that, the students completed the sheet, followed with checking.

MI Perwanida

MI Perwanida is located in Jalan Sultan Agung no. 92 Blitar. The implementation of Curriculum 2013 started in the academic year 2013. The observation was done on grade IV and V. Grade IV consists of 33 students, while grade V consists of 29 students. In grade IV, the seat arrangement doesn't designed for group work. Meanwhile, the seat arrangement for grade V shaped U.The class teacher for grade IV is Mr. Aziz

Ahmad, SSos, 41 years old. She has been teaching for 13 years. The teacher for grade V named Ms. TrihandayaniKhoiroh, SPdI, 32 years old. She has been teaching for 13 years.

The teaching and learning process started with the teacher's explanation. The theme was Sound. The teacher asked the students to shout in the school yard to practice the echo and resonance. The students were enthusiast during this stage. Then, the students were assigned to do the practice related to echo and resonance using simple materials that have been prepared. The students were actively participated during this stage, followed with reporting the practice and shared group discussion with the class.

In the grade V, the class started with the video on human skeleton, as it was the theme of the meeting. Then, the teacher divided the class into several groups to do the worksheet. Each group was presented by a spokesperson, while the rest of the group observe the others' works. The students were assigned to do questions and answers during the observation. Then, the teacher checked the groups' work, followed with giving rewards for the groups that do well during the meeting.

Interview
SD Bendogerit 1
The following was the interview between the researcher and teacher of grade V teacher, Ms. FebriyanHerwanti, SPd.
Interviewer: *What is the theme of science subject for grade V?*
Teacher: *The transformation of water and things. That is what I remember*
Interviewer: *Did you make your own lesson plan for each meeting in your class?*
Teacher: *The lesson plans were created and used during KKG (teacher working unit in teacher competence), but in the real-life practice, the lesson plan is developed according to the theme of the meeting.*
Interviewer: *In your opinion, what is the difference between science subject taught using school-based curriculum and Curriculum 2013 towards the students' development?*
Teacher: *In Curriculum 2013, the themes served as concept and not detailed; but the students are given the freedom to be creative, to ask questions without hesitate, and to seek information from various sources.*

Interviewer: *What is the model and method in teaching and learning used in Curriculum 2013, in particular science subject?*
Teacher: *Almost every model and method is used, as long as they match with the themes. If it doesn't match, I use quizzes, then I determine the probably matching method that will be easily grasp by the students.*
Interviewer: *Did you find problem during the implementation of teaching and learning using Curriculum 2013, science subject in particular?*
Teacher: *I think so. I like using the current curriculum (Curriculum 2013). But for the scoring, I thought it will be better if we have standardized rubric or application. During the first year (of the implementation), the scoring rubric was still manually done and the format was ever-changing*
Interviewer: *Did you have any critics or suggestion toward the science subject's material in Curriculum 2013, so far?*
Teacher: *Both of the teacher and students' books are hard to understand. It will be easier for the young and innovative teacher. But, if the teacher has less motivation and innovation, the scope of teaching and learning will be too small. Besides, if we refer to the core competency, the theme can be too wide. Thus, I use the school-based curriculum book as guidance. I've experience while my students participated in science Olympiad. They had difficulties in taking the tasks, since they learned the concept well, yet lacking in the practice. The material won't be covered if the teacher only acts as a director or supervisor during the teaching and learning process.*

SD Sentul 1
The following was the interview between the researcher and teacher of grade VI teacher, Ms. Dra. Komsatun.
Interviewer: *What is the theme of science subject for grade VI?*
Teacher: *The reproduction of plants, electricity, and solar system*
Interviewer: *Did you make your own lesson plan for each meeting in your class?*
Teacher: *The lesson plans that we use are according to KKG in district level, but the teachers are free to develop it according to their class' condition*
Interviewer: *In your opinion, what is the difference between science subject taught using school-based curriculum and Curriculum 2013 towards the students' development?*

Teacher: Therecent curriculum demands a lot of practices; while for the school-based curriculum, there are a lot of drilling.
Interviewer: What is the model and method in teaching and learning used in Curriculum 2013, in particular science subject?
Teacher: Practicum method is mainly used
Interviewer: Did you find problem during the implementation of teaching and learning using Curriculum 2013, science subject in particular?
Teacher: I don't think there is such problem since the Curriculum 2013 is exactly matched with science subject teaching and learning
Interviewer: Did you have any critics or suggestion toward the science subject's material in Curriculum 2013, so far?
Teacher: The material designed aren't detailed well.

MI Negeri Gedog

The following was the interview between the researcher and teacher of grade IV, Ms. NikmatusSholikhah, SPdI
Interviewer: What is the theme of science subject for grade IV?
Teacher: One of it was the alternative source of energy, including potato that we had in the class (during the observation); the use of wind energy, we made kites; and for the third sub-theme we only had alternative source of energy.
Interviewer: Did you make your own lesson plan for each meeting in your class?
Teacher: The lesson plans used are already made, but we are free to develop it.
Interviewer: In your opinion, what is the difference between science subject taught using school-based curriculum and Curriculum 2013 towards the students' development?
Teacher: For science subject, we have a lot of practices.
Interviewer: What is the model and method in teaching and learning used in Curriculum 2013, in particular science subject?
Teacher: In the previous meeting, we had demo or modeling. The teacher gave examples on the first hand. If the students were asked to do the practice without any modeling, they will be obviously confused. Besides, the teacher has to provide extra material for the practice.
Interviewer: Did you find problem during the implementation of teaching and learning using Curriculum 2013, science subject in particular?

Teacher: For me, it was the book. The book is constantly revised, yet I got the previous version. Thus I have to alter the material and compare it to the recent version or revision
Interviewer: Did you have any critics or suggestion toward the science subject's material in Curriculum 2013, so far?
Teacher: There is no standard guidance for the teaching and learning process. We got repeated theme. We met the alternative source of energy in theme two, sub-theme two and three. I asked my colleague, why it changed, since it was far from the previous theme (force and motion). We had force and gravity in previous lesson, but now there is none of the theme appeared. I don't know whether it is revised or changed due to the complexity of the material.

MI Perwanida

The following was the interview between the researcher and teacher of grade V teacher, Ms. TrihandayaniKhoiroh, SPdI.
Interviewer: What is the theme of science subject for grade IV?
Teacher: Skeleton, motion, and digestion system. Sorry, I don't really memorize the theme and material
Interviewer: Did you make your own lesson plan for each meeting in your class?
Teacher: The lesson plans used are already made, but we are free to develop and alter it.
Interviewer: In your opinion, what is the difference between science subject taught using school-based curriculum and Curriculum 2013 towards the students' development?
Teacher: In Curriculum 2013, the teacher has to master all subjects at once, so we had to study. I have Islamic teaching as my basic, but I had to teach several themes for grade V.
Interviewer: What is the model and method in teaching and learning used in Curriculum 2013, in particular science subject?
Teacher: Usually, I has group discussion. If there is a theme on animal, I bring the class to the Kebonrojo zoo to observe the animals there.
Interviewer: Did you find problem during the implementation of teaching and learning using Curriculum 2013, science subject in particular?
Teacher: The complexity in scoring, I think most of the teachers find it as the main problem
Interviewer: Did you have any critics or suggestion toward the science subject's material in Curriculum 2013, so far?

Teacher: *For the science subject, the material are less detailed, compared to the school-based curriculum. For the test and examination, we still did it per subject –not integrated as the curriculum demand.*

Discussion

The implementation of teaching and learning of science subject in higher-class

The Curriculum 2013 for elementary school is using integrated thematic teaching and learning. The stages of thematic teaching including choosing themes, integrating themes, designing lesson plan and carrying out the discussion. Based on the data collected in grade IV, V, and VI in four schools, each teacher has prepared and designed the lesson in form of lesson plans.

In the lesson plans made by the teachers, the lesson plan are made during the KKG (teacher working group) activities in each district. Each teacher considers the students' characters in the class they taught, since the lesson plans are developed according to the real-life condition.

According to the Regulation of Ministry of Education and Culture Number 22 Year 2016, the teaching and learning process is highly related to the graduate competency standard and standard of content. The teaching and learning using Curriculum 2013 employed scientific approach. Meanwhile, the teaching and learning model that needed to be carried out includinginquiry learning, discovery learning, project-based learning, and problem-based learning. Cooperative learning model can also be implemented, adjusted to the materials. According to the data collected, each teacher has implemented the scientific approach, including observing, questioning, experimenting, thinking, presenting, and creating; however it has not been done completely. The teachers have done the observing, questioning, and experimenting stages. Thus, the teaching and learning in the class has not been done according to the curriculum demand.

The implementation of teaching and learning of science subject for elementary schools demand the students to be actively participated during the process. The material for science subject in the aforementioned curriculum also demand practicum activity. One of them is the teaching and learning process done in MI NegeriGedog, with the theme alternative source of energy. During the practice, the teacher used potato as the substitute of battery, one of the electric sources. The students were assigned to make their own circuit using battery as the main source. In group, the students had to arrange the cables, potatoes, and lamps on their own. Several groups were managed to turn on the light using the simple electric circuit with potatoes as its main source of energy.

The teaching and learning of science subject in elementary school needs media to help the teacher deliver the lessons. Facility and infrastructure in each elementary school in Blitar City is also a factor that support the teaching and learning process. SDN Bendogerit 1, SDN Sentul 1, and MI Perwanida had have their own science labs. However, it is only functioned as the storage for teaching media. Meanwhile, MI NegeriGedog is yet to have their science lab.

Problems in the implementation of teaching and learning of science subject in higher-class of elementary school

According to the interview with the teachers, the main challenges of the implementation of Curriculum 2013 are the scoring and incompatibility of the material in the teacher's book and students' book. The scoring in the aforementioned curriculum demand the teacher to score the attitude, cognitive, and skill aspects; which appears as burden for the teacher since the number of students in the class are beyond the maximal number. According to the curriculum, the ideal number of students in each class is 28 students. Meanwhile, the sample schools has 28–35 students in each class.

The differences between materials in the teacher's book and students' book also became the problem in the implementation of teaching and learning. Thus, the teachers have to adapt and match the two books. However, to help delivering the material, the teacher needs to have the supporting materials. The teachers are expected to have supporting books and materials, aside from the government-prepared books.

CONCLUSION

According to the purposes, data, and data explanation, the implementation of teaching and learning of science subject using scientific approach, in general, has not been done completely. The science teaching and learning process are mostly done through practicum activities, since it demands the students to be more actively involved during the process. Besides, the material in science

subject in Curriculum 2013 are not well-detailed; it appears as basic concepts instead.

The teacher faced two main problems during the implementation of teaching and learning; including scoring and the differences between teacher's book and students' book. The scoring covers attitude, skill, and cognitive can be done properly if the class consists of 28 students or less. The teachers are also expected to be more creative in adapting and enriching the materials with the supporting books.

THE EFFECT OF CAI SDLMI METHOD TO EFL LEARNERS WITH AUTISM ON SPEAKING ABILITY

Alam Aji Putera; M. Adnan Latief; Ali Saukah; Sri Rachmajanti

Graduate Program in English Language Teaching, Universitas Negeri Malang

E-mail: alamajip2104@gmail.com

ABSTRACT

This study investigated the effects of CAI SDLMI (Computer-Assisted Instructions on Students' Knowledge of the Self-Determined Learning Model of Instruction and Disruptive Behavior) to the teaching and learning in EFL (English as Foreign Language) Class in Special Education Needs (SEN) school in their speaking ability. Two students (male and female) were give treatment using CAI SDLMI. The data of pre-test and post-test were compared to know the effect of the method. The result showed that the after treatment shows a better learning outcome. thus, CAI SDLMI may support the teaching and learning for EFL learners with autism in SEN School.

Keywords: effect, learners, autism, speaking.

CAI SDLMI (Computer-Assisted Instructions on Students' Knowledge of the Self-Determined Learning Model of Instruction and Disruptive Behavior) is a method developed to solve autistic students' problems in their behaviors. Mazzotti (2012) mention that CAI SDLMI is an effective format to teach students with disabilities to solve their behavior problems. SDLMI was usually taught using traditional instruction methods, such as teacher – directed small – group instruction (Fowler, 2008; Agran et al., 2006), on-on-one instruction at job sites (McGlashing-Johnson et al., 2004). A study by Agran et al., (2002) found that using the SDLMI to the middle school students with autism, intellectual disabilities, or multiple disabilities improved students' ability to self-set goals and reduced problem behaviors (i.e., inappropriate touching, not following directions).

Computer-assisted instruction (CAI) combined with SDLMI is one creative solution to handle the problems in learning. CAI SDLMI offers another interactive format for teaching goal setting and self-determination and could be used to present the SDLMI (Mazzotti, 2012). CAI offers an interactive format that can present multiple examples of content and provide immediate feedback on student performance (Hutcherson, Langone, Ayers, & Clees, 2004). CAI SDLMI is a creative solution to teach autistic students to improve their learning quality by employing self-regulated problem-solving strategies and to achieve self-selected goals. It consists of three phase: 1) set a goal; 2) make a plan; 3) adjust the goal.

The mystery is that the effect of CAI SDLMI in the English for Foreign Language (EFL) classroom for students with autism in their speaking ability is yet to be researched.

CAI SDLMI is quite a new method and invites curiosity to be applied to Autistic students in the teaching and learning process in EFL class. Research by Renee (2006) concluded that ESL learners with autism can acquire English as a second language. Research by Kurth (2012) mention that students with autism in inclusive and special schools should be given an appropriate method to teach English. Those researches suggest that an appropriate method should be given to autistic students in learning English. Students with autism have some problems in teaching and learning process in their communication and behavior. The impulsivity, lack of self-control, and aggressiveness that the students with disabilities showed may hinder their ability to participate in the activities that occur in the classroom (Kim, et al., 2012). As a result of their behavior problems, autistic students may unable to join any lesson in the current condition. However, with an appropriate method, the teaching and learning might be successful if we engage in the drawbacks of autistic students in learning.

This research tried to discover the effect of CAI SDLMI to students speaking ability in learning English. It is important that teacher involved with the student have a thorough knowledge of the student's form of expression and that they adjust their expectations for communication accordingly such as English teacher with autism knowledge. For students with limited oral expression, teachers and families should accept limited verbal attempts and nonverbal behavior as communicative. Even those students with autism who do have oral language may not add to their working oral vocabularies easily. Teachers and parents will need to teach new vocabulary in a variety of contexts and using a visually-based approach (Hunt, 1988). Students who rely on pictorial representations to

communicate will need to learn that a drawing or representation has a name and that it can give direction, or tell us what to do. Understanding this is essential if visual systems are going to provide meaningful communication. CAI SDLMI fits with those principles. The question of this study is what is the effect of CAI SDLMI to autistic students learning achievement in EFL class? This article will elaborate the method used, results, discussion, and conclusion of the effect using CAI SDLMI to speaking ability of the students in learning English.

METHOD

This research was carried out in 9th grade of junior level of Special Education Needs (SEN) School in Indonesia to know their speaking ability in English class. The autistic students learning together with other students. There were eight students involved; two of the students are autistic while the others are slow learner. One students is male and the other one is female. The students are autistic students in the category of verbal autism, HFA (High Functioning Autism), and in the moderate level of learning abilities. The students were taught English as their foreign language. Their students' first language is Indonesia, second language is Javanese, and they are learning English as their foreign language.

Students participated in the intervention for approximately 90 minutes each session per week (i.e., one week two session) with total of 5 sessions. Before the intervention the researcher do a pretest. After the interventions session had done, post-test were conducted to know the effect of the SDLMI Computer-assisted SDLMI. Students were trained on the steps of the intervention in the classroom of special needs' school. Specifically, students received step-by-step instructions about how to navigate through the CAI program and respond to the visual and audio components of the intervention. First, students watched the researcher demonstrate procedures. Second, students were given an opportunity to practice procedures with the researcher. Finally, students practiced procedures.

The intervention was presented in three parts. Intervention procedures included visual and audio components presented in the following sequence. For all three parts of the intervention, students completed worksheets on the computer. Part 1(set a goal) included three lessons: (a) Lesson 1, Identify Strengths and Needs, included describing what a goal is, identifying students' strengths and needs based on classroom expectations, and completing a

strengths and needs worksheet using Microsoft Word© 2007; (b) Lesson 2, Expected Behavior, included describing what a goal is, comparing current behavior to school/class expectations, providing examples of appropriate behavior, identifying barriers, and completing the behavior worksheet using Microsoft Word© 2007 and students are completing the speaking ability worksheet to communicate English for emergency purposes covering: 1) My name is…; 2) I am from Indonesia; 3) I need your help; 4) Can you take me to the police station; 5) I am lost; and (c) Lesson 3, SDLMI and Setting Behavior Goal, included "Where I am?" to "Where I want to be?," identifying what the student wanted to accomplish in terms of behavior, and completing a set a goal worksheet using Microsoft Word© 2007. Part 2 (make a plan) included three lessons: (a) Lesson 4, Problem Solving and Plan Development, included completing an interactive problem-solving activity, identifying barriers and solutions to meet goals, and completing a barriers worksheet using Microsoft Word© 2007; (b) Lesson 5, Identifying Supports to Achieve Goals, included supports for goal success, tools for achieving goal (e.g., cue cards, task analysis, self-monitoring checklist, student-directed worksheet), and student's self-selecting tool for success; and (c) Lesson 6, Finalize Plan Towards Goal, included identifying specific steps to meet the goal, providing supports required for meeting the goal, and developing a plan. Part 3 (adjust your goal) included two lessons, (a) Lesson 7, Self-Evaluation/Record Performance Data, providing students with information about their progress since the start of the SDLMI strategy, graphing progress toward their goal, providing reasons why progress was made toward the goal, students reviewing plans, and completing steps identified; and (b) Lesson 8, Adjust the Goal, included identifying whether the student's goal was met, identifying changes to student's goal if not met, providing examples of how and why changes may need to be made to the goal if the student was not making progress, and completing a goal revision worksheet using Microsoft Word© 2007.

A laptop computer equipped with Microsoft PowerPoint© and Microsoft Word© 2007 was used to facilitate the intervention. Many pictures to support the teaching and learning process were taken from google.com. LCD and audio speaker were used to support teaching and learning process. The experimenter investigated the students improvement in speaking ability by comparing the results of pre-test and post-test. To assess the students' speaking ability, the experimenter adapt scoring guide adapted from Djiwandono (2008) and scoring rubric fro O'Malley (2006). The scoring rubric aspects were speaking, fluency,

listening and pronunciation. Each of the aspect had 25% weighting and had 4 levels from poor, fair, good, and very good. In speaking aspect the classification were begins to name objects, begins to communicate personal and survival needs, begins to initiate conversation and asks to simple questions, and initiates and sustains conversation with descriptions and details. Fluency started with repeats words and phrases, speaks in single-word utterances and short patterns, speaks hesitantly because of rephrasing and searching for words, and speaks with occasional hesitation. Listening aspect consisted of understand little or no English, understand words and phrases but requires repetition, understand simple sentences in sustained conversation but requires repetition, and understand discussion with repetition or clarification. In pronunciation aspect the aspects were the speaker says little or no English, the speaker is mumbling, the speaker do not enunciate very clearly but understandable, and the speaker enunciate clearly.

RESULTS AND DISCUSSION
Results

The results showed that the aspect of speaking shows that both students were in classification of begins to name objects. In fluency, one student in classification of speaks in single-word utterances and short patterns, and one student in classification of speaks hesitantly because of rephrasing and searching for words. Listening aspect showed that both of students in classification of understands simple sentences in sustained conversation and requires repetition. And in pronunciation, both students in classification of the speaker did not enunciate very clearly but understandable.

In the posttest some of the students' aspects were increasing such as in speaking both of the students were increasing from classification of begin to name objects to begin to communicate personal and survival needs. In fluency aspect both of the students increased from speaks in single-word utterances and short patterns to speak hesitantly because of rephrasing and searching for words. In listening aspect there were no increasing classification, while in pronunciation aspect one student increased from the speaker is mumbling to the speaker did not enunciate very clearly but understandable.

Before treatment, students demonstrate unusual, distinctive behaviors, including restricted range of interests and preoccupation with one specific interest or object; inflexible adherence to a nonfunctional routine ;

stereotypic and repetitive motor mannerisms, such as hand flapping, finger flicking, rocking, spinning, walking on tiptoes, spinning objects; preoccupation with parts of objects; fascination with movement, such as the spinning of an object; insistence on sameness and resistance to change; unusual responses to sensory stimuli.

In addition, the students had challenging behaviors, such as aggression, destruction, screaming, self-injurious behaviors and/or tantrums. Given that the individual are not able to effectively communicate their thoughts and desires, it is not surprising that they rely on their behavior to communicate specific messages. For instance, a student may use aggression or destruction to communicate that a task is too difficult. Alternatively, some students may use these behaviors to avoid activities or manage their anxiety.

By using CAI SDLMI during and after the treatment students showed a positive effect in learning. Students are able initiate the learning, know what they want to learn, and to get known of their characteristic in learning and how to solve their problem in learning. Students were more excited because the task were challenging to them and considered not too difficult which led to a relax situation of teaching and learning process. The step by step process using computer demand the students to type, this effect the students' behavior maintained such as decreasing the indication of unwanted behavior of stereotypic and repetitive motor mannerisms. SDLMI in particular made the students had a commitment to realize their aggression, tantrum, and screaming, therefore when they became uncontrolled, the students were reminded about their commitment.

Discussion

Technology has found a welcome home in foreign language education. Language instruction that integrates technology has become popular and has had a tremendous impact on language education. Williams & Williams (2000) suggest that integration of technology can improve academic performance, enhance motivation, and promote learning. To examine how technology supports teaching and learning, Chatel (2002) conducted interviews and observations with eight classroom teachers and four ESL teachers and asserted that the selection of appropriate software and websites help ESL students learn and apply English. Lasagabaster and Sierra (2003) conducted a similar research study to examine the attitude of 59 undergraduate students toward CAI. The findings revealed that the students had a positive attitude toward learning another language with computers.

CAI brings with it several potential benefits as a teaching/learning medium. These include self-paced learning, self-directed learning, the exercising of various senses and the ability to represent content in a variety of media using SDLMI. Although CAI has not been studied in the EFL community for autistic students' situation, many of the benefits in the general CAI context should also be available in the EFL learning. Study by Entwistle (1981) have shown that when learners can learn in a way that suits them, improvements in the effectiveness of the learning process normally ensue. Humans are multi-sensory animals. The more senses through which we receive information, the easier it is to remember. According to Fletcher (1990), people remember 20% of what they hear, 40% of what they see and hear and 75% of what they see, hear and do. The fact that the computer can exercise various senses and present information in a variety of media can enhance the learning process.

An essential element for nearly all of the components skills of self-determination is the students' ability to communicate. Expressing one's choices, making decisions, asserting oneself, and evaluating one's own behavior are all primary elements of self-determination. They all require a mechanism for communication. Recent research indicates that students with significant intellectual developmental disabilities are students who often have limited communication competence (Kleinert, 2007). On the other hand, research has shown that individuals with disabilities who have strong self-determination and those who can utilize augmentative communication system to express themselves have a better postschool outcomes and reported quality of life (Hamm & Mirenda, 2006). In light of the importance of communication skill in self determination, Light and Gullens (2000) noted that communication competence is necessary for an individual to become fully self-determined. Although self-determination is clearly critical life skills for all students, teaching self-determination to students with autism who has a functional communication problems can be problematic for teachers. Abilities such as voicing preferences, making choices and selecting personal goals are integral skills for self-determination (Agran, et al. 2003).

Given these challenges and the need of self-determined learning, Mazzotti (2012) collaborate the learning with computer assisted instruction (CAI) and SDLMI to solve those problems occur in teaching and learning process. However, the teaching and learning of CAI SDLMI, was yet to be researched in the field of English for Foreign Language with autism. Theoretically by solving the problems of autistic students in their behavior and communication, CAI SDLMI would be effective to be used. This research which investigated the effect of CAI SDLMI to EFL learners with autism provided evidence that CAI SDLMI is practically available for English teachers who teach autistic students.

This study extended the CAI SDLMI literature into English teaching and learning for foreign language students with autism. The three stages of CAI SDLMI was modified by setting their goal in the learning English, what they wanted to accomplish, and what were the strategy to be implemented. This research contributed in some ways.

First, The interaction using CAI interact students attention and as a medium for students and teacher to interact each other. Mechling, Gast, &Krupa (2007) argued that CAI can be an effective format for teaching students with disabilities for various skills such as social skills.Students were significantly improved their social skills in class by teacher and students interaction in CAI. The indication was the students generated questions related to the material given and what they should do in the three stages of CAI SDLMI.

Second, CAI SDLMI encourage students to work more independently. As proposed by Mazzotti (2012) allows students to work independently or with minimal guidance from a teacher. In the classroom situation which autistic students should blended with other students with other disabilities, teacher was demanded to handle the class evenly. By using CAI, students were taught using computer and LCD which enable teacher to integrate the teaching strategy to other students as well. The autistic students were paired with teacher and other students to get an immediate response in the teaching and learning process. This current study also proved that CAI SDLMI can be used as a tool to promote students-teacher interactions and student to student interaction.

Third, CAI SDLMI is applicable for the teacher to teach English. As proposed by Stang, et al. (2009), self-determination is valued by both general and special education teachers. His statement is in accordance to the finding of this research that not only special education teachers that find this useful but also for general teachers English language teaching fields. As mentioned by Mazzotti (2012) CAI SDLMI can provide teachers with an effective method for teaching one component of self-determination i.e. goal setting to students exhibiting problems behavior, teacher of general education dealing with autistic students

might be able to modify it into a specific subject such as English.

This study also observed the progress in students speaking ability in English by examining data taken five times including pretest, treatment and posttest. The students showed a gentle improvement as the intervention took place. The improvement showed positive progress during the treatment given in each meeting. Students need to adjust to the strategy using CAI SDLMI in the beginning, but then they can keep up and cooperatively use the strategy during the teaching and learning process afterwards. That indicated the positive wash back using the strategy and also positive short effect by bringing satisfactory level of goal attainment to the students.

In order to achieve preferred improvement both in academic skill or engagement on students' interaction and communication problem of autistic students, this study is limited n some regards. First, the participants were limited into two male and female autistic students in a particular setting. Second, the intervention limited to the measurement on pretest and posttest data. This resulted in the absence of the position of CAI SDLMI to others methods in teaching and learning of English for foreign language students with autism. The results of this study leave questions for future researchers to investigate. Future research might investigate the effectiveness of CAI SDLMI compared to other methods of teaching English for autistic students. The further researcher should involved more participants vary in the age and number of participants involved in the research. The setting used in this current research limited to special education setting, meaning that the involvement into other various contexts such as inclusive education should be reassured. The CAI SDLMI that is carried out by a general education teacher only or special education teacher only should be investigated in a more detailed investigation.

CONCLUSION

This study provides support for EFL teachers or special needs' teachers in teaching English by providing evidence of the effect on speaking ability using CAI SDLMI. The intervention using this method led to the variation of teaching EFL learners with autism. In conclusion, CAI SDLMI is an effective tool to teach Speaking ability of English for EFL students with autism by promoting self-determination skills of students exhibiting problem behavior while reducing disruptive behavior in the classroom.

THE EFFECTIVENESS OF THE USE OF MUSIC AS A METHOD FOR HYPERACTIVE STUDENTS CONDITIONING IN THE ELEMENTARY SCHOOL

Sularso; Rini Hariyani

Ahmad Dahlan University

Email : sularso.etnomusikologi@gmail.com

ABSTRACT

The conditioning activity is one of several aspects to make a successful learning process. During these times, the teachers usually use some methods such as clapping, commanding and also ice breaking, yet the teachers are rarely use music as the method of conditioning, especially for hyperactive students in elementary school. In fact, musics are the fact sounds that have current frequency which can be arranged to produce the sound of harmonious. The psychology effects of using the music as the conditioning method is that musics make people who hear it become relax. Nowadays, the music phenomenon in elementary school is only used as the material of performances, yet musics are very effective to be the conditioning method in elementary school. This study will specially show the readers about the effectiveness of the use of music as the conditioning method for hyperactive students in elementary school. The hyperactive students are the students who cannot be quiet for a long time, so if this condition always occur, it will disturb other students. Because of the fact that hyperactive students are difficult to be controlled, so using command method is not appropriate. This study uses qualitative data that are found through library research. The writer hopes that the result of this study can help the teachers to overcome and determine the appropriate method in conditioning students, especially the hyperactive students.

Key Word: Music, Conditioning activity, Hyperactive students

The conditioning activity is one of several aspects to make a successful learning process. Sanjaya (2014:150) reveals that conditioning activity is beginning activity who teacher done to make good condition for students easy receive the lessons. The learning process can be called as the successful learning if the students are ready to receive the lessons from the teachers. So, the conditioning activity of students are important to help the students command the lessons.

Musics are the fact sounds that have current frequency which can be arranged to produce the sound of harmonious. Music had an effect on daily life, because music has many benefit. Djohan (2005:142) says that benefit of music are to train on how to get sensitivity of stimuli environment and as the instrument to increase and help ability development personal and social which include cognitive ability aspects, intellectual activity, intelligent, creativity, reading, language, social, behavior and social interaction. Therefore, activity of musics are important to motivated brain development and increase student intelligent level.

The psychology effects of using the music as the conditioning method is that music make people who hear it become relax.

When hear music in a complete manner or rhythm only, the heartbeat, respiration, electric resistant on the skin had be change, the heartbeat will adapt itself with the rhythm who people who hear it (Djohan, 2005:135). When the people are hearing slow rhythm of music, then the heartbeat will adapt with that rhythm. So that music rhythm give piece and confident to people who hear it.

That effect makes music many used to therapy in medical world. Music therapy is health therapy which uses music as medication in order to increase or repair physical, emotional, cognitive and social conditions on individuals from various ages (Suhartini, 2008). The same opinion reveal by Djohan (2005:224) music therapy used to repair physical health, positive social interaction, expand interpersonal relation, emotional expression in natural manner and increase conscious thought to selves. During these time, therapy of music is good medicinal treatment to treat all kinds of mental disruption, trauma, physical defect and study disruption. Music therapy is therapy which had many best than other therapy, there are more economical and easy to uses for all sufferer without having looked at education background.

However in Indonesian, music utilization immediately which related with daily human life yet be development (Djohan, 2005:143), in fact for importance education world, the function of music yet maximal. During these time, music yet be function as material for performance and entertainment. The society in Indonesian yet realize that music can be used in various life aspect especially in education aspect. Nowadays, the music phenomenon in elementary school is only used as the material of performances and extracurricular, yet musics are very effective to be the conditioning method in elementary school.

During these times, the teachers usually use some methods such as clapping, commanding and also ice breaking to conditioning student before the learning begin. But as long the process that method not effective to apply for hyperactive student. Syamsi (2005:55) reveals that hyperactive student is people behavior who somebody had overactivities or over movement and that behavior not systematic or not know that consequence. Hyperactive student had motoric problem, social interaction and not be quiet behavior and also not to hear command from another people, usually debate, temper aouburst, behavior diverge and usually contradiction to another people (Suharmini, 2004:123). Their activities tend to be difficult to be handled, so if this condition always occur, it will disturb other students. Because of the fact that hyperactive students are difficult to be controlled, so using command method is not appropriate. The writer hopes that the result of this study can help the teachers to overcome and determine the appropriate method in conditioning students, especially the hyperactive students.

METHOD

The methodology used in this research is the study of literature (library research). The data of this research are found through collecting journal by music therapy and hyperactive student keyword. The journals are found from American Music Therapy Association, Media Ners, The Music Therapy, Journal of Undergraduate Research, Jurnal Rehabilitasi dan Remediasi, Kajian Ilmiah Psikologi, Humanitas, dan Jurnal Psikologi.

FINDING AND DISCUSSION

Music Therapy is one therapy which used music to give confident for people who hear it. Some research explains that music can give positive effect. According by Susanti and Rohmah (2011) the slow music tempo can give positive effect for body and increase quality and also the body function such as slowed up beat of heart. Music classic or instrumental give positive energy, power full effect and piece. Music increase relaxation feeling (Dewi, 2009). So, the music make people who hear it become relax and feel confident. This condition is appropriate to student before begin the lesson. The lessons can be receive by student nicely. Because as long as the lesson, students can be focus with the lesson.

The hyperactive students are the students who cannot be quiet for a long time. Their activities tend to be difficult to be handled, so if this condition always occur, it will disturb other students. The conditioning method such as clapping, commanding and also ice breaking is not appropriate. Because of the fact that hyperactive students are difficult to be controlled. Many research who showed that music has many benefit, for example the research who be done by Hammer (1996), Hendricks (2001), Azbell and Laking (2006), Suharmini (2004), and Hernandez (2005) explain that music can decrease anxiety level and depression.

Other research who be done by Rusmawati dkk (2012) about music therapy effect to decrease hyperactive student tell that music therapy is very effective to decrease hyperactivities that are to not sit quiet for a long time behavior and quite from the sit without reason to student who get Attention Deficit Hyperactivity Disorder (ADHD). Based on the treatment who be done that are found data such as
Graph 1. Not be sit quiet behavior
Graph 2. Quite from the sit behavior

Based on the graphics are found data that decreased frequency of not be sit quiet behavior for a long time and frequency of quite from the sit behavior without reason. The result that music can be used as method to conditioning hyperactive student before the lesson begin. Proven the result that music can decrease hyperactivities frequency who be done by hyperactive student.

Conditioning hyperactive student by music method can be used with some steps, (1) prepared the music instrumental or music classic which slowed tempo, (2) Teacher tell story to form imagination of student, (3) teacher make a interesting story and student challenge, (4) Finish the story after the student ready to receive the lessons. Besides that the teacher can insert the lesson into the story.

CONCLUSION

Based on the result of study literature that are music can be used and very effective as conditioning method before the lesson begin specially for hyperactive student. Because music can give positive effect for someone who hear it. Heart beat can be adapt by itself with the slowed music tempo, so can increase relaxation feeling. Hyperactive student cannot be quiet for a long time and always have many activities. Surely, it that give effect for heartbeat, that are more and more activities, so the heart beat also increase. The hyperactive student who have many activities before the lesson begin, will be difficult to focus. Therefore, before the lesson begin, the teacher must be do conditioning method to ready receive the lessons from the teacher.

QUALITY MANAGEMENT
OF THE GUIDANCE AND COUNSELING SERVICES
IN SMA NEGERI 1 BANJARMASIN

Sulistiyana
Lambung Mangkurat University, Indonesia
e-mail: sulistiyana.nh@gmail.com

ABSTRACT

The low level of student's achievement are influenced by the inability of students to develop their self potential optimally, this is related to the guidance and counseling services in schools, Guidance and counseling services management that not used total quality management is one of the factor that led to less optimal counseling services in schools.This study aims was to describe : quality management model applied in guidance counseling services in SMAN 1 Banjarmasin and Counseling service management model that can be applied to accelerate the quality of counseling services at SMAN 1 Banjarmasin.This study used a qualitative approach in form of case studies, the seeting of the research was SMAN 1 Banjarmasin. The data collecting used in-depth interviews, observation and document analysis. The validity test of the data were done by using triangulation techniques and triangulation of sources. The data analysis was use the Milse and Huberman models that included collecting data, reduction and display of the data and generalization.The results showed : 1) Elements of quality management model applied in guidance and counseling services in SMAN 1 Banjarmasin can be formulated as follows : a) The commitment of the guidance and counseling services from the principal and other (service staff, teacher and BK coordinator), b) Customer satisfaction, as a satisfaction of the students as users of counseling services in schools. Because the students are internal customers as well as external customers, c) Empowerment of all staff in the school in terms of guidance and counseling services, d) The principal leadership that collegiality and delegative style for guidance and counseling services, e) Continuous of Monitoring and evaluation. This evaluation is done periodically and continuously. 1) In the concept of total quality management (TQM) to the five elements can conclusion are as follows: a) Commitment, b) Customer satisfaction, c) Staff Empowering, d) Leadership, and e) Continuous monitoring and evaluation. 2) Model of Total Quality Management that implemented not yet comprehensive if we seen from TQM theoretical model some components that do not exist are: the organization of the quality (board of quality), education and training staff (continuous improvement), partnership, autonomy and reward system. Based on these results the suggestions that can be submitted are : schools and other stakeholders in particular for school guidance and counseling unit, must make the vision and mission of guidance and counseling program, create the standart operational procedure and improve the quality management model that were implemented in the school.

Keywords: quality management, counseling services.

Many changes happened in the society and the development of science and technology which grow fast gave a big influence in world of education. In order to answer the challenges of this era, it is required an ability to manage available resources. The improvement of human resources is an absolute prerequisite for achieving development objectives. As the critical success factors of development, the quality of human resources is enhanced through a variety of educational programs conducted in a systematic and purposeful way.

A good quality education started from qualified institutions, which required good quality of school management through quality management approach, known as Total Quality Management. It is expressly stated by Deming and Crosby which were quoted by Suriansyah (2012) states that the quality of an organization is determined by the management of 80% and 20% is determined by other factors. Other studies that put forward by Cartono (2002) stated that in order to generate resources or a good quality product requires a system providing education quality as well. A good quality education system is a system that is capable to move the culture of quality in every element of education.

A school management with good quality would be able to produce graduates who are not only focused on the ability of learners cognitive / academic, but also the development of an optimal student participants, including characters and skills.

School institutiom as an educational institution that is able to produce qualified graduates, at least managed by the three pillars of education that can not be separated one from others. The three pillars are the management / supervision, teaching and counseling. (Nurihsan, Sudianto, 2005).

Guidance and counseling as one of the pillars to show clearly the parallels between the position of guidance and counseling services which create independent character, with the service of education management and service of learning that educate in frame of curriculum especially in the school system as form of formal education institution.

The existence of school management policy that has understood well guidance and counseling surely will became better and get the support in order to ease the execution of guidance and coulseling program as a part or element which could have a significant role to increase the school's quality to optimalize student's development. As one of the effort to increase the quality, guidance and counseling in school need to be executed by professional counselor that is managable and empowered so it may gave a good quality of service. Guidance and ounseling service will not exist, run and achieved well if it doesn't have a good quality of management system.

The fact that happen on the field related with the students has showen some data as follow: delinquency students (middle and high school age youth) such as brawl were recorded during 2012, there has been a student fights eleven times. Of the eleven events, there are five fatalities, "said Head of Public Relations Jakarta Police Commissioner Rikwanto on Thursday (27.09.12) at the Metro Jaya Police Headquarters (Kompas.com: 27/09/2012) Drug abuse (drugs), free sex, free sex even, the circulation of pornographic scenes that were played by students and so on.

On the other hand, guidance teacher still did't have a significant role as a guide or even councelor (Suriansyah: 2010), a counselor often equated by students as a security officer that take care of students who are late, undiscipline and etc. In other words the guidance service were still questioned in aspect of quality.

In order to answer the various problems that exist in the Integrated Quality Management education which will give the professional education solutions to meet the challenges of the present and the future, because the integrated quality management can be used to build alliances between education, business and government. Integrated quality management can shape society responsive to change society in a globalized world. Integrated quality management can also form schools responsive and able to respond to changes in the field of education in order to give satisfaction to the service recipient and stakeholders.

From the problems above, this research wanted to know the model of quality management of guidance and counseling service in SMA Negeri 1 Banjarmasin and the apllicative model in order to fasten the service guidance and couseling with good quality.

Quality Management is an aplication of some technique collection in management, based on the availability quantitative and qualitative data, and empowerment of all school component in sustainable way to increase the capasity and the school organization ability to fulfill the need for learners and society.

Santoso said that the total quality management is a management system that elevates the quality of a strategy oriented to customer satisfaction by involving all members of the organization (2003: 4).

Refered to the concept above, management of guidance and counseling services that have good quality will be more beneficial for students if it is supported by good quality of human recourses, principal, guidance counselor, classroom teacher and the student itself. The development of guidance and counseling in particular required a strong management support and relevant with the vision and mission of guidance and counseling.

Guidance is a process of helping to student so they will be able to understand their self potential and the surroundings, accepting themselves, develop themselves optimally and adapting in positive way and constructive in life norm demands so they will achieve a meaningfull life (happily), whether personal or socially. (Yusuf, 2006:30)

Guidance can be defined as a process in providing assistance to a person so that he can live happily and free from problems that bothered him.

Counselling is an effort with four eyes or face-to-face between counselor and client that contains a business that barrel, unique, human (humane), which is carried out in an atmosphere of expertise and that were based on the norms which in charge, so that clients gain self-concept and self confidence to improve his behavior at this time and perhaps in the future. (Sukardi, 2008: 38)

From the concept above, the relation between guidance and counseling is that counseling is a main activity of guidance with the individual assistance aim in interactive relation situation between counselor-client. It is simple stated that counseling is a core of guidance service. (Munandir, 2009:1004)

In order to optimize the service of guidance and counseling, the school counselor need a good management activity and real management skill were actually one of the most required competence of school counselor. *Permendiknas No 27 Tahun 2008* about standart academic qualification and counselor competence stated that a scholl counselor need to mastered all of determined competencies, one of the competence which is need to be mastered is a profesional competence of 13-15 that is a counselor is charged to be able to do a guidance and counseling management. Guidance and counseling management is all activity that stated from planning, organizing, action and evaluation on the process of guidance and counseling.

METHODS

This study used a qualitative approach in form of case studies, the seeting of the research was SMAN 1 Banjarmasin. The data collecting used in-depth interviews, observation and document analysis. The validity test of the data were done by using triangulation techniques and triangulation of sources. The data analysis was use the Milse and Huberman models that included collecting data, reduction and display of the data and generalization.

RESULTS AND DISCUSSION
Results

The results showed : 1) Elements of quality management model applied in guidance and counseling services in SMAN 1 Banjarmasin can be formulated as follows : a) The commitment of the guidance and counseling services from the principal and other (service staff, teacher and BK coordinator), b) Customer satisfaction, as a satisfaction of the students as users of counseling services in schools. Because the students are internal customers as well as external customers, c) Empowerment of all staff in the school in terms of guidance and counseling services, d) The principal leadership that collegiality and delegative style for guidance and counseling services, e) Continuous of Monitoring and evaluation.

This evaluation is done periodically and continuously. 1) In the concept of total quality management (TQM) to the five elements can conclusion are as follows : a) Commitment, b) Customer satisfaction, c) Staff Empowering, d) Leadership, and e) Continuous monitoring and evaluation. 2) Model of Total Quality Management that implemented not yet comprehensive if we seen from TQM theoretical model some components that do not exist are : the organization of the quality (board of quality), education and training staff (continuous improvement), partnership, autonomy and reward system.

Empirical Model Discussion
Leader Commitment Towards Quality, Similarity of Commitment to Quality by All Academic staff and other supporting staff.

In the picture of quality house model which found that to built a good quiality culture is not enough just with the commitment on the leader level, but also all staff commitment, also academic staff (teacher an or teacher/lecturer) or other supporting staff. To built a commitment from all staff was cannot be done by just doing socialization, but it need other effort which contact the need of all staff, material or immaterial. Besides from that, the similarity between leader and staff commitment will brought a good quality of work. That similarity were built because of needing each other behaviour between institution, leader and staff, need each other was made as the impact of the growth of need each other feelings from staff an organization members towards the institution and the leader. The description above is basically supports the concepts put forward by some experts stating that the involvement and commitment of different managers at every level is a critical issue in the implementation of TQM (Deming, 1986; Juran, 1989, 1992; Crosby, 1978; Ishikawa, 1985) , This means that the quality management as a management approach that is rooted in the quality paradigm will be successful if the commitment of managers and members / staff he leads is not different or there is a strong similarity in the commitment of everyone in the organization.

Provide Satisfaction for internal and external Customer

Starting from the demand to quality education, the educational institutions have an obligation to improve the quality of the service. To go to a good quality service, some experts are already introduced TQM principles as a step toward better management in higher education (Erickson, 1995). In connection with the primary mission of TQM is to meet customer satisfaction, organizations that want to maintain their position has let strong feelings and are confident of the quality (Peter & Waterman, 1982).

Based on the data obtained, the study came to the conclusion that customer satisfaction is one of the most important element in the implementation of the good quality of working culture, so that the institutions are qualified to be the sample in this study always emphasized customer satisfaction as a key element in all of the activities which were undertaken. All activities that were undertaken often leads to efforts to achieve customer satisfaction. Other experts are also strengthen as the above findings proposed by Beaver (1994) which states that provide the best service to the customers is very important and is a principle to ensure the achievement of higher education institutions. Achievement of higher education institutions will continue to increased if it seeks to give a greater prominence to the expectations and needs of the customer (Deshields et al., 2005). Sahney et al. (2004) noted "... let the efforts made to satisfy customers, mainly internal customers ie the students".

Collaborative and collectivity leadership

Leadership as one of the components that determine the success of the organization to achieve

its vision, mission and objectives need an intensive attention for organizations that want to grow and develop as well as quality. Due to the large influence of leadership in bringing a quality organization, Yang (2006), the achievement of good human resources can be achieved through education, leadership and incentives available to employees. In another study also found that the program management procedures within the organization based on solidarity and collectivity, accompanied by firmness of policies will have an impact on the implementation of the program towards the desired quality. This problem is also directly shape the culture of thinking and quality work culture.

Staff Involvement in Decision Making and the Use of Team

The involvement of staff in decision-making and the use of quality teams is one of the component in quality management using TQM approaches. Research conducted by Suriansyah (2010) also found that when the academic or non academic staff involved at the policy-making process and guidelines (including in this case the manufacture of various standards), will foster a sense of self belonging which always increasing. Besides, the involvement of various parties will raise a sense of responsibility of all staff, whether academic staff or support staff, especially in the implementation of any policy decisions.

Control and Periodic Continuous Assessment

Control and assessment through stakeholders and through the student in order to guarantee quality of service (in terms of quality working culture) is one of the findings of a study conducted by Suriansyah (2010) which has a difference with the other findings in the TQM model. The importance of control and assessment in the implementation of TQM is recognized by Arcaro (1995) which states that it takes a team to control the results of the implementation of TQM to ensure the achievement of the desired results, but the quality control is often overlooked by organizations that implement TQM including educational institutions, so that most institutions never achieve the desired consistent result. The findings of this study revealed the importance of customer satisfaction assessment through student satisfaction with services provided and external customer satisfaction is a factor that has influenced the working culture of staff, if the results are given information in the form of feedback to the party which gave the service.

Discussion

Considering the quality management model components that are implemented in guidance and counseling services in this school there are some components that have not been found, it would require other components as a theoretical model proposed in this study in an effort to improve the quality of service in the school.

Values, norms, vision and mission that is realized through their design quality and Standard Operating Procedures.

Some literature in general had a similar and agreed that the emphasis on the need to change the culture of an organization is a necessary condition for success and successful implementation of TQM (Adebanjo & Kehoem, 1999; Ahmed et al., 1999; Kanji & Yui, 1997; Manley, 1998; Vermeulen, 1997). Therefore, changing the organizational culture towards work culture of quality into something very strategic. But cultural change can not be done if it only uses the ways of instant and incidental, but changing the organizational culture must be done through a special program run continuously / sustainability (Ciampa, 1991). In some studies done by experts and the organizations of the quality management studies, it was found that the effort towards quality service, need to be done from the beginning. Some initial actions that must be done include fundamental issues such as setting the vision, mission, characteristics, values, behaviors and values of work culture. Therefore, the design good quality of working culture that is clear to everyone (members of the organization).

Based on this description it is clear that organizational culture and work practices is a value system that is understood and believed by all members of the organization as a guide and a foundation for every movement and behavior of their duties. With the confidence and trust that is strong against the value system of all the problems in the organization of work can be handled easily.

Competence In Continuous Improvement / sustainable and Programmatic

An efforts to improve the competence of continuous and programmed represent an extremely strategic and important to build a culture of quality within an organization. The more organizations that embrace quality management approach, the increased competence is one component in TQM. Sallis (1995) states that TQM can be understood as a philosophy of continuous improvement / continuing to organizational goals can be achieved through the involvement of all components within the organization. This statement meant that the continuous improvement is an important element in the implementation of TQM focusing on customer satisfaction.

From the above discussion it can be concluded that the successful implementation of TQM and the creation of good of quality working culture is largely determined by the quality of human resources. The good quality of human capital can be achieved through education and training is done programmatically and continuously.

Management Activities Autonomy

Autonomy and involvement should be considered in the management culture of this quality. Autonomy will increase employee engagement, communication and involvement in decision-making and will reduce the distance or the gap between staff / member organizations by the organization itself (Mosadegh, 2006).

The results of this study are also similar to what has been found in studies Jong and Hartog (2007) which states that the autonomy of the staff can provide smooth quality work. As also stated by Krause (2004) that leaders can require staff to always do something innovative with freedom and autonomy.

Cooperation and partnership with External Customers

Cooperation and partnership is one of the component in the model of quality management or TQM. This partnership is very important for an organization that wants to build the organization into a large and qualified. In connection with Sufyarma (2003) states that one way to restore the state universities (including school education) the problem is to establish a mutually beneficial relationship between stakeholders (businesses) and colleges. Of the various opinions indicate partnership is something that is to be conducted by the college in order to achieve customer satisfaction.

Various opinions and findings of a study conducted by experts as described above, strongly reaffirmed the elements TQM proposed by the teacher quality mention that one of the elements of TQM is customer satisfaction.

Incentives and Rewards

Incentives and rewards as one of the component in TQM is often a major concern by the staff. Various organizations in Indonesia are often lost power and costs, and lost productivity is very high due to the incentive system which is not right, not fair and not worthy of it's staff.

Thor (1994) argued that the award is one of the prerequisites for the implementation of TQM, and so on will affect customer satisfaction. These findings suggest that the rewards can be an important element for the implementation of TQM.

Quality Control Organization

Organization of quality control is one of the elements necessary in the process control and quality improvement in an organization. In this regard Arcaro (1995) states that in the implementation of TQM needed a quality team that was set up to resolve the problem. This team can be in the form of a cross section (cross department) or across functions. This team is very important to deal with issues that have a significant influence on the implementation of quality in institutions. The importance of quality control organization in an institution recognized by Anataraman (1984) stating that TQM requires effective team.

The findings are quite strategic in working towards a culture of quality in studies conducted by the experts is the need for organizations / institutions responsible for the development and quality control. There are various names used by the organization to call this team, such as the Development Team and Quality Control, or quality assurance unit, quality assurance agencies and others that usually side by side with the leaders of the organization. This team is an important element of the successful implementation of TQM. This finding is not different from what was found by Owlia and Aspinwall (1997) in various universities such as Quality Council (Aston University), Quality Assurance (Wolverhampton University), Quality Derveloplment Manager (Leed University) and Dean of the Quality Initiative (South Bank University).

The problem above is also in line with the statement Sobirin (2007) which states that the formation of a new culture within an organization relies heavily on the human aspect. He argues that 1) humans are basically not just objects but also subjects that do not simply follow the wishes of others, but also tends to determine the direction of their own goals, so it tends to reject the wishes of others if deemed not in accordance with his wishes; 2) because each individual has a thought (mind set) which are different, then the behavior of each person is different (low of individual differences) and 3) in addition to individual differences, at the same time humans are also social creatures who cannot stand alone, so whether realized or not he would try to form or at least be partially rather than a particular social system (organization).

CONCLUTION

Based on these results the suggestions that can be submitted are : schools and other stakeholders in particular for school guidance and counseling unit, must make the vision and mission of guidance and counseling program, create the

standart operational procedure and improve the quality management model that were implemented in the school.

KNOWLEDGE AND ATTITUDE STUDENTS
INFRASTRUCTURES CAPACITY AS
A LEARNING PERSPECTIVE IN LIVE BASED LEARNING

Sulton
State University of Malang
E-mail: sulton.fip@um.ac.id

ABSTRACT

The study aims to explore how students see the role of ideas to work in the knowledge and how these views related to the activities of their inquiry based course professions Education Technology (TEP). Exploration is an increase in the capacitance of students in the perspective of live based learning. The data mainly come from the student activities in group discussion and investigation, and a survey on the role of ideas for knowledge and profession TEP.

Keywords: live based learning , attitudes, knowledge.

Learning Course Profession TEP is still based on the design of the course half tight. Learning as argued by Reigeluth (2013), paradigm of education before the 21st century is based on an industrial model where standardization and mass production manufacturing highly appreciated. Subject profession TEP was dominated by education tends to highlight the efficiency of individual knowledge acquisition and accumulation by teaching learners with content similar and skills that have been determined by a rigorous curriculum guidelines under the right timeframe. Conditions rigorous study was based on research Adams and Engelmann, 1996; Magliaro, Lockee, & Burton, 2005. Need to increase the ability of students TEP in the ability to express ideas and concepts. Practice learning is felt the students are still less given the opportunity to be the autonomy to engage in independent inquiry that requires them to produce and continuously improve their ideas for the development of student knowledge. However, given jargon knowledge-based society (UNESCO, 2005), the practice of conventional education must also shift more focus on the ability to build competence and creativity are able to work creatively and collaboratively with ideas to solve social and environmental problems (Florida, 2002).

The idea of student needs strengthening in order to become a new innovation. This contrasts with the current learning where ideas are often viewed as the mind that is determined based on the plan of teaching and classroom routines. Students with innovative ideas in the classroom sometimes even treated as student unruly and acting. the ideas were not asked specifically highly undesirable will get penolakan because it does not have compatibility with curriculum and content. Papert (2000) describes the situation as it is commonly seen in most traditional learning environment as "the idea aversion" (ie, do not like the idea). These conditions instilled with the belief rooted as it is not possible for students to be given the opportunity to produce ideas of their own and work with innovative ideas for the advancement of collective knowledge. it is also possible for students to learn to appreciate the importance of ideas to create new knowledge and solve real-world problems.

PROMOTING OF VIEW HOW STUDENTS

One way to help students develop a deeper understanding and appreciation of the "ideas" as an object essential to the creation of knowledge may be the involvement of students is to provide actual cases to carry out activities (Hargreaves, 1999; Hong & Sullivan, 2009; Scardamalia & Bereiter 2006). Build knowledge is defined collaboratively is through strengthening the process that is focused on strengthening the idea of a community (Bereiter & Scardamalia, 2003). As a pedagogical approach centered on the idea, the development of learning refers to three world position of epistemological constructivism. In addition to the physical world / material (world 1) and the psychological world that exists in the human mind (world 2), Popper suggests a world three realities primarily the ideas. These ideas are produced by a professional knowledge (eg, engineers, scientists, designers, and architects), they are embodied in the life social like real, real-world objects that can be experimented with the problem. under the world three ideas should be treated as tentative knowledge claims and will continue to have a critical examination (for example, through the examination, clarification, and changes) for further development. Likewise, in order to develop a knowledge-building

community success, students also need to understand the role of third world object improvable ideas for the advancement of knowledge collectively (Scardamalia, 2002), Lecturer only treat the student in the world and 2 in the psychological construct to achieve gain knowledge. Bereiter (1994), a conventional classroom teaching tends to focus on instilling in the students' minds and should grow and be determined by knowledge from the perspective of the world 2, while ignoring the importance of competence to work with the ideas in the world 3.

Distinguish two different modes of knowledge work is very important. Two modes of knowledge is a mode conviction and cashews design (Bereiter, 2002; Bereiter & Scardamalia, 2003). To explain, mode conviction emphasizes the ability to evaluate ideas or knowledge claims using the established and accepted as true belief. Students intellectually have a life and a class dominated by modes like to think. When the mind of students to work in the mode of confidence, they are often guided to reflect on questions such as: Is this idea is correct or fair? What assumptions this idea is based? Instead, the design mode of thought highlighted the ability to go beyond the pursuit of truth by engaging in idea generation sustained and increased for the advancement of knowledge. When a student is committed to the fashion design knowledge work, they tend to ask questions like: What is the value of this idea? What is it good for? What can or cannot do? How can it be further improved? While both modes required for knowledge work, the epistemological difference main between the two modes of view is that the mode of belief tends to highlight the acquisition of knowledge and accumulated by seeing ideas as knowledge admitted verified; while fashion design intended to facilitate the work of innovative knowledge to see ideas as improvable objects to the advancement of knowledge (Cross, 2007).

One important thing to note is that it is involved in the design of knowledge work-mode is, basically, the metacognitive process, as one must constantly reflect and plan ahead for the conditions to continue to promote the idea. Especially from the perspective of construction of knowledge as a social process, the type of behavior metacognitive necessary to design activity-mode should be collective (not individual) is reached. How can a group of knowledge-building look at the role of ideas and appropriate exercises that have self-regulatory as an attempt to influence the effectiveness of thinking student (Hong &

Sullivan, 2009). previous research has also shown that productive collaborative knowledge work is strongly associated with regulatory activities of the group (eg, Dehler, Bodemer, Butler, & Hesse, 2011; Goos, Galbraith, & Renshaw, 2002).

PROMOTING THE PROCESS IMPROVEMENT IDE

Hong and Sullivan (2009) propose learning centered on the idea within the framework to describe the emergence of the ability colaboration and independent process as the idea continus and improvement in an environment typical of knowledge-building. The framework envisions "idea generation", "diversification of Ideas", and "elaboration of ideas" as the three essential activities for effective process improvement ideas.

First, in terms of idea generation, most of the research literature has been considered as an important phase for the knowledge productive or design work (eg, Linsey et al., 2011), and important line of empirical research has been investigating strategies for effective learning or techniques to help ideas generation (Faure , 2004 ; Miura & Hida, 2004; Mumford, 2001; Paul & Yang, 2000; Rietzschel, Nijstad, & Stroebe 2014). For example, Rietzschel et al. (2014) study found that when students are guided to work more narrowed (in contrast to the wider) scope of the problem or when they were asked to come up with ideas that are more authentic (as contrasted with the more relevant), they are more likely to come up with ideas -ide innovative. Hong, Chang, and Chai (2011) study found that it is more likely to foster idea generation when students are allowed to study on the problems of their own interests and when the climate of learning in an environment perceived by students as a more open and creative ,

Second, from the perspective of socio-epistemological (Fuller, 1988), the idea of diversification can be achieved by way of exchanging ideas or perspectives between members with expertise distributed. Previous research has suggested that the exchange of ideas is essential to the process of knowledge advancement (Gong, Kim, Zhu, & Lee, 2013; Hong, Scardamalia, & Zhang, 2010; Perttula, Krause, & Sipila, 2006). For example, Perttula (2006) design experiments found that people who swap ideas are more likely to generate more ideas. Kohn, Paul, and Choi (2011) conducted two experiments to explore the process of sharing knowledge where ideas were exchanged and / or combined in the activities of bulk student opinion. They find that the business group was more effective than individual efforts in generating more novel and combination of decent ideas.

Third, from the perspective of evolutionary epistemology (Popper, 1978), the ideas can be

refined as knowledge workers reflect collaboratively in the potential and limitations of the ideas in question. Previous studies have investigated ways of collaboration to help ideas more complicated (eg Chen, Chuy, Resendes, Scardamalia, & Bereiter, 2011; Kipp, Bittner, Bretschneider , & Marco in 2014) and the way of elaboration of ideas that can enhance or inhibit creative knowledge work (eg, Kudrowitz & Wallace, 2013; Stark & Perfect 2008; Verhaegen, Vandevenne, Peeters, and Duflou, 2013). For example, Kudrowitz and (2013) study Wallace found that the systematic use of metrics integrate the three attributes (ie, kebaharuan, usability, and feasibility) as a means of elaboration can assist in identifying ideas -ide more innovative.

In the process of improvement of the idea of earning, it is necessary once initial ideas are generated, they must reification (for example, served as a note or message and contribute). Doing so helps transform initial ideas of mental constructs individual to become public property were recorded permanent. this is important because the idea is understood only in one's mind (as the world 2) cannot be treated as a real object for improvements collectively. Furthermore, the level of diversification of ideas and the exchange is a function of how the ideas spawned more ideas and interact and relate to one each other; and the reflection of ideas or elaboration is a function of how to collaborate knowledge and try to increase the value of ideas and deepen their collective understanding of what ideas can or cannot do to address the problems they face. In the optimal situation, an increase of ideas depends on the processes that arise from the generation of ideas, with the diversification of ideas and elaborations serve as two social mechanisms important is closely linked to enable the transformation of initial ideas into more innovative (Chen, Scardamalia, Acosta, Resendes, & KICI , 2013).

ASSESSMENT OF IDEAS AS A RESULT OF IMPROVEMENT IDE

Along with the construction process of knowledge appear, the idea is expected to be converted into the learning tentative results, including (1) the initial ideas that are being generated and contribute individually to the database community, (2) the diversification of ideas made possible through the sharing / exchanging of or associated with the initial idea, to (3) described ideas more refined or modified continuously by means of reflection collaboration between community members, and (4) ideas more promising and valuable

possible from opportunist integrating diverse and elaborated ideas into solutions more decent or coherent account to address the problem. When the idea of the results of change of process improvements that appear to be treated as a material object real world, the possibility for a group of knowledge-building or class to form a complex set of ideas (as recorded in the database) that emulates a community of knowledge or what Popper (1978) called the third world realities.

Through the improvement ideas, as a result of tentative on knowledge-building phase that is different, students are expected to gradually will work more valuable, the idea is feasible. So, the next relevant question to ask is whether business-improvement ideas that ultimately will generate ideas more quality which is beneficial to the community to solve the problem in question. One way to improve the quality of the idea may be to increase the quantity of ideas. As suggested in the study (1953) on the evaluation of ideas Osborn, the idea of quality is more likely to be produced if an adequate number of ideas can be generated first. Put the other , the quantity of ideas is an effective measure of the quality of the idea. However, other studies (eg, Connolly, Jessup, and Valacich, 1990; Graham, 1977; MacCrimmon & Wagner, 1994) also found that the correlation between quality and quantity is often thin or insignificant and some-sometimes even negative. Given this controversy, it would be appropriate to directly measure the quality of the idea itself as a way to assess the results of the improvement ideas in the last stages of construction knowledge. As the world's third object, the idea of working in a community of knowledge-building that has been abstract and recorded in an online database, improvement ideas that can be focused on the identification of progressive ideas more innovative posted on the Forum of Knowledge (ie, whether this idea is able to solve the problem , solve problems, or design better products) (Chen et al., 2013). in particular with regard to product design technology, ideas more innovative is an idea that can make the product more useful in everyday life. For example, , Brown (2009) offers a set of criteria to assess the quality of ideas, using feasibility, feasibility, and desires. Dean, Hender, Rodgers, and Santanen (2006) developed a scale for the evaluation of ideas in which the following criteria are employed, including new things, " the extent to which the original idea "; workability, "the idea can be implemented (feasible) if it can be easily implemented and does not violate constraints note"; relevance, "[an] idea applies to other issues and would effectively solve the problem"; specificity, "the specific idea if obvious (work in detail)" (p. 663). With proper assessment, members of the public will be more likely to eventually produce

valuable ideas and promises and assume responsibility for collaborative improvement ideas for the overall advancement of knowledge in their community (Scardamalia, 2002).

CONCLUSION

The purpose of this study was to know how to improve students understanding methods in order to develop the capacity of students to work together and innovative ideas and to help them develop a better view of the role of ideas for their professional knowledge TEP. Two main thing in this study are: 1) how the student engaged in building knowledge that will help them improve their knowledge of the profession TEP collaboratively in groups in the perspective of live base leaning, 2) how students are more involved in constructing the knowledge to develop a better view to see ideas as objects essential for sustainable knowledge working in the perspective of live base leaning.

Research is very important for students and managers of the Department of Education Technology, State University of Malang. In addition to obtaining optimum benefits to the concept of learning. Student 1) get a strengthening of the concept of learning by focusing on learning capacity. 2) students get the knowledge to do innovative learning model and comfortable; 3) students can also feel the effectiveness of learning from learning model; 4) Students can learn the attitude of learning to live based learning to the learning model. The study learning object is a bridge perspective on pembelajaran yang method using information and communication technology media.

SOCIAL STUDY LEARNING MODEL DEVELOPMNENT BASED ON SOCIAL INQUIRY TO CREATED SOCIAL CONCERN AMONG ELEMENTARY SCHOOL STUDENT IN BLITAR CITY

Suminah

State University of Malang, Indonesia

E-mail: suminah.ksdp.pp3@gmail.com

ABSTRACT

This study uses a design development model of Borg and Gall (sukmadinata modification) include : (1) preliminary studies, (2) development of models. (3) model test used a qualitative descriptive approach. Data collection: interviews, literature review, and observations of teaching activity by teacher, distributing questionnaires. The result (1) an social inquiry – based on social study learning model. And alternative learning model that bring student to real learning experience like feeling, proving, rather than memorizing and communicating. (2) studnt learning activities show an improvement of problem solving ability (3) increasing student creativity not only did passive learning activity but also they can observing, comparing, analyzing, identifying, and proving. (4) friendly and fun team work building. The result of the research will be packaged in CD of learning that included social study learning strategies based on social inquiry.

Keywords: learning model, learning activites, social inquiry, character building, social concern.

Social study in curriculum 2006 is the subject of matter that discussing, analyzing the fact, concept and generalization from social problem in civilization from many kind of life aspect. According to it the aim of social study is make student can understand the concept about the real life in civilization and connection with environment, have ability about logical and critical think skill, curiosity, inquiry, problem solving, social interaction skill, team work, and having consciousness about social value and human right.

The social study character above show that the teacher have to make the learning process can be active and innovative for student. But the fact show that social study evaluation result always below the minimum score criteria. According to it meant that the teacher didn't teach the class with right learning strategy. Because of it and according to the research result from Siti Khotimah 2009 "improvement of learning activity and thinking skill through social inquiry in social study at fourth grade of SDN Manuwari, Bangil, Malang. Show that the teacher have less ability to implementating about social inquiry and thinking ability of student isn't active and creative yet. So the learning activity haven't show unsuccessfully. According to result above the researcher want to following up about it result and focused to develop learning model for social ctudy in elementary school based on social inquiry especially in blitar city region.

Joyce (Gulo, 2005) tells about general conditions to started inquiry activity for student, like: (a) social aspect in class and open mind situation to penetrate discussion activity among student. (b) focused on hypothesise test (c) using a fact as evidence and using validity, realiability about fact in learning activity for hypothesise testing.

METHOD

Developed learning model of social study in this research used development model from Borg and Gall (sukmadinata modification) there are three main step according to model above : (1) preliminary study (2) model development (3) model test, information source, data analyzing technic and it instrument, information validations.

In the first step, preliminary study is the first step that being preparation step for model development. In this step includes: (1) literature review, (2) field observation (3) first product formulated. Second step includes: learning model test program, in this step there are two way of development : (a) limited subject test, (b) whole subject test, and the third step is product test to tested about effectivity of it product rather than usual learning model in the school that have been used before.

Information source in this research are student and the teacher among elementary school in sananwetan district in blitar city. That have ability to did implementation learning model based on social inquiry includes : (1) information about many kind of social study learning model in elementary school (2) learning and teaching activities condition in class (3) social study learning model for reach objective of learning that used by teacher.

Information gathering technic that used is field observation, questioner spreading, and documentation activity. And information that gathered will be descriptive and percentage analyzing.

Information that gathered will be analyzing by followed procedure like : (1) information validating (2) tabling and information coding (3) information classification (4) information identification (5) data processing, (6) result decided,(7) information interpretation activity.

According to procedure above will be know about : (1) many kind of social study learning model in elementary school (2) how social study must be done (3) determine right learning method of social study that used and develop by teacher in learning and teaching activities in class.

The result will be validating according to determiner technic in qualitative research, from internal validation there are two way of validation : (1)collaborated checking is kind of validating that doing by two observer to guaranteed the information.(2) perseverance of observer is checking process that doing twice to validated the information.

RESULT AND DISCUSSION
Results

Based on information that found in 16 elementary school as subject of observation it found differentiate result that all of that almost have similarity each other.

In the first step, preliminary study is the first step that being preparation step for model development. In this step includes: (1) literature review, (2) field observation (3) first product formulated, literature review is the discussion activity to study about kind of concept that relevant with the product or model developing.

Result of the research in the first observation and interview from 6 elementary school teacher as limited subject observation, about demand of student interactive to learning process are causing few think below: (1) student didn't have courage to ask their teacher, (2) student didn't have confidently to answer from their teacher question, (3) student show passive learning activity during learning process in the class., (4) demand of example about social character among friend.

According to result above it caused few resistant to understanding the topics of social study to build social concern among character and the teacher. (1) student, the topics is not understanding or less understanding, (2) teacher, when do teaching activity look very passive and monotone, (3) uncertain of learning media (4) the topics is to wide and hard to figure out by student.(5) the lesson topics is not attract student to questioning activity. (6) less of example from teacher about good activity. Rather from teacher (1) the topics only from

text book or student book (2) the teacher didn't want to developing the topic it self (3) teacher have less ability to use media, methods, model of learning to support learning activity in class.(4) teacher only counting on student exercise book.

According to the result from observation activity we can conclude that social concern character building in social study is only from teacher centered and less involved media of learning. During the learning activity teacher only do narrative explanation, giving example to solve the problem in student exercise book, giving task to student from it book, based on that activity student creativity will be restricted and causing learning activity from student will be only write down what their teacher said, and only do the task from the teacher, to know about student learning result from inquiry model from research are writed below.

According to learning activity result after and before observation activity in SDN Karangtengah 1 the teacher didn't use social inquiry learning model for social study is not success yet, it causing the result of learning activity from 10 of 29 student is still below minimum standard value. The average of their value is only 64,9 from it learning activities. It meant that standard score for reach objective of learning only 34,5% from limited standard score that reach score up to 75% . and after teacher implementate social inquiry model of learning the average of student score are increasing. The students that have above limited standard score reach 21 student and the other is keep in below minimum standard score. The student score average are 75,5 from it learning activity. It meant that minimum standard score of the student are reaching 72,4 % and student that not qualified yet is only 27,6 %. From it result we can conclude that after observation activity be done the mostly score of student were increasing above limited score standard.

Based on information about student score after and before observation in SDN Sentul 3 the teacher didn't do social inquiry learning model in social study learning process yet. It result can viewed from limited standard score that reach 75% the student that reach above standard score only 9 students and 21 student else are below standard score. Average score from 30 student of its class are reach 70.00 from it learning activity. It meant that limited standard score of student are only 30%. And after implementation of social inquiry the result of student score showed 26 student are above limited score standar and the others are still below standard score. Score average that student has 84,2. Average of standard score of student are reach 86,67% and and only 13,33 % of them still unqualified.

According to student score after and before observation activity in SDN Plosokerep 1 it show

that the learning activities wasn't do social inquiry model and caused the aim of learning weren't reach yet. It viewed from limited standar score that reach 75% the student that have score above it standard only 6 student and 15 other student still below standard score. The average score among student are only 68,7 and it meant that student standard score are only 70% from limited standar score. And then after enquiry social model being doing the student average score are increasing. It showed that average score of student are 78,62 and standar score of student are reaching 100 % so whole student are above standard score.

Based on information about student score after and before observation held in SDN Sentul 1 we can know that the learning activities wasn't used social inquiry yet so the objective of the learning weren't reach yet. It can show from limited standard score that reach 75% the student are having score above the standard are only 7 student, and the others are in below standard score. Average score of student are 65,7 and it meant that student that qualified only 29,17%. And then after social inquiry learning model held the student are having score above standard score are 17 student and 7 others student still below standard score. And the student score are reach 70,83% while the student that unqualified only 29,17%. It show that the learning activity is successfully.

According to the result after and before observation doing in SDN Bendogerit 1 it can conclude that the learning activities before using social inquiry wasn't success yet. It can showed from the limited standard score that reach 75% student are having score above it number are only 12 students and 22 others students still below limited standard score. Score average of student reach 71,05 and it meant that student that have qualified according to aim standard score are only 35,29%. and then after social inquiry model have be done by teacher the student that have score above limited standard score are 30 student, and 4 others student still below limited standard score. Qualifying score according to it result were reach 88,2% and student that still unqualified only 11,76%.

According to the result after and before observation doing in SDK Santa Maria data it can explain that the learning activity that held before using social inquiry wasn't success yet. It can show from limited standard score that reach 75% student are having score above it standard are only 8 student and the others still below standard score. Score average of student only 66,45 it meant that student are qualifying only 33,4% from limited standard score. While

social inquiry model used by teacher the number of student that having score above standard score are 23 students and the student that unqualified only 1 student. Qualified Standard score reach 96,66% and only 4,66% still unqualified.

Based on less of student creativity and student attractive to join social study learning activity and less of teacher ability to use it model of learning the researcher and the teacher were held collaborated activity to use social inquiry in social study. To intention of increasing activity, creativity of student and student attractive to social study, developing discussion habituate to solve the problem in learning activity, increasing social study learning quality and it will be used on other subject of matter , and also increasing teacher professionalism to do their job. Result of it research are increasing activity, creativity, team work,and happiness when join the social study among teacher and student.

According to data that gathered from field observation and accused to theory and concept about it development the researcher formulated first product draft for development activity. It draft will be checking and validating by researcher team and teacher that have enough experiences about social study. According to first observation result the researcher conclude that from 6 limited subject of the test will be separate tofew classification like good, medium, enough, and less. And whole subject test for the other elementary school in blitar city.

Before it research did among limited subject. Each teacher from the subject were invited to make lesson plan using social inquiry learning model. When the teacher have finished making lesson plan the teacher will try to held teaching activity based on it new lesson plan and the researcher will be evaluated the learning process with observation, documentation and recorded about it learning activity.

According to advices from researcher the teacher will be change the materials or part in lesson plan that have any mistake. The researcher will give validating result for teacher to used as comparison about lesson plan that they made before. After limited test activity held, the researcher will discussed to prepare observation test to whole subject of observation.

Below are the teacher ability in limited subject test about social inquiry development in social study :

First, it show from learning activity that teacher bring picture about kind of rare and protected animal in Indonesia as media of learning to attract student for analyzing about it problem

Second, it show from teacher ability to explain about topic that have been supported by media of learning (rare and protected animal

picture in indonesia) and to penetrate student held inquiry process in group like find where the areas of it animal population and what the name of it animal and will be sticked in picture of Indonesian map.

Third, it show from student inquiry activity to stick the picture in Indonesia map according to where the population area and it held by student team work

Fourth, it show from analyzing from each team about the picture and each team have to make some question about it picture and it question will be change to another question from another team.

Fifth, it show from communicating activity that doing by one of the team group whom will be read the result of discussion in front of the class about the origin of its animal, how to do conservation, how to give concern about nature and wildlife, and how to stop the extinction of it animal kind.

Sixth, it show from student activity to show about Indonesian archipelago, many kind of animals and plants, through song and dance like "sabang sampai merauke"

Benefit of social inquiry from social character building are below: a) Developing student ability to make decision making to solve some problem with objectively and confidently; b) Developing thinking ability includes (observation, read the information, analyzing, etc); c) Through inquiry thinking ability above will be analyzing based on situation or condition that truly being concentrated; d) Guiding wondering attitude and objective – confident thinking, critical thinking in individual or group thinking; e) Developing social concern about social activity or social problem that happened around them.

And the less from it result is the teacher didn't understand yet about social inquiry model and it caused the duration for observation take too long.

Disscussion

Data that gathered from 16 school as subject of it research among the social study teacher in blitar city with classification below. 6 school as limited subject and 10 shool as whole subject. Limited subject test includes SD Karang Tengah 1, SDN Sentul 3, SDN PlosoKerep 1, SDN Bendogerit 1, SDK Santa Maria. And then for whole subject includes SDN Rembang 1, SDN Kauman 3, SDN Bendogerit 2, SDN Gedog 2, SDI Kardina Massa, SDI Kota, SDN PanjenLor 2, SDN Bendo 1, SDN Tanggung 2, SDNSananwetan 3.

Whole Questioner that spreading were gathered and the data presentation about

development of social study learning based on social inquiry in social concern activity contain 5 kind of activity like;

1. Developing social inquiry of social study based on National Education Standard (BSNP) In KTSP curriculum.
2. Social study learning model development based on social inquiry through social concern activity.
3. Developing and formulating lesson plan
4. Developing of learning step in social study learning model based on social inquiry.
5. Teacher perception about social study learning model based on social inquiry.

Based on information gathered about Social study learning model development based on social inquiry according to National Education Standard (BSNP) In KTSP curriculum in limited or whole subject test found as below: (a) function implementation from Social study learning model development based on social inquiry (b) learning activities to implementation objective of learning in Social study learning model development based on social inquiry (c) activity in Social study learning method development based on social inquiry. From kind of factor above it found highest percentage for very good (50%), good category (25%), and enough category (25%) it result show that development program on moral education based on VCT are in enough condition because the percentage between 70% - 84%(marzuki, 1999:27)

According to Social study learning model development based on social inquiry to build social concern about (a) implementation of concern approach (b) implementation of social analyzing approach (c) implementation of character building approach. All of that factor show highest percentage for very good (50%), good category (25%), and enough category (25%) it result show that Social study learning model development based on social inquiry to build social concern are in good condition because the percentage between 70% - 84%(marzuki, 1999:27)

From information about Developing social inquiry of social study based on National Education Standard (BSNP) In KTSP curriculum from 6 respondent show that: (a) implementation of function implementation from Social study learning model development based on social inquiry, 3 respondents has very good category (50%) , 3 respondents has enough category (50%); (b) learning activities to implementation objective of learning in Social study learning model development based on social inquiry, 3 respondent has very good category (50%), 1 respondent have good category (16,67%), 2 respondent has enough category (33,34%); (c) activity in Social study

learning method development based on social inquiry,, 3 respondents has very good category (50%) , 3 respondents has good category (50%).

Based on data about lesson plan making show the result as (a) formulated the objective of learning (b) developing lesson source activity (c) lesson strategic and scenario development (d) class manajement (e) evaluation procedure planning (f) presentating lesson plan document.All of that factor show highest percentage for very good (50%), good category (25%), and enough category (25%). it result show that lesson plan making is in enough condition and placed between 70% - 84% (marzuki, 1999:27)

From information about Social study learning model development based on social inquiry to build social concern as below (a) implementation of concern approach, , 3 respondents has very good category (50%) , 3 respondents has enough category (50%) (b) implementation of social analyzing approach, 4 respondents has very good category (66,67%) , 2 respondents has good category (33,33%) (c) implementation of character building approach,5 respondents has very good category (83,33%) , 1 respondents has enough category (16,67%).

Based on data about lesson plan making show the result as (a) formulated the objective of learning, 4 respondents has very good category (66.67%) , 2 respondents has enough category (33,33%) (b) developing lesson source activity, 2 respondents has very good category (33,33%) , 3 respondents has good category (50%) 1 respondents has very good category (16,67%); (c) lesson strategic and scenario development, 3 respondents has very good category (50%) , 3 respondents has good category (50%) (d) classmanajement, 1 respondents has very good category (16.67%) , 2 respondents has good category (33,33%) 3 respondents has enough category (50%) (e) evaluation procedure planning, 3 respondents has very good category (50%) , 3 respondents has good category (50%) (f) presentating lesson plan document, 3 respondents has very good category (50%) , 3 respondents has good category (50%).

Based on data aboutSocial study learning model development based on social inquiry to elementary student.it show (a) determining about value that will be discussed,5 respondents has very good category (83,34%) , 1 respondents has good category (16,67%); (b) determining about relevan activity, 1 respondents has very good category (16,67%), 5 respondents has good category (83,34%); (c) problem concern activity, 3 respondents has

very good category (50%) , 3 respondents has good category (50%); (d) searching and finding concern object, 3 respondents has very good category (50%) , 3 respondents has good category (50%); (e) social concern analyzing, 3 respondents has very good category (50%) , 3 respondents has enough category (50%), (f) determining the reason about social concern activity, 3 respondents has very good category (50%) , 3 respondents has good category (50%).

According to data analizing about teacher perceptionaboutSocial study learning model development based on social inquiry, it found (a) social inquiry understanding, 3 respondents has very good category (50%) , 3 respondents has enough category (50%); (b) learning step development in social inquiry, 5 respondents has very good category (83,34%) , 1 respondents has enough category (16,66%); (c) social inquiry socialization, 3 respondents has very good category (50%) , 3 respondents has enough category (50%); (d) demand of guidance book for social inquiry learning process, 3 respondents has very good category (50%) , 3 respondents has enough category (50%),

In this case almost all the teacher perception are needed the tutorial book for social inquiry learning model in social study to held character building for student about social concern

CONCLUSION AND RECOMMEDATION
Conclusion

Based on the problem, aim, and result of the research and the discussion result it can conclude that the observation have few result as below : lesson plan of Social study learning model development based on social inquiry, model and strategy of social study based on social inquiry that have validation and have ability to implementation activity in the class. All of the result which have been not detailed above will be recorded in CD of learning and teacher guidance book that contributed to the real implementation of Social study learning model development based on social inquiryand to reach an objective or learning itself.

Recommendation

The result of the research show that all the model of learning strategi in elementary school developing program are valid as theoretic aspect and can put into practice in learning process and effectively reached to aim of study. So it advised to the teacher in elementary school to have ability for implementation strategic model on this research in the teaching and learning process at school. Especially for integrated curriculum learning process.

MAPPING OF STUDENT COLLEGE PERCEPTION AND EXPECTATION ON FUTURE CAREER

Sunarni; Wildan Zulkarnaen; Erny Roesminingsih; Sulasminten
State University of Malang, Indonesia
Email: sunarni.fip@um.ac.id

ABSTRACT

This research aims at: 1) mapping of student college perception, 2) mapping of college student expectation on department, 3) finding out the differences of college student perception and expectation. This research uses descriptive comparative method. The population of this research is students of AP FIP UM and MP FIP UNESA. The number of sample is 248 respondents from 2012-2015 generation. Data is taken using questionnaire. The results are: 1) perception of college students to department is good, 2) expectation of college student is very high. 3) Based on university and gender group variable, perception and expectation of students there are similarities. However based on the academic year, college student's expectation is not the same. Based on university and gender group variable, perception and expectation of students there are similarities. However based on the academic year, expectation of student college is not the same.

Keywords: mapping, perception, expectation, future career.

Human resources is nation asset. BPPK (2016) Theodore, W.Schultz presentation of article entitling Investment in Human Capital in 1960 in front of economic experts and officials of *American Economic Association* is the founding father of *human capital concept*. Fattah (2004), in viewing human capital concept stated that basically human is a form of capital. Human as a human capital is reflected in the form of knowledge, idea, creativity, skill and productivity. Not similar with other capital objected as *tools*, human capital may invests themselves in the form of several human resources investment, such as formal education, informal education, working experience, healthy, nutrition and transmigration. Ancok (in BPPK, 2016) stated that human capital is regarded as a very important component in organization. Human with all capabilities will result in awesome performance if they are explored maximally. The followings are six components of human capital: (1) intellectual; (2) emotional; (3) social; (4) consistency, (5) moral; and (6) healthy capitals.

Human resources existence is the most important component of people life prosperity. It needs education to reach prosperity. Education has very important role in life because it becomes a long life investment which can be regarded as economic commodity. Someone education can be measured by skill and knowledge that can be valued from economic value side.

Someone who succeeded in education doesn't mean that they will succeed in post-education. Basically, education is expected to give refund in the form of successfulness in achieving dream which can be realized by the development of working field that in last will produce prosperity. Prosperity will not be achieved easily. It needs patience and consistency so that it will not create jobless generation.

Indonesia is regarded as a nation which reaches successfulness in improving education. Knowledge understanding improves significantly, which can be seen from the high number of higher education delivering their output. Unfortunately, not all higher education graduates are accepted by working field. It is expected that they can enter formal sector and develop future career. Kompasiana (2014) stated that career is defined as all kinds of job, whether it earns money or not. Career is also defined as learning process and roles of human life. Career is related to any jobs of earning money and belongs to a single job. Career is viewed as learning process and simultaneously self-development. According to Pekerti (2008), factors influencing career are culture, discrimination, subjective, careers, Confucian values and family business structure.

A study conducted by Jannah (2006) found that self-concept and social support influences future career anxiety, but self-concept influences more on career anxiety. Based on first minor hypothesis it is found that self-concept influence future career anxiety, meaning that this hypothesis is accepted. It can be assumed that the higher the self-concept, the lower the career anxiety. In contrast, the lower the self-concept, the lower the career anxiety. Based on second minor hypothesis it is found that social support doesn't influence future career anxiety. It means that the second hypothesis is rejected.

Due to the imbalance of graduate number and job field, educated jobless is resulted, and it is a new task for this nation. Based on survey from BBC on July 2009, educated jobless level in Indonesia is 8.25% (Wikipedia, 2013). In 2016, however, the jobless in Indonesia fell down (BPPS, 2016). The Head of BPS (Statistical Centre Organization), Suryamin, said that open jobless in February 2016 is 7.02 million (5.5%). This number, nevertheless, fell down compared to February 2015 which was about 7.45 million (5.81%). The jobless percentage of primary school graduates and below also fell down, from 3.61% to 3.44%. The highest jobless number is from the graduate of vocational schools, from 9.05% to 9.84%.

Jobless is defined as a group of working generation who wants to get job but they have not got job yet (Supriatna, 2007: 293). Educated jobless, therefore, is a graduation from higher education, both public and private, who has not got job yet. Educated jobless usually comes from middle to top community, in which they have opportunity to earn live while they are jobless. Educated jobless relates mostly to educational problems in developing countries. The problems usually consist of educational quality, teacher preparation, facilities, and lack of working field that eventually give effects to social and educational existence in community way of view.

A research conducted by Lestari (2014) suggested that from total number 196 university 56 students, 47 belongs to high category, 142 in middle category and 2 students belong to low category. Categorized from aspects of knowledge, attitude/behavior and skill during educational stage, job field and type, job income and location, it is suggested that 142 students high expectation, and 54 in middle expectation. 131 students run into educational sector and 65 students in non-educational. There is also difference on students perception based on generation era and parents income variables. There is no difference on students perception based on sex, parents education and occupation variables.

Higher education should deliver graduates who are categorized into jobseeker, but as entrepreneur who has high skill, knowledge, concept and strategy that it leads them into successfulness in the future (Hendro, 2002). Entrepreneurship is an alternative to reduce educated jobless. According to Zhang (2014), Establishment of Enterprise Education System for Undergraduates in Universities: 1) Improving students' cognition on entrepreneurship, 2) Adjusting teachers' educational philosophy, 3) Carrying out various forms of entrepreneurship courses and trainings, 4) Flexible team learning can be carried out, and 5) The attention from universities and schools to students' entrepreneurship should be enhanced.

Every college student is important to have perceptions and high expectations towards the future career. Wursanto (2005) and Mansoer (1989) argues perception is the process of organizing the provision of meaning/sensory impressions translate/interpret the message by a person on the environment.

Expectation is something that (can) be expected, the desire to become a reality (Indonesia Dictionary/Kamus Besar Bahasa Indonesia, 2016). Expectation someone depends on a person's background, experience, education, knowledge, environment, and the ability of each individual.

METHODS

This research uses quantitative approach with comparative descriptive design. Research object is students of Educational Administration Department, Faculty of Educational Science Malang State University (AP FIP UM) and Educational Management, Faculty of Educational Science Surabaya State University (MP FIP UNESA), from 2012 – 2015 generation. The number of students is 248, consisting of 138 and 110 from students of AP FIP UM and MP FIP UNESA, respectively. Research sample is taken based on KrejcieTable, in which it is taken using *Proportionte Random Sampling* based on students' generation. From the population of 743 students based on Robert Krejcie and Daryle W. Morgan formula, the researcher got 248 students sample. Data collecting technique is questionnaire. The data is analyzed using SPSS for Windows, cross tabulation descriptive and t-test technique.

RESULT AND DISCUSSION
Result

The result of data analysis suggests that there are 248 respondents from two universities, Malang State University and Surabaya State University. There are 138 students from AP FIP UM department, consisting of 30 male and 108 female students, and 110 from MP FIP UNESA, consisting of 19 male and 91 female students. Based on the generation year of AP FIP UM students, there are 32, 35, 35 and 36 students from academic year 2012, 2013, 2014 and 2015, respectively. For MP FIP UNESA, there are 27, 27, 29 and 27 students from academic year 2012, 2013, 2014 and 2015, respectively.

Students' perception category to department, both AP FIP UM and MP FIP UNESA, is categorized into high (158 or 63.7%), very high 84 (33.9%), moderat 6 (2.4%), low 0 (0%). Students'

perception category to department can be seen in Table 1.

Table 1. Students' Perception Category to Department

	Frequancy	Percent	Valid Percent	Cumulative Percent
Valid Low	0	0	0	0
Moderat	6	2,4	2,4	2,4
High	158	63,7	63,7	66,1
Very High	84	33,9	33,9	100,0
Total	248	100,0	100,0	

Results of cross tabulation on students' perceptions of the UM Department of AP and MP FIP FIP UNESA can be seen in Table 2.

Table 2. Results of Cross Tabulation on Students' Perceptions

	Category Perception			Total
	Moderat	High	Very High	
UM	3	87	48	138
UNESA	3	71	36	110
Total	6	158	84	248

For students expectation, the categorization is very high (192 or 77.4%), high 54 (21.8%) and average 2 (0.8%). Students expectation can be seen in Table 3.

Table 3. Category of Students' Expectation

	Frequancy	Percent	Valid Percent	Cumulative Percent
Valid Low	0	0	0	0
Moderat	2	0,8	0,8	0,8
High	54	21,8	21,8	22,6
Very High	192	77,4	77,4	100,0
Total	248	100,0	100,0	

Results of cross tabulation on students' expectation of the UM Department of AP and MP FIP FIP UNESA can be seen in Table 4.

Table 4. Results of Cross Tabulation on Students' Expectation

	Category Expectation			Total
	Moderat	High	Very High	
UM	1	23	114	138
UNESA	1	31	78	110
Total	2	54	192	248

Different-test analysis based on university between AP FIP UM and MP FIP UNESA, Perception of college students get Asymp.Sig (2-tailed) of 0,952> 0,05 means Ho is accepted. This means that there is no difference between the perception of UM students with MP AP FIP FIP UNESA. Expectation of college students get Asymp.Sig (2-tailed) of 0,202> 0,05 means Ho is accepted. This means that there is no difference between the perception of UM students with MP AP FIP FIP UNESA.

The results of different test analysis on the perception of students by gender between students and MP FIP FIP UM UNESA, get Asymp.Sig (2-tailed) of 0,095> 0,05 means Ho is accepted. This means that there is no difference between the perception of UM students with MP AP FIP FIP UNESA based of gender. The results of different test analysis on the expectation of students by gender between students and MP FIP FIP UM UNESA, get Asymp.Sig (2-tailed) of 0.202> 0.05 means Ho is accepted. This means that there is no difference between the expectation of UM students with MP AP FIP FIP UNESA based of gender.

The results of different test analysis on the perseption of students by Academic Year between students and MP FIP FIP UM UNESA, get Asymp.Sig (2-tailed) of 0,348> 0,05 means Ho is accepted. This means that there is no difference between the perception of UM students with MP AP FIP FIP UNESA based of academic year. The results of different test analysis on the expection of students by student level between students and MP FIP FIP UM UNESA, get Asymp.Sig (2-tailed) of 0,010> 0,05 means H1 is accepted. This means that there is difference between the expection of UM students with MP AP FIP FIP UNESA based of Academic Year.

Table 5. Different-test Analysis Result based on University, Sex and Academic Year

No	Grouping Variable	Differentiation	Asymp.sig (2-tailed)	Note
1	University	Students' Perception	0.952	H0 accepted
		Students' Expectation	0.202	H0 accepted
2.	Gender	Students' Perception	0,095	H0 accepted
		Students' Expectation	0,202	H0 accepted
3.	Academic Year	Students' Perception	0,348	H0 accepted
		Students' Expectation	0,010	H1 accepted

Discussion

Based on the research results the college students perceptions is high katogori. Perceptions are formed through a gradual process, there are factors that affect the perception. Siagian (2004) and Robbins (2003) in general, there are three factors that influence a person's perception, among others: (1) Of the people who shape perception itself. If someone saw something and tried to give the interpretation of what he saw, people are influenced by the individual characteristics that helped influence such attitudes, motives, interests, interests, experiences and expectations. (2) object of perceptions. Object of perception can be a person, object or event. The properties of the target (movement, sound, size, behavior and other characteristics) of the target perceptions also determine the way people see it. And (3) factors of the situation. Perception must be contextually meaningful in situations where the perception that arise need to get attention. The situation is a factor that contributed to the growth of a person's perception. It can be concluded that the perception is influenced by one's personal, goals, and situation.

Perception to produce a thought, pass through a process certain stages. Perception is essentially an observation through the sensing of an object, then forwarded by the sensory nerves to the brain. In the brain, the results of these observations are processed consciously, so that the individual concerned may be aware of and give meaning to the object being observed in accordance with attention, needs, system of values, and personality characteristics. The stages include: 1) The first stage with respect to the stimulus. Stimulus arrested sensory nerve is affected by certain conditions, such as individual attention, a factor the stimulus itself,

motivational, and individual experience. These factors determine whether the stimulus is received or not. 2) When people prepare to receive a stimulus, stimulus all the time come up with a value to the individual. Whether the stimulus is a scary thing or a thing that attracts attention and so on. Values for individual stimulus actually directs the individual to the object of perception, which means according to the individual expectations. 3) Establishment of perception, this stage is determined by the function of the receptor organ (receiver) and the characteristics of the projection area. In other words, the formation of this perception is closely related to physiological function. This function is developed in accordance with the pattern of growth and development of the individual. 4) The length of time between the receipt of stimulus stimulus for formation of shadows on the projection area of the brain tissue. The length of time can be measured by looking at the high and low sensitivity and equality stimulus functions in the projection area to outside stimulus. 5) consolidation phase shadows stimulus, at this stage there is an understanding of the sensory nerve stimulus received. Meanings of the stimulus occurs after people perform a selection of some stimulus. A stimulus that comes with a certain value for the individual to be responded to and given meaning. The stimulus meaning given in accordance with the structure of its cognition.

Category expectation based on analysis result of data is very high. It is claimed that the student has Expectation to the university for realize their desire become a reality in the future is very high. It will support survey result from BBC News stating that educated jobless in Indonesia will improve year by year. To realize their parents' expectation as civil servant, most students compete hardly.

A research on career choice by university students (Widyasari, 2010) suggests: 1) there are students' perception differences on career choice based on salary, professional training, professional admiration, social values, working environment, job market consideration; 2) there is no students' perception difference based on personality factor. Keseger (2013) suggests that career development and self-efficacy in unity has significant influence on worker performance, but when the two factors are separated, the influence is different. Career development influences significantly on worker performance, while self-efficacy has no significant influence.

Hendro (2002), therefore, states that university should prepare students with skill, knowledge, concept, and strategy in entrepreneurship so that they may have bright career in the future. Wyness, Jones &Klapper (2015) in their study proposes three ways in which

sustainability might be more meaningfully integrated into entrepreneurship programs. First, the QAA (2012) guidelines for enterprise and entrepreneurship need to be reconsidered to encapsulate the sustainability agenda. Second, for entrepreneurship educators to reconsider their pedagogical approaches to encapsulate system thinking as more holistic educational perspective. Finally, the authors call for entrepreneurship educators to revise their programs to embed the core facets of social, environmental, economic and more recently ethical sustainability, originality/value. The study offers a novel insight into entrepreneurship educators attitude to sustainability and their approach to it within their curricula.

A person who has design on their future has the following characteristics: 1) more meaningful life, 2) higher level of happiness, 3) better academic performance, 4) less problem in school, 5) higher participation in school, 6) higher sense of belonging, 7) lower depression level, 8) lower risky behavior (sexual relationship in early age; pregnancy or to be the cause of pregnancy; smoking, drug, alcohol; crime, and others), 9) more positive view to ethnic. A study on future plan and career destination suggests that 49% students in USA has career destination in the future, and 51% does not have. The details are as follows 1) graduating from senior high school or getting good score (4%), 2) continuing study in university but no specific purposes (10%), 3) specific career that can be reached if they get degree from university (7%), 4) specific career without having degree from university (14%), 5) career in entertainment or sport sector (4%), 6) not certain or not knowing (7%), and 7) no answer or answering but outside the career (44%) (Mendatu, 2014).

Study from Hulukati (2014) suggests that there is a perfect correlation between career guidance and students' self-efficacy of second year of SMK Negeri 1 Gorontalo students in choosing their study, in which it is shown by xyr price = 1000. By determining cooeficient = 1000 (100%) it shows that 100% variation in students' self-efficacy in choosing their study is explained by career guidance.

Students' perception to department or study field is high, and students' expectation after graduating from university is very high. It is in correlation with study result conductedby Lestari (2014). It suggests that from 196 university students, 47 belongs to high perception category, 142 belongs to middle perception category, and 2 has low perception. Expectation to knowledge, attitude/behavior

and skill during studying in university, working sector, type of job and working location shows that from 196 students, 142 has high expectation and 54 in the middle.

CONCLUTION

Based on the study, it is concluded: 1) perception of college students to department is good, 2) expectation of college student is very high. 3) Based group variable on university, gender, and academic year , perception of college students there are similarities. Based on university and gender, expectation of college student there are similarities. But, Based of academic year, student college expectation is not the same.

THINKING HISTORICALLY WITH DOCUMENTS: SOME PROPOSED INSTRUCTIONAL STRATEGIES TO TEACH SOURCING

Susanto Yunus Alfian

SMA Negeri 1 Sumberpucung, Malang, Indonesia

Email: susantoyunusalfian@gmail.com

ABSTRACT

It is important that students develop and use appropriate historical thinking skills in the classroom. One of the historical thinking components is the sourcing component. The students are asked to analyze, evaluate, and infer historical sources. The purpose of using historical documents in the classroom is to make the students read and think like historians. In this context, this article focuses on the use of primary source documents to teach historical thinking to SMA Students. The implementation of the sourcing instructional strategies requiring students to think like a historian strategy is presented too. I present some instructional strategies to teach the historical thinking skill

Keywords*: historical thinking, primary source, document, source materials.*

Primary sources are now more readily available in much larger numbers through the internet. The quality and breadth of available sources has been increasing. The sources may include historical texts, narratives, or artifacts. Many collections also offer teachers guides on how to utilize documents within their classroom. The sources also offer many research possibilities for students. Primary sources are similar to the "raw material" that historians use to write about the past. Primary sources reflect the first-hand experiences and perspectives of people who lived in the past. Primary sources can be used to convey information about the past and provide insights into the thoughts and experiences of those who lived in an earlier time. It is widely believed that when teachers use primary source documents, students are more likely to engage in the process of historical analysis. Primary sources are different from books that are written by authors and published for sale in bookstores. Researchers use primary sources to write books, which are secondary sources.

Students learn that reading primary document differs from reading textbooks only in the particular questions they are expected to answer. But the goal-reading comprehension-remains the same (Neumann, 2010). Reading and thinking about primary sources should allow the students to come to their own conclusions about events and issues in the past. History textbooks was written by historians who used primary sources to conclusions about events and issues in the past. If the students want to challenge what they say, the students could use primary sources to get back to original events and perspectives in the past. Then, they could use the primary sources to come to their own conclusions. Using primary sources also shows us that there are multiple and sometimes different perspectives on the past. For those reasons, I would like to present the essence of what we call primary source document, heuristics and propose some instructional strategies.

DISCUSSION
Primary Source Document

Teachers are increasingly urged to include primary documents—records or evidence of the past created in the past—in their teaching of history and social studies (Sandwell, tt). Primary documents have clear advantages over textbook accounts. Historical documents such as diaries, photographs, letters, and even house-by-house census manuscripts provide personal points of entry into history. They can offer eye opening perspectives for students who believe that history is impersonal and therefore irrelevant to their lives. Criminal trials, inquests, and newspapers offer a sense of immediacy about the past, providing students with a window on history that is more urgent and interesting than textbook histories. However, the usefulness of primary documents is not limited to their ability to entertain students. Initially engaged by the immediacy or personal nature of primary documents, many teachers use primary sources as a "hook" to draw students into historical thinking. In the process of thinking critically about these documents, students develop a deeper understanding of the content—the larger events, themes, and issues of history—in meaningful ways that are likely to be remembered beyond the final exam. Students who learn to use primary documents effectively learn how to "do" history like historians, interpreting evidence to piece together a narrative of historical explanation

and to make richer sense of the everyday world around them.

Despite these advantages, their potential is not always realized for at least three reasons: difficulties in finding useful documents, challenges in using documents to advance an already crowded curriculum, uncertainty about how to teach students to analyze them critically.

Primary documents are those records created in the past, at or close to the time under study, that have survived into the present. Historians have traditionally used a wide variety of written records, from personal diaries created by a child to statistical records kept by government departments, as the foundation for their historical investigations. More recently, historians have been drawing on non-document records, including photographs, moving pictures, the spoken word, and even architectural plans or botanical (plant) inventories to find clues about how people lived in the past. All of these primary documents are, in an important sense, the "raw materials" that historians work with as they attempt to figure out what happened in the past, and what it means to us in the present.

Ultimately, primary documents are our sole sources of evidence about the past. But what they reveal depends on the questions that historians ask. For example, statistics about factory wages in Canada in 1914 might be used by a historian to prove any number of conclusions, including the following: women were paid less than men, the economy in Canada was in a slump in that year, Montreal was the leading manufacturing Centre in Canada in the pre-war years, the Canadian government was more interested in factory work (since it collected these kinds of statistics) than it was in child-raising practices (about which few statistics were collected).

When attacking the documents, we have limitations. Since the past must be understood through the medium of the sources, the truth is elusive at best. Only a portion of past events were observed and a portion of them remembered; still less was recorded and not all of the written record has survived to be used by the scholar. What the student works with may be distorted as well as incomplete, both factors which militate against the making of extravagant claims based upon any given piece of evidence. In the words of E. H. Carr, "no document can tell us more than what the author of the document thought--what he thought had happened, what he thought ought to happen or would happen, or perhaps only what he wanted others to think he thought, or even only what he himself thought he thought.

Heuristics

Historians discover knowledge by three heuristics: sourcing, contextualizing and corroborating. Historians sought out and evaluated the source of a document and used this source information to influence their interpretation of the document content (a sourcing heuristics). In this sourcing heuristics, historians search for the historical attribution before reading the document. They also tended to develop hypotheses based on sources before the actual reading of the documents. Historians also attempt to situate the events in an accurate spatial-temporal context (a contextualization heuristics). In this contextualization heuristics, historians place a document within the parameters of space and time. They construct timelines and geographic reference points from direct evidence contained in the documents and by drawing inferences. Historians compared content across documents systematically and were therefore able to identify discrepancies (a corroboration heuristics).

Sourcing. Evaluation of source information depends on initially identifying critical features of the sources. Historians evaluate the author of the document, including statements about the author's position, motivation, or participation, or an evaluation of the author in general. Position is a reference to an author's occupation, profession, or credentials. This is important because it indicates the author's educational training, affiliation with an organization or institution, and status as an authority. Motivation is a possible reason why the author may have written the document. Author motives are usually not explicitly mentioned and therefore the reader must infer them from knowledge aout the author or the type of document. Identifying possible motives is important for explaining why specific events or facts are mentioned whereas others are omitted, as well as for explaining why different persons and events are portray as they are. Participation is an indication that the author was (or was not) a participant in the activities described. It is about how the author came to know the information described, such as direct experience, scholarly research, newspaper, investigations, or fictional invention. Author evaluation is statement in which historians state their own opinion of the author.

Justification refers not to author characteristics but to characteristics of the documents: date and document type. Date is an explicit mention of the time period in which the document was written. Date is important because it helps to indicate how much information the writer could access and how accurate an account of the events from memory might be. Also, the author's perspective might be influenced by the time period

in which the document was written. Document type is a reference to the form of the document such as textbook, autobiography, treaty, scholarly book, or sworn disposition. The type of document can provide information whether it is a record without interpretation, interpretation evaluated by informed peers, a concise overview or summary of agreed-upon information, or mere entertainment. Finally, a document evaluations a statement of the historian's opinions of the document type.

A document is quite meaningless until the historian deciphers it through a thought process that screens for motivation, bias, intent, and context. The first insight gained by the student involves the realization that an effective assessment of a piece of evidence can only be made against an informed background. Recognizing that a historical document does not exist in a vacuum, therefore, he/she inquires into the events surrounding the piece of evidence under consideration. The ability to understand human behavior in its original setting by putting oneself "in the place of other individuals of other times and to interpret documents...with their eyes, standards, and sympathies" may be thought of as "historical-mindedness. Historical perspective is achieved when the "angle of view of participants is somehow brought into effective contrast with the quite different angle of view of today's observer.

Contextualization. Contextualization is the heuristic of attending to a detailed sequence of events in time and space when reconstructing the events from documents. The historians analyze the document and simulate the stated events to test hypotheses of plausible scenarios and reject other models as implausible. This requires the reader to go beyond the actual words stated in the document and therefore requires extensive knowledge and experience. There are six categories of the historian statements that reflect the contextualization heuristic. These categories include spatiotemporal, social-rhetorical, biographic, historiographic, linguistic and analogical comments. For example, source features such as a document's date could be used to construct an accurate event timeline as well as to interpret the particular linguistic context of phrases based on their usage in the period when written. Similarly, focusing on author motivation could help the reader create a social-rhetorical context to evaluate and interpret content.

Historical-mindedness leads directly to an appreciation of the fact that context is crucial to accurate interpretation of the evidence. The meaning of a document cannot be divorced

from "its own contemporary history." A critical element of historical thinking thus involves "the responsible use of evidence to fill out for the episode in question its place both in relevant developments down through time and in the context of its own time. "As he/she examines a primary source, the student is encouraged to ask: where does this document fit into the broader socio-economic-political-cultural environment of the era from which it is drawn?

A concern for context also necessitates an exploration of the background of the witness those writings are under consideration in the classroom. The student must be cautioned against an uncritical assumption that first hand material is always more reliable: the notion that a primary source is by definition objective. Discussion should instead stress the reality that "primary sources, produced in the heat of the moment, are automatically biased" and are to be used with "discriminating judgment" in order that the analyst arrive "a closer approximation of the truth." Indeed, critical examination of a document may aid the student in recognizing "the sources of bias in himself and his contemporaries no less than among the personages of history}."

Corroboration. Corroboration is the general skill of checking facts or investigations from a particular document against other, independent sources. Corroboration involves directly comparing the information from the various sources to identify which important statements are agreed on, which are uniquely mentioned and which are discrepant. It enables historians to differently weight the credibility of the information presented in a document. One's confidence in a document's credibility can be bolstered by the accumulations of corroborated information (i.e: information in agreement with other texts). Thus, when historians find a fact that another author mentioned, they can have more confidence in the accuracy of that information.

There are three types of uncorroborated information: unique, contradicted, and incomplete. First, a document may present unique information not presented by other documents. No single document will provide all possible details and causal explanations for the described situation. Unique information is helpful because it allows the historian to fill in a more complete set of events and motives. Unique information, however, also places a burden on the reader to hold that information on tentative until corroboration has been obtained. Second, a document may present information that contradicts information from other sources. The process of corroborating information against other texts allows the reader to identify such discrepancies. In this case, rather tan merely marking the information as tentative, the reader

must resolve the discrepancies and attempt to investigate the cause of the discrepancies to determine the extent to which an author is being deceptive or purposefully misleading. Finally, a document may present an incomplete version of the story by omitting important, generally agreed upon facts. This may lead the reader to question the credibility of the source in general.

Some Proposed Instructional Strategies
The Atomic Bomb

This project was completed by students (Anderson, 2013). They chose to research the creation and use of the atomic bomb at the end of World War II. They are asked to analyze and interpret. When doing historical analysis and interpretation, it requires them to go beyond the simple statement of facts by creating a narrative supported by historical evidence. Through this process they recognize that there may not be a simple answer toa question, but multiple interpretations. They struggle to look past the statement of facts to create an interpretative story of the past.

There are many perspectives from which to approach the topic. They discover a number of primary sources from Robert Oppenheim, Harry Truman, and Albert Einstein. These sources focus on the development and motivations to use the bomb. These sources are ripe for interpretation and could be viewed differently by the individual.

When interpreting, they have focused on stating the facts surrounding the event to create their final narrative for their project. They have interpretation that the American reactions to the use of the bomb: Americans are very happy and the war was going to win soon. They have also focus their attention on identifying the important individuals involved in the development of the bomb, the events leading up to the use of the bomb, important dates surrounding the event, and the important facts about the dropping of the bomb such as the cities, name of the plane and bombs, and the number of dead.

They could recognize the controversy and ethical dilemma faced by those involved in the bomb's creation and use. It demonstrates that they can identify a number of different perspectives. They can transform the information into their own unique interpretation of the event.

English Colony in America

The essential Question is "How can we understand contact, cooperation, and conflict between Native Americans, Africans, and European colonists in the colonial era"?

There are some important terms that the students should understand. (1) Bias, a prejudice; an inclination or tendency of temperament or outlook. Bias is evident in both primary and secondary sources. (2) facts Vs interpretations, —in historical writing, facts include information that is not under dispute, such as what happened, who was involved, and when an event occurred. Interpretations explain how or why something happened. (3) Perspective, —it is a point of view. (4) Primary Source—materials that have survived the past. Examples include—but are not limited to—letters, photographs, buildings, or articles of clothing. (5) Secondary Source—accounts of the past created by people writing about events after they happened. Interpretations of the historical record (primary and secondary sources.)

The students must distinguish primary from secondary sources. The table below lists several sources that a student might use for a research project on religion in early America. Please determine whether each document is a primary or secondary source, then, briefly explain your choice.

Source	Primary or Secondary Source?	Briefly explain your answer
1. Slave spirituals		
2. U.S. history textbook		
3. Documentary film on the First Great Awakening		
4. Wood engraving of a Quaker meeting from 1710		
6. Petitions of Accused witches from Salem witch trial in 1692		
7. Native Californian ceremonial baskets from the early 18th century		

The students must differentiate between facts and interpretations. Historians create stories that explain the past. They need to describe the facts—that is, what happened in the past as well who participated and where events occurred. But historians must also interpret how and why events or changes happened. History is therefore not just a recitation of facts. Rather, secondary sources offer readers a combination of facts and interpretations: (1) A fact indicates what happened, who was involved, and when it occurred (for example, the American colonies declared independence from Britain in 1776). (2) An interpretation explains how or why something happened (for example, colonists declared independence *because* they objected to British taxes, *because* they wanted to expand West, etc…) A good way to detect an interpretation is to consider whether you can think of a

counterargument (that is, an explanation that would argue the opposite).

The table below lists both facts and interpretations that a teacher researching the New World might find in either a primary or a secondary source. As you read each sentence, (1) Circle the word(s) or phrase that you think is most important, (2) Decide whether each sentence is a fact or an interpretation, (3) Fact: is the sentence only telling you what, who, when?, (4) Interpretation: is the sentence telling you how or why? And (5) Very briefly, explain your answer.

Research Finding:	Key Words:	Fact or Interpretation?	Briefly explain your answer.
1. English colonists established the settlement at Jamestown in 1607.	*established*	*fact*	This sentence explains what happened (settlement) and when (1607)
2. European colonists gained control of the New World through conquest.			
3. Race-based slavery was introduced to the British colonies in about 1619 and became institutionalized over the course of the 17th century.			
4. The period between 1492 and 1750 should be understood as a process of mutual discovery, not conquest.			

Perspective

We all know that two people can have a different view of the same event. The table below lists three types of people who might have lived in Virginia during the 17th century. Write a sentence or two explaining what the "New World" meant to each person. How might an Algonquin Indian chief, an African-born female slave, and a male English colonist have a different perspective (or point of view on the New World?)

Identity	Perspective on the New World
Algonquin Indian Chief	
English colonist	
African-born female slave	

Bias

A bias is a prejudice or a tendency to see something in a particular way. As you saw in the previous exercise, the discovery of the New World held different meanings to different groups of people. When historians conduct research, they often find that their sources disagree with one another. Sources have a bias: an opinion about whether something is good or bad that influences how a person or culture believes something should be dealt with. Factors like a person's race, class, gender, age,

or regional locale can create a bias and influence a person's account of events. Therefore, historians need to look at sources carefully and ask critical questions about them. The 6Cs offers one method of analysis.

The Slavery

This lesson puts equal emphasis on the history of the Trans-Atlantic Slave Trade and on the craft of forming historical arguments. Students are asked to read recent work from a leading historian of slavery. The author clearly presents a slave trade set against different and competing economies, nations, and technologies, but he draws on little primary source material, opening the door for students to locate opportunities to plug in original research they can do with the database. Then the class is prepared to have a productive discussion about what kinds of claims are harder to defend than others and why some types of evidence are more convincing than others.

The students will be able to use inductive reasoning to evaluate historical arguments, draw conclusions about the strength of different types of historical evidence, and develop a deeper understanding of the slave trade as terrain contested by diverse groups within the populations of Africa, Europe, and the Americas with different outcomes in different regions and at different times

Activities/Procedures will be as follow: (1) Assign students chapter 5, "The Atlantic Slave System: Brazil and the Caribbean," from David Brion Davis's Inhuman Bondage: The Rise and Fall of Slavery in the New World. Tell them to pay close attention to his overview of the chronology and fluctuation in strength of the colonial presence in the western hemisphere. (2) Have them independently (as homework or in class) take notes on the changes in the slave trade. Alternately (or in addition), the class could make a timeline charting the fluctuations of colonial involvement in the slave trade. (3) Divide the class into pairs and tell them to design questions to test Davis's narrative. For instance, Davis writes on page 103, "In the mid-to-late 1500s the Portuguese gradually transferred the system of sugar plantations worked by slaves from their Atlantic islands such as Madeira, São Tomé, and Principe to northeastern Brazil." Students might phrase a correlated question, "Do fewer Portuguese slave ships land in those islands ports and more arrive in Brazil in 1600 than in 1550?" (4) Have the students look at search options on the database and design search queries based on the questions they came up with. (5) As the student conduct these searches, they should record their findings in journals, noting not only where the search results correspond to or contradict Davis's story, but also the different types of search queries they used to investigate each claim Davis makes,

and places where they had difficulty deciding on an effective search.

METHOD CONTENT LECTURES STRENGTHENING ENTREPRENEURSHIP IN THINKING AND ACTING

Susilaningsih
State University of Malang
E-mail: susilaningsih.fip@um.ac.id

ABSTRACT

Department of Educational Technology (TEP) Faculty of Education (FIP) University of Malang (UM) need to adopt a charge of entrepreneurial learning in the eyes of college. The development of these learning needs to be done to improve the ability of students in entrepreneurship by strengthening belived themselves in thought and action by using. teaching model developed for the course Development of Audio Radio learning is based on the idea Ausubel about the lecture material, cognitive structure, receptions active learning, and advance organizer who skewering and reliable.

Keywords: lectures, entrepreneurship, thinking, action.

The curriculum structure Technology Department of Education (TEP) Faculty of Education (FIP) University of Malang (UM) need to adopt a charge of entrepreneurial learning in matakuliah. This is because the number of matakuliah mandatory 1 3 6 credits and matakuliah selection of 12 credits. Matakuliah required 136 credits consist of six components , namely MPK, MKF, MKK, MKB, MBB (including MPKKN), and MPB and matakuliah 12 credits selection of components is MKB 2. With the number of these entrepreneurial matakuliah may not be included in the curriculum of lectures UM Department of TEP FIP. the total number of 148 credits a course load that fall bazaar and close to maximum for the size of S-1. So for now, it takes courage to integrate entrepreneurship into existing matakuliah.

Ability student of TEP FIP UM in 2010 to 2011 in the field of entrepreneurship is still relatively minimal. In 2010 indicators taken from the " List Title Proposal for participants Entrepreneurship Program, State University of Malang Year 2010 Declared Eligible Funded", as in annex 4, students TEP only 3% to 1 proposal. In the knowledge 2011 indicator is taken from " The List of Participants Student Entrepreneurial Program (PMW), State University of Malang Year 2011 Type Proposal Individual" in Annex 5 decreased to 2% even though the quantity is funded increases to 3 proposal. So the entrepreneurial abilities of students TEP FIP UM cannot be the benchmark of student competency.

Breakthrough implantation of entrepreneurship needs to be done on matakuliah-matakuliah types Matakuliah Skills Working or MKB both MKB 1 (matakuliah required) and MKB 2 (matakuliah selection). Matakuliah Management Information System is matakuliah MKB 1 that are providing knowledge and skills to students, so expect by taking the matakuliah TEP student of Faculty of Education, University of Malang have knowledge and skills in designing and creating and managing Information Systems as a learning medium.

Entrepreneurial aspects put forward by Arismunandar (2011) revealed that the essence of career development in the field of entrepreneurship should begin with the provision of entrepreneurial skills gained from the educational process. In the world of work or effort, partly daripada young workers, especially those who enter the workforce without the skills and interpret the work solely as a 'task' and serves as a lifeline, not as a career can be explored and developed. Instead, they were spirited entrepreneur, has the ability to design their own development of their careers, by doing an internship in order to master certain skills, experimenting, and doing the learning independently. the foundation describes an idea of thinking need their self-confidence of students majoring in TEP FIP UM to start thinking and acting entrepreneurial in every matakuliah. To matakuliah has meaning for students TEP FIP UM.

Matakuliah Development Audio Learning is matakuliah involving elements of cognitive, affective and psychomotor student. To support the success matakuliah Development Audio Learning students must be provided with much experience as possible, so technically matakuliah have a little time in learning theoretically. The technical aspects of information systems are a very important element in this matakuliah, so that students are able to experiment, explore information. Production information system is related elements such as meda information transfer information system on media presentation.

Judging from kewairausahaan element, success matakuliah Development Audio Learning in general depends kepiwaiaian aspects of the

individual (in this case the students) to influence the users (in the lecture is represented by fellow students and professors). This reinforces the need to strengthen entrepreneurship in students. Proximity Audio Development Learning courses with detailed kewirausahaann is the desire for someone who wants to display to the user about something and trying to convince users of the information. In Philosophical, information obtained by manipulating the data has no value and is clearly wrong .. So specifically Approaches intensive learning model to students who take on this matakuliah be able to manage information and capable of presenting properly and systematically.

During this approach matakuliah lecturers and students do collectively. That is the cognitive and psychomotor students are only touched upon in class meetings and lecturers during understand the learner as a homogeneous society with all the similarities good behavior, willingness, in principle, abilities and other personal aspects.

Application of Advance Organizer in matakuliah Development Audio Learning is actually to accommodate the ideas of students, who depat associated with characteristics Management of objects of information. In the scenario learning later, lecturers not only perform the delivery of material, but also to manage learning resources, student and classes that use face-to-face on-line and face-to-face off-line. This is because the model advance Organizer related to the potential of the student, then in theory, this model can affect performance by helping to develop the ability of students in terms of thinking chime with action.

In general, according to Joyce , if the lecturer presents the material to the students, only a few (most of) these materials will be studied. If this material is presented with the management structure were studied may be more. If lecturers using processes that help students through the development of certain ways of thinking, then all potentials including entrepreneurship charge will be easily displayed. Therefore, if a lecturer avoid using the models of teaching that seeks to provide a certain intellectual structure and use of certain thought processes and bertindak they can help reduce the chance of students to use the potential ability. In general, the activity of speaking (speaking), the development of one of the intellectual structure either through a presentation method or an inductive method can increase the likelihood that students will learn the structures and thought processes associated

with them, and that they will keep the material stronger. Most felt their effects on students will have the confidence that can be seen in the problem-solving behavior when students bring these structures to cope with the problems that they have not met before.

STAGE DEVELOPMENT METHOD OF LEARNING

As noted above, this study wanted aims to improve students' ability in entrepreneurship by strengthening belived themselves in thought and action based learning model with Advance Organizer then the study design was carried out through the following stages:

Stage One

The first stage consists of three activities: clarify the objectives of the lecture, presenting advance organizer, and encourage awareness of relevant knowledge.

Clarifying the purpose of the lecture is one way to get students' attention and direct them to the learning goals, both vital to facilitate meaningful learning. (Clarifying the purpose of the purpose is also important for lecturers in planning a lecture.)

Stage Two

Second, if the organizer was expository or comparative, the essential features of a concept or design should be shown and explained carefully. For this reason, lecturers and students should explore organizer such as learning tasks. That means, should reap the essential features, explain it, and provide examples. Presentation of an organizer does not have to be too long, but it must be lived (learners should be aware of it), clearly understood, and constantly dealing with material that is being implemented. it also means that learners should already be familiar with language or ideas in organizer earlier. important also illustrates organizer in the context of multiple and repeated several times, in particular relating to the new terminology or specialized language. in the end, it is important to encourage awareness of the knowledge and experience of the students

previously that may be relevant to the task of learning and organizer of the ,

After the presentation organizer in the first stage, the learning material presented in the second phase in the form of lectures, discussions, films, experimentation, or reading. During the presentation, the processing of learning material needs to be made clear to the students so that they have the whole sensory cues (sense of direction) and can see the logical sequence of the material, and how the treatment was related to advance organizer.

Stage Three

Interest in the third step is to put out new learning materials into the cognitive structure of students that already exists - namely, strengthening the student cognitive processing. In the current natural teaching, some of these procedures could be included in the second phase; however, like to emphasize that the work on the back of new material is a separate teaching assignments, .with the activities and

skills. Ausubel identified four activities: (1) develop integrative atonement, (2) develop active learning receptions, (3) raises a critical approach to the eye lectures, and (4) clarify.

RESULTS METHOD IN ADVANCE ORGANIZER LECTURES

Teaching model developed for the course Development of Audio Learning is based on the idea Ausubel about the lecture material, cognitive structure, learning reception is active, and the advance organizer who skewering and reliable. Models advance organizer has three stages of activity. A) The first stage is a presentation advance organizer, b) the second stage is the presentation of the learning task or learning materials, and c) the third stage is the strengthening of cognitive processing. The last stage is to examine the relationship of learning materials with ideas that exist to produce an active learning process. Summary of the structure of the teaching model of advance organizer can be seen in table 1.

Table 1. Structure Learning Model of *Advance Organizer*

Stage One: Presentation Advance Organizer	Stage Two: Presentation Tasks or Material
– Clarify objectives lecture – Presenting organizer – Identifying characteristics conclusive – Giving an examples – Presenting contexts – Repeat. – Encourage awareness of the knowledge and experience of students	– Presenting material – Maintaining attention. – Clarify processing becomes. – Clarify the rules of the material learning that makes sense
Third Phase Strengthening Cognitive Processing	
– Using the principles of integrative reconciliation. – Advocated active learning receptions. – Generating a critical approach in the eyes of college. – Clarify.	

Activities designed to improve the clarity and consistency of learning materials so that your ideas are lost not too much just because it caused the obscurity of each other, students should dissect these materials when they receive it by connecting learning materials barn with personal experience, cognitive structure, and a critical stance on knowledge.

There are several ways to facilitate the new material with the cognitive structure of students. Lecturers can (1) remind students about ideas (the big picture), (2) ask for a summary of the important properties of the material to new learning, (3) repeat the definitions right, (4) ask for differences among the aspects of material, and (5) asked the students to describe how learning materials to

support the concept and design that is used as an organizer.

Active learning can be enhanced by (1) asking students to describe how matter barn in touch with the organizer, (2) ask students to make additional examples of the concept or design of learning materials, (3) ask students to explain verbally the essence of the material, using terminology and their own frame of reference, and (4) require students to test material from another point of view.

Critical approach to knowledge can be trained to ask students to identify assumptions or conclusions that may be made in teaching materials, expensive or challenging the assumptions and conclusions of this, and reconcile the contradictions both of them.

It is not possible or not interesting use all these techniques in a single lecture. Constraints

such as time, topics, and relevance to the situation of certain learning will guide the use of this technique. However, it is also important to remember the four objectives of this stage and techniques Special for expository teaching effective. Ideally, the initial implementation of the third stage can be discussed by faculty and students. First of all, however, teachers should respond to the needs of students for clarification several topic areas and for the integration of new materials with existing knowledge.

Basically, Ausubel provide a method to improve not only the presentation, but also the ability of students to learn from the presentation. The more often train students to actively seek treatment ideas, reconcile information with the idea, and make organizer alone (engage in the activity of inductive over reading or watch) the greater the potential students in finding the benefits of such presentation.

In this model, the lecturer must maintain control on the intellectual structure, as it is important to connect the learning materials to the organizer and help students distinguish the new material with the materials that have been studied previously. In the third stage, however, the learning situation should ideally be more interactive, the students -mahasiswa need to be stimulated to ask questions and provide feedback. Obtaining materials that succeed will depend on the wishes of learners in integrating it with prior knowledge, through their critical abilities, presentation lecturer, and processing of such information.

Tasks Lecturers

The duties of lecturers to students is directed with the aim of clarifying the meaning of the new learning material, distinguishing the meaning of and reconcile with existing knowledge, make it relevant to the students personally, and help them improve their critical approach to knowledge. Ideally, by the way like this, students will submit their own questions in response to the determination of the meaning of what they do.

FUNCTIONS INSTRUCTION THAT REACHED

Model advance organizer is particularly useful for preparing circuit or orientation of the curriculum and train students systematically in a key notion particular field. Step by step, concepts and designs critical explained and integrated, so that at the end of teaching, learners will gain perspective on the whole fields studied.

Results obtained with an increase in students' understanding of the factual information that is associated with and is explained by the key ideas. For example, the concept of socialization can be described repeatedly in the study of the patterns of socialization in the culture and subcultures are different. The model is thus helped broaden student knowledge about the culture.

The model can also be set up to teach the skills of learning receptions effective. Critical thinking and an overhaul of cognitive can be explained on the learner, who received the direct teaching of thinking on a regular basis and on the idea of a hierarchy of knowledge. Finally, they can apply these techniques independently the new learning material. Put another , this model can improve the effectiveness of reading and watching movies, and activities "reception" other.

Other models are also important in evaluating and applying the material presented by the advance organizer. For example, the model advance organizer, after introducing new material in ways deductive presentational, can proceed with the activities of the discovery of the concept of inductive to strengthen the material or informal acquisition can evaluate students on the material.

STRENGTHENING OF ENTREPRENEUR-SHIP IN THE COURSE

Entrepreneurship education in higher education need to establish rationale that fit the criteria to be achieved. University as a facilitator to foster an entrepreneurial culture. The University has a strong focus on entrepreneurial culture and disseminate it to all students both on business programs, as well as nonbusiness. Therefore students of disciplines such as engineering, art and design, education, science, tourism, and others also have the opportunity to entrepreneurship in accordance with their respective expertise. University as a mediator for the mastery of entrepreneurial skills. Students entrepreneurs who pursue careers through entrepreneurial activities equipped with a set of skills that can help them identify the right business idea as well as providing them with a practical approach to entrepreneurship, for example in the form of cooperative student.

Implementation of Entrepreneurial Program for students. Universities can organize courses or training entrepreneurship as a complement to the lecture programs common to all students, or organizing entrepreneurship program integrated which are specifically designed for a group of students who have a high interest in entrepreneurship. In some universities the program has conducted through the Student entrepreneurial Program (PMW) .Universitas as a locomotive of regional business development. a strong focus on entrepreneurship will encourage universities to

network with various stakeholders who focus on entrepreneurship. Universities can also facilitate the design of regional policies and the development of infrastructure to support the development of entrepreneurship in society.

CONCLUSION

Strengthening belived themselves in thought and action can be done by using model Advance Organizer. The learning activities result in several things, among others: 1) Integrating entrepreneurship into matakuliah Audio Development Learning through models of Advance Organizer. 2) Implement a model Advance Organizer to increase student confidence in thinking and acting in entrepreneurship in the corridor matakuliah Audio Learning Development. 3) This research was conducted in order to empower potential and resources existing learning at the Department of TEP FIP State University of Malang, including servers, workstations and LAN systemusing the system SAPPROL

For lecturers can be used to draw upload learning to TEP FIP UM Department Website for use by students. In this way the interaction between professors and students not only in the classroom as a lecturer easily present the learning material to students participating in his courses. In addition, teachers can access teaching materials from sites other lecturers, so it can easily do collaborations with other faculty in the development of teaching materials.

Students no longer need to wait a lecturer in the following courses were cultivated because all materials have been provided (be uploaded) on the computer (Web-site lecturer). Learning this way allows students to easily manipulate their own teaching materials that want presented by lecturers.

Department of Educational Technology (TEP) Faculty of Education, University of Malang (UM) has committed to continue to develop its services. This commitment is demonstrated through the provision of LAN and installation of Web-site laboratory to be used as an access to all information for both faculty and students. Through empowerment all facilities available at the laboratory in turn will support the department in the execution of its programs, including the provision of learning through e-learning. In addition, the learning process through e-learning this will facilitate the Department in controlling the activity academic, lecturing and presenting related subjects.

LEARNING MODEL DEVELOPMENT IN MULTICULTURAL EDUCATION THROUGH SCIENTIFIC APPROACH BASED ON VALUE INQUIRY

Sutansi; Widayati; I Made Seken
State University of Malang, Indonesia
Email : sutansipgsd@gmail.com

ABSTRACT

Long term objective of this research is to gather a learning model that could improving multicultural education competency through scientific approach for elementary school student. The special purpose is to find a right learning model in integrated curriculum that could increasing attitude competency of student with 5 step activity : (a) observing, (b) questioning (c) associating (d) experimenting (e) communicating. Development model from Borg and Gall like : (1) introduction study, (2) model development (3) model of test. Discussion about the research (1) development of learning model through 5 scientific approach activity (2) multicultural learning model development with KI/KD function development (3) lesson plan development (4) lesson step development process (5) teacher perception about learning model development of multicultural education. Result of the research (1) with scientific approach that bring student to doing, feeling, proving, communicating about topic not only just memorizing. (2) learning activity of student are proving an improvement of problem solving ability in group. (3) student creativity show improvement of their learning style not only to memorize and document the topic, but also they can observing, identifying, analyzing, comparing, and proving (4) build enjoyable team work. It result have been recorded in CD of learning that consist learning strategy in integrated curriculum through scientific approach based on value inquiry.

Key word: multicultural education, integrated curriculum, scientific approach

The applicataion of curriculum 2013 that focus on scientific approach having significant transformation. All the subject of matter has being integrated with the other subject of matter. It doesnot have standard of quality (*standar kompetensi)* again anymore but the learning process is accentuated to the point of competency *(kompetensi inti)* and the base of competency *(kompetensi dasar)*. There are three main design of curriculum 2013 development: attitude, knowledge development, and skill development (Sani, 2014)

The principle of arrangement it curriculum is based on chapter 36 national law number 22 in 2003 that declared as below: The arrangement of curriculum have to consider with the improvement of religious value, an improvement of right values. Increasing of potency and student interest, diversity in local heritage and it environment, demand of developing the nation program among region, demand of work field, developing of knowledge and technology, art, religion, global development issue and national law and national values (Ridwan, 2014).

Objective of learning process is adapted with national curriculum purpose that being listed in chapter 3 of national law number 20 in 2003, that declare as below: The developing of student potency to be religious person, having good moral, healthy, smart, capability, creative,

be autonomous and be democratic and responsible civilian.(kemendikbud, 2013)

The main problem in this research is to develop integrated curriculum learning process through scientific approach with making a lesson plan and run it in elementary school. To evaluate the program it need a right validation instrument and then it result is use for describing about the effect from learning activity to student.

The research according to information from department of education in Blitar region, it been chosen that grade IV in elementary school as the subject of it research. Because it grade in 2013 – 2015 education period has used curriculum 2013 for 4 semester and based on it the teachers are expected to be ready when applied in this curriculum. Especially implementing of integrated curriculum through scientific approach based on value inquiry.

METHOD

Descriptive qualitative is using as strategic to design this research that the model of this research development is using Borg And Gall model (modification from Sukmadinata) there are four step in this research: (1) introduction preview, (2) field orientation, (3) model development, (4) model of test. (Sukmadinata, 2009).

First chapter is introduction preview. It step is the back ground of this research because in this step there are three step to do: (1) first, literature review, (2) second field orientation, (3) third making draft

model for the research. And then developing learning model test with limited subject observation for 4 school and continue to 15 schools as whole subject that use national curriculum.

The subject of it research is the teacher of elementary school that being the pioneer of curriculum 2013 implementation in Blitar, east java regions. Sampling activity is randomly technique for choosing the elementary school that have been used the curriculum 2013 for 3 semester. And have been chose 15 school as subject in Blitar regency in east java province.

Information about integrated curriculum learning model through scientific approach based on value inquiry are gathering by: (1) observation, (2) questioner (3) documentation.

Instrument for gathering information are: teacher performance test, teacher questioner, interview guide. Information were gathered will be analyzing by descriptive and percentage.

RESULT AND DISCUSSION
Result

Limited subject test for 4 school below SD Tangkil 1, SD Nglegok, SD Kalipang 1 and SD Resapombo. Questioner that used are discussed about: (1) development of integrated curriculum learning model through scientific approach based on value inquiry (2) formulated lesson plan development (3) learning step development for integrated curriculum based on value inquiry in elementary school student. (4) teacher perception about integrated curriculum learning model based on value inquiry.

From information analyzing we can conclude that: *first:* (a) integrated curriculum learning activity through scientific approach based on value inquiry implementation, 6 respondent has a very good category (40%); 9 respondent has a good category (60%); (b) implementation of an integrated curriculum learning activity through scientific approach based on value inquiry, 3 respondent has very good category (50%), 12 respondent has good category (60%); (c) integrated curriculum learning activity through scientific approach in every theme / sub theme activity, 10 respondent has very good category (66,60%), 5 respondent has good category (33,33%).

Second: (a) integrated curriculum learning activity through observation activity, 7 respondent has a very good category (46,66%) 8 respondent has a good category (53,33%); (b) implementation of an integrated curriculum learning activity through scientific approach based on questioned activity, 3 respondent has very good category (20%), 12 respondent has good category (80%); (c) integrated curriculum

learning activity through scientific approach based on association activity. 3 respondent has very good category (20%), 12 respondent has good category (80%), 1 respondent have enough category (7,14%); (d). networking activity, 3 respondent has very good category (20%), 12 respondent has a good category (80%).

Third: (a) formalizing *kompetensi dasar* (KD) be indicator of qualification (KI1,KI2,KI3,KI4), 6 respondent has very good category (40%), 9 respondent has good category (60%) (b) developing lesson source activity, 6 respondent has very good category (40%), 9 respondent has a good category (60%), (c) lesson strategic development, 4 respondent has very good category (26,66%), 10 respondent has good category (66,66%); 1 respondent have enough category (6,66%) (d) lesson scenario planning activity, 5 respondent has very good category (33,33%),10 respondent has good category(66,66%); (e) class management, 6 respondent has very good category (40%), 9 respondent has good category (60%); (f) evaluation procedure planning, 5 respondent has very good category, (33,33%), 9 respondent has good category (66,66%), 1 respondent have enough category (6,66%); (g) presenting lesson plan document, 5 respondent has very good category (33,33%), 9 respondent has good category (66,66%) 1 respondent have enough category (6,66%).

Fourth: about integrated curriculum learning process based on value inquiry through scientific approach lesson step observation we can conclude as below: (a) directing, guiding, penetrating, understanding problem to developing student attitude and deducing activity in learning process, 5 respondent has good category (33,33%), 10 respondent has very good category (66,66%), (b) motivating, and rewarding student activity to find a right value about the problem in learning process, 3 respondent has very good category (20%), 12 respondent has good category (80%), (c) motivating student to identify about right value from student and teacher learning activity, 4 respondent has very good category (26,66%), 10 respondent has good category (66,66%), 1 respondent have enough category (6,66%) (d) discovering activity about conflict value by student, 3 respondent has very good category(20%), 12 respondent has good category. (80%), 1 respondent have enough category (7,14%); (e) motivating and rewarding the student in hypothesis making 2 respondent has very good category (13,33%) 11 respondent has good category (73,33%), 1 respondent has enough category (24,42%); (f) Penetrate the student to evaluate their hypothesis, 2 respondent has very good category (13,33%), 12 respondent has good category (80%), 1 respondent have enough category (6,66%), (g) Help student to find a right value from the problem 3 respondent has very good category

(20%), 11 respondent has good category (73,33%), 1 respondent have enough category (6,66%) (h) Directing the student to find relevant reason about it value, 2 respondent has very good category (13,33%), 12 respondent has good condition (80%) and 1 respondent has less category (6,66%).

Fifth: according to data analyzing about teacher perception about integrated curriculum learning process through scientific approach based on value inquiry process. The result show as: (a) Integrated curriculum learning process based on value inquiry development problem: model development step; 7 respondent has very good category (50%), 5 respondent has good category (35,71%), 2 respondent has less category (14,28%) (b) Integrated curriculum implementation using learning step and learning model 1 respondent have very good category (6,66%), 11 respondent has a good category (73,33%), 2 respondent has enough category (13,33%), 1 respondent have less category (6,66%); (c) teacher understand about value inquiry 3 respondent has very good category (20%), 11 respondent has good category (73,33%) 1 respondent have enough category (6,66%); (d) demand of value inquiry model development 5 respondent have very good category (33,33%), 9 respondent has good category (60%), 1 respondent have enough category (6,66%); (e) demand of inquiry model socialization 4 respondent has very good category (26,66%), 11 respondent has good category (73,33%).

RESULT AND DISCUSSION
An integrated curriculum learning activity through scientific approach development

Study based on information in the research reviewed from function implementation the research in elementary school show the result as below: the highest percentage of very good category (60%) and followed by good category (40%), from it result we can conclude that teacher capability to developing integrated curriculum learning model trough scientific approach based on value inquiry in curriculum 2013 is in good category because the conditions are very good category 85%- 100% (Suparno, 2009).

Integrated curriculum learning process through scientific approach purpose in model development implementation has the highest percentage of good category (80%), next level is in very good category (20%), from it result we can conclude that teacher capability to developing integrated curriculum learning model trough scientific approach based on value inquiry in curriculum 2013 is in good category

because the conditions are very good category 85% - 100% (Suparno, 2009).

Scientific approach development in each theme / sub theme in each lesson has the highest percentage in very good category (66,66%), follow by good category (33,33%). from it result we can conclude that teacher capability to developing integrated curriculum learning model trough scientific approach based on value inquiry in curriculum 2013 is in good category because the conditions are very good category 85%- 100% (Suparno, 2009)

According to the result of the research about "multicultural education development through scientific approach based on value inquiry it show successfully from: (1) observing (2) questioning (3) experimenting (4) associating (5) networking. All indicator above are showing 4 scale (very good) and 3 scale (good).

Multicultural Education Development Through Scientific Approach Based On Value Inquiry

Observation activity in Scientific approach learning process implementation are having the highest in very good category (46,66%), and good category (53,33%). From the information above we can conclude that teacher capability to developing scientific approach in curriculum 2013 is in good category because the conditions are between good and very good category 85% - 100% (Suparno, 2009).

Questioned approach in the learning process implementations are including in good category (80%) and very good category (20%). From the information above we can conclude that teacher capability to developing questioning approach in curriculum 2013 is in good category because the conditions are between good and very good category 85% - 100% (Suparno, 2009).

Experiment approach in the learning process implementations are the highest percentage in good category (66,66%) and very good category (26,66%) and enough category (6,66%). From the information above we can conclude that teacher capability to developing experimenting approach in curriculum 2013 is in good category because the conditions are between good and very good category 85% - 100% (Suparno, 2009).

Associating approach implementation has the highest percentage in good category (80%), very good category (20%). From the information above we can conclude that teacher capability to developing associating approach in curriculum 2013 is in good category because the conditions are between good and very good category 85% - 100% (suparno, 2009).

Networking ability in learning process implementation has the highest percentage in good category (20%) and very good category (80%).

From the information above we can conclude that teacher capability to developing networking approach in curriculum 2013 is in good category because the conditions are between good and very good category 85%- 100% (suparno, 2009)

Lesson Plan Development and formulating

Formulating *kompetensi dasar* (KD) in learning process is in the highest percentage for very good category (60%), good category (40%); from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Developing and organizing lesson source are in the highest percentage of very good (20%), good category (80%) from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Developing learning strategy: method, model, and strategy in learning process; have the highest percentage in good category (66,66%); and very good category (26,66%) and enough category (6,66%); from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Formulating lesson step, time allocation, motivation and determining the type of learning process ; it have the highest percentage in very good category (33,33%), good category (66,66%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Class management have the highest percentage of good category (60%), very good category (40%). From it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Evaluation technique lesson procedure preparing have the highest percentage of very good category (60%), good category (40%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Percentage lesson plan document have the highest percentage of y good category (60%); very good category (40%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Learning step development in integrated curriculum through scientific approach based on value inquiry

Directing, guiding, penetrating, understanding problem to developing student attitude and deducing activity in learning process have the highest percentage of good category (66,66%) and very good category (33,33%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Motivating, and rewarding student activity to find a right value about the problem in learning process have the highest percentage of good category (80 %), very good category (20%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Discovering activity about conflict value by student have the highest percentage of good category (66,66%) and very good category (26,66%) and enough category (6,66%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Motivating and rewarding the student in hypothesise making have the highest percentage of very good category (80%), good category (20%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).;

Penetrate the student to evaluate their hypothesis have the highest percentage of good category (66,66%) very good category (13,33%) and enough category (6,66%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Help student to find a right value from the problem have the highest percentage of very good category (80%), good category (20%), from it result we can conclude that teacher capability to formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Directing the student to find relevant reason about it value have the highest percentage of good category (80%) very good category (20%), from it result we can conclude that teacher capability to

formulated lesson plan in curriculum 2013, are in good and very good percentage category 85% - 100% (Suparno, 2009).

Teacher perception about integrated curriculum learning model through scientific approach based on value inquiry

Integrated curriculum learning process based on value inquiry development problem: model development step have the highest percentage of good category (66,66%) and very good category (27,68%) and enough category (6,66%), from it result we can conclude that teacher ability to understand about inquiry model is in good category it cause the percentage between 85 % – 100 % (Suparno, 2009)

Integrated curriculum implementation using model and development step have the highest percentage of good category (66,66%) and enough category (13,33%), less category (6,66%); from it result we can conclude that teacher ability to understand about inquiry model is in enough category it cause the percentage between 85 % – 100 % (Suparno, 2009).

Integrated curriculum with Value inquiry model teacher perception have the highest percentage of good category (73,33%) and very good category (20%), and enough category (6,66%). from it result we can conclude that teacher ability to understand about inquiry model is in enough category it cause the percentage between 85 % – 100 % (Suparno, 2009).

Integrated curriculum learning process based on value inquiry development have the highest percentage of good category (60%), very good category (33,33%) and enough category (6,66%); from it result we can conclude that teacher ability to understand about inquiry model is in very good category it cause the percentage between 71 % – 76 % (Suparno, 2009).

Integrated curriculum learning process development using guidance book have the highest percentage of good category (73,33%) and very good category (14,28 %), from it result we can conclude that teacher ability to understand about inquiry model is in good category it cause the percentage between 85 % – 100 % (Suparno, 2009)

CONCLUSION AND RECOMENDATION
Conclusion

Based on the problem, aim, and result of the research and the discussion result it can conclude that the observation of second year of research had few result as below: lesson plan of

integrated curriculum learning process based on value inquiry through scientific approach which have high validation to reach the objective of the learning activity in the class.

All of the result which have been not detailed above will be recorded in CD of learning and teacher guidance book that contributed to the real implementation of integrated curriculum learning process based on value inquiry through scientific approach to increasing a quality of integrated curriculum learning process itself.

This development research also produce about the model of learning strategic (observing, questioning, experimenting, associating, networking) and value inquiry oriented model like planning, retrieving, processing, creating, sharing, evaluating.

The model of learning above has been tested in integrated curriculum learning process development according to theme/sub theme in elementary school especially in grade IV. And all of it produce validation result on CD of learning

Recommendation

The result of the research show that all the model of learning strategy in elementary school developing program are valid as theoretical aspect and can put into practice in learning process and effectively reached to aim of study. So it advised to the teacher in elementary school to have ability for implementing strategic model on this research in the teaching and learning process at school. Especially for integrated curriculum learning process.

ABSTRACT

This study aims to determine the level of employment of teachers with the ability to work motivation, organizational culture, job satisfaction and self efficacy SD Islamic Al Azhar in Jabodetabek. Research using quantitative descriptive method. Analysis of data using path analysis. Data collection through questionnaires by the teacher. Sources of data obtained through respondent data, photos and scores the results of the questionnaire. The results of this study indicate, commitment of teachers affected by job motivation, organizational culture, job satisfaction and self effacy.

Keywords: commitment, teacher, professionalism.

The reality of education still remains problematic. It is seen from the observation UNICEF in 2008 stating that the emerging challenges in education is teacher qualifications, effective teaching methods, school management, and community involvement in education. Data from the United National Developnment Project (UNDP) in 2012 stated that the quality of Indonesian human resources was ranked 108, compared with Brunei to-30, Singapore 12, Malaysia 62, Thailand 89th and Sri Lanka 75th, these data show that the quality of education in Indonesia is still low. It is supported by the results of research conducted by Center for Data and Information Education, Research and Development, Ministry of National Education in 2011 which found that the percentage of teachers eligible under the occupation are as follows: 65.29% Senior High School teacher; Private high school teacher 64.73%; teachers SMK 55.49%; Private vocational teachers 60.99%; State school teachers 54.12%; Private school teachers 60.99%; public school teachers 26.83% and 28.94% Private primary school teachers. This finding marks the overall average teachers, ranging from elementary school teacher, junior high and high average of 52.17% was not professional and not eligible to become a teacher.

Therefore, the quality of education needs to be improved by increasing the ability of teachers in performing their duties as a teacher. The teacher's task will not run properly without considering the factors that influence the success of teachers in performing the task.

The ability of teachers to work motivation, organizational culture, job satisfaction, self effecacy has been linked with work commitments. Thus needs to be reviewed so that the interested parties, in this case the board of trustees may reconsider aspects which need to be improved so that the higher the teachers' commitment in achieving the organization's objectives in this school.

METHOD

This research uses descriptive quantitative approach, with the survey method with the approach path analysis (path analysis). This study will examine or analyze the relationship between the variables, and measure the effect of one variable to another variable. Variables studied comprised five, namely: (1) work motivation (X1), (2) Cultural Organization (X2), (3) Job Satisfaction (X3), (4) Self Eficacy (X4) and (5) Commitment to Work (X5). Data was collected using questionnaires filled out by respondents consisted of teachers. Assessment is done by using a rating scale (rating scale), to assess the Al Azhar Islamic elementary school teachers from Jabodetabek sampled in this study. Questionnaires to respondents used to obtain data regarding the ability of employee motivation, organizational culture, job satisfaction, self-efficacy and work commitments

In analyzing the data used descriptive analysis and inferential analysis. Descriptive analysis was conducted to see an overview of the data from each study variable indicated by the mean, median, mode, frequency and histogram distribution list. The inferential analysis used to test the hypothesis put on the path analysis (path Analysis), preceded by a test for normality and homogeneity of variance. After that, also calculated the effect of directly or indirectly between the independent variables on the dependent variable. Values influence coefficient can be seen from the track. In connection with that, the stages of data analysis are: 1) The descriptive statistics, 2) testing requirements analysis, and 3) testing the hypothesis.

RESULTS AND DISCUSSION

In order to define some variables descriptive statistics measured or observed in the study used a description of the research data. Some descriptive statistics presented include: the size of the concentration and size distribution data. Measures of central tendency of data, include: the average value is calculated, the mode and media. While the size of data dissemination, include: range or the range and standard deviation of the data. In addition to sharing some descriptive statistics, this section also presents data research variables in a frequency distribution table and graph groups.

The variables measured or observed in this study, divided into two groups of variables, namely: endogenous and exogenous variables. Endogenous variables are variables whose values are determined in accordance with the sistema studied theoretical model in the study. Endogenous variable in this study is a Work Commitment (X5). Furthermore, exogenous variables are variables whose values are not specified in the sistema, but outside the systems being studied. These exogenous variables determine the value of endogenous variables. Exogenous variables in this study, include: work motivation (X1), Cultural Organization (X2), job satisfaction (X3), and Self Efficacy (X4). Among the exogenous variables there are two variables, namely job satisfaction variable (X3), and Self Efficacy (X4) were categorized as intermediate variable. This is because varibael X3 and X4 in addition to determining the value of the variable X5, but is also influenced by variables X1 and X2. Exposure some descriptive statistics starting from X5 then continued on variables X1, X2, X3 and X4.

Based on the calculations and hypothesis testing paths can be interpreted major direct and indirect influence of each exogenous variables on endogenous. Interpretation of the direct and indirect effects of any exogenous variables on exogenous variables described in the following sections: 1) The direct effect of work motivation (X1) to job satisfaction (X3) is 0.006. Meanwhile, the indirect effect, ie the effect of working motivation through organizational culture is 0.006 x 0.330 = 0.002. The total effect of work motivation on job satisfaction is equal to 0.008.

Besides an effect on an individual basis, the exogenous variables, namely X1 and X2 shows the influence jointly against endogenous variables, namely job satisfaction (X3). Effect of exogenous variables on the endogenous variables simultaneously obtained from the product of the coefficient of determination on the substructure-1 with 100%, ie by 6%. As already noted, in addition to the effect by both exogenous variables, job satisfaction is also influenced by other variables. The influence of other variables on job satisfaction obtained from the quadratic coefficient times the influence of other variables in the path of the substructure-1 with 100%. The influence of other variables on job satisfaction is 99.2%. 2) The direct effect of work motivation (X1) to self-efficacy (X4) is equal to 0.232. Meanwhile, the indirect effect, ie the effect of working motivation through organizational culture is equal to 0.232 x 0.525 = 0.122. Total influence motivation to work toward self-efficacy is equal to 0.787. Besides an effect on an individual basis, the exogenous variables, namely X1 and X2 shows the influence jointly against endogenous variable, ie self efficacy (X4). Effect of exogenous variables on the endogenous variables simultaneously obtained from the product of the coefficient of determination on the substructure-2 by 100%, amounting to 78.7%.

As already noted, in addition to the effect by both exogenous variables, self-efficacy is also influenced by other variables. The influence of other variables on job satisfaction obtained from the quadratic coefficient times the influence of other variables in the path of the substructure-2 with a 100%. The influence of other variables on job satisfaction is 21.3%. 3) The direct effect of work motivation (X1) to work commitments (X5) is equal to 0.167. Meanwhile, the indirect effect, ie the effect of working motivation through organizational culture is equal to 0.063, with job satisfaction (X3) is approximately 0,048, and through self-efficacy is equal to 0.095. The total effect of work motivation on commitments amounted to 0.0006. The direct effect of cultural organization with (X1) to work commitments (X5) is equal to 0.379. Meanwhile, the indirect effect, ie the influence of organizational culture through work motivation is equal to 0.063 through job satisfaction (X3) is approximately 0.109, and through self-efficacy is equal to 0.216. Total influence of organizational culture on commitments amounted to 0.0005. Besides an effect on an individual basis, the exogenous variables, namely X1, X2, X3 and X4 shows the influence jointly against endogenous variable, ie work commitments (X5). Effect of exogenous variables on the endogenous variables simultaneously obtained from the product of the coefficient of determination on the substructure-3 with 100%, ie by 0.5%.

Results of a study of all the proposed hypothesis is described as follows: *First,* work Motivation significantly direct effect on job satisfaction. In the daily life of a person before motivated teachers will be preceded by a motive in him. Compliance with the requirement of motivation is not inevitable for all teachers because

if motivation met with both job satisfaction and will appear on the next turn will have an impact on his sobriety. Motivation can be financial and non-financial impact on job satisfaction (Grund and Sliwka, 2001). It is reasonable for a person to meet the needs of life will not be released to the needs of intrinsic and extrinsic.

Work motivation is needed in increasing passion and morale. Those who have a high motivation to be more excited and passionate in doing his job, so the work satisfaction will also tend to be high. Wright and Pandey (2005) states that in work that is done an employee, an emotional bond and loyalty becomes very important motivational factor, so as to bind employees to keep working in the organization. Kartika and Kaihatu (2010) in his study of 72 employees Pakuwon Food Festival states that motivation positive effect on employee job satisfaction. Brahmasari (2008), in his study of all employees of PT. Pei Hai International wiratama Indonesia in Surabaya and Jombang number of 1,737 people also found that motivation positive effect on employee job satisfaction. From this exposure, the findings of this study support previous empirical studies.

Second, Organizational Culture significantly direct effect on job satisfaction. This result coincides with findings Ida Ayu and Agus Suprayetno (2008) which prove that organizational culture positive and significant effect on employee job satisfaction, meaning that the organizational culture is a concept that can be used as a means to measure the suitability of the organization's goals, strategy and organization duties, as well as the resulting impact, because without a valid and reliable measure of the critical aspects of the culture of the organization, a statement about the impact of culture on employee satisfaction and company performance will continue based on speculation, personal observations and case studies. Kotter and Hesket in Sunarso (2009) revealed that a strong organizational culture would trigger employees to think, behave, and act in accordance with the values of the organization. Correspondence between the culture of the organization with member organizations that support it will lead to job satisfaction, thus encouraging employees to improve performance for the better, that stays on one company and a career in the long term. Therefore, a strong organizational culture is required by every organization that job satisfaction and improved employee performance that will improve overall organizational performance.

Third, Work Motivation significantly direct effect on Self Efficacy. These results are consistent with the study of Mary and Glyn (1996) which states that motivation is a significant predictor of self-efficacy.

Fourth, Work Motivation significantly affect directly the Work Commitment. These results were also confirmed by Fannida Ifani Princess (2014) that the factor of motivation is the power of motion that includes impulse, reason and volition arising within oneself that caused him to do something, for example, an employee who receives a salary, remuneration in accordance with the educational qualifications of its , it will increase its commitment.

Fifth, Organizational Culture significantly affect directly the Work Commitment. The higher the culture of the organization will have a significant impact on increasing teachers' commitment to the organization. The results of the increased commitment organsiasi ultimately lead to improvements in staff performance. The study's findings are in line with a previous study conducted by Ahmad Mubarak and Susetyo Darmanto (2015) which explains that organizational culture positive and significant impact on work commitment. The findings of this study describes efforts to increase teacher commitment can be taken to foster a culture of the organization, namely the relative strength of an individual's identification and involvement in special organization, including trust, support for the goals and values of the organization and a strong desire to use the effort earnest for the benefit of the organization and a strong will to maintain membership in the organization. It is as described by Robbins (2006), the commitment organsiasi is a situation where an employee in favor of a particular organization and purpose - its purpose and intends to maintain membership in the organization. This has an impact when a teacher is facing the conditions will be an option in the external environment, the teacher will tend mindset as the company where he worked and implicitly would show his hand on excellence - excellence company where he works. Another implication is a teacher would feel a responsibility to develop the company and do capacity development of people at subordinate. The results of this study explain that to increase employee commitment within the organization, can be reached by improving cognitive framework (cognitive framework) organization that includes the attitudes, values, norms of behavior and expectations that members of the organization donated.

Sixth, Job Satisfaction significantly affect directly the Work Commitment. These results are also consistent with studies conducted by Sukanti and Djazari (2010) which states that job satisfaction affect job commitment by 41.90%. Ronald (2007) in Sukanti also cited for building work commitments, leaders need to pay attention to the

satisfaction of the teacher, so the teacher will be more concentration on the job and not a lot of time and effort to solve the problems of dissatisfaction, but for the sake of work.

Seventh, Self Efficacy significantly affect directly the Work Commitment. The results of this study are also consistent with studies Theodore Coladarci (2010) which mentions self-efficacy is one prediktot significant increase in teachers' work commitments.

CONCLUSIONS

Based on the findings and data analysis has been done that motivation positive direct effect on job commitment, meaning that high motivation can improve work commitments; work motivation positive direct effect on job satisfaction means that high motivation can increase job satisfaction of teachers; school culture positive direct effect on job commitment, meaning a school culture that can improve work commitments; school culture positive direct effect on job satisfaction, which means a good school culture can enhance job satisfaction, work motivation positive direct effect on self-efficacy means that high motivation can improve self efficacy; school culture positive direct effect on self-efficacy, which means a good school culture can enhance self-efficacy of teachers.

The first variable and the second variable is an exogenous variable, including motivation and school culture. Job satisfaction in addition to being the first endogenous variables as well as well as exogenous third, while the fourth variable is the endogenous variables as well as exogenous fourth. While the fifth variable is an endogenous variable, ie work commitments. The findings of the research and proving the above hypothesis indicates that the motivation to work, school culture, job satisfaction and self efficacy directly influence the work commitment. From the summary of the effect of exogenous variables on endogenous variables showed that the percentage of influence motivation and school culture is greater than the percentage of influence job satisfaction and self efficacy of the commitment of teachers' work.

Job satisfaction which implies on the basis of theories as already described, namely the need for achievement, the need to relate to others, awareness of differences in income, correspondence between the output value obtained between individuals, as well as perceptions of fairness with regard to inputs and outcomes, affect direct commitment of teachers working with very significant. Besides self efficacy which implies on the basis of theories as already described, namely the experience of

success and achievement, the experience of others, verbal persuasion, physiological and psychological state, also affects the direct commitment of teachers working with very significant. In other words, work commitment of teachers in performing their duties as educators is directly affected by job satisfaction and self efficacy.

IMPLICATIONS

Based on the conclusion of the study above, then the efforts to increase the commitment to work can be done by increasing the motivation to work, school culture, job satisfaction and self efficacy, include: 1) Efforts to increase the motivation to work in order of increasing work commitments as motivation to work directly affects positively the work commitment, then the work commitment can be improved systematically and consistently through increased employee motivation by providing rewards and incentives, to develop attachments, motivated by the work itself, appreciate and recognize the accomplishments of the work, develop leadership, build inter-group cooperation, and eliminating things that are negative. 2) improving the school culture and job satisfaction in order to increase job commitment, then made fun job, pay incentive / reward honestly, provide jobs proportionally, to change the structure of the work, change the payment structure, giving a flexible work schedule, and conduct programs that support. 3) efforts to increase self-efficacy in order of increasing work commitments, then through: the successful experience that occurs repeatedly, learning through direct observation and assessment of the expertise that had also done, to find out a great effort must be expended in order to achieve expertise needed, as well as through social persuasion persuasive discussion and specific performance feedback. With regard to the teacher's ability to complete a task and assessment of psychological status you have, the teacher can improve emotional and physical abilities and reduce stress levels.

ASSESSMENT STANDARIZATION OF
SCHOOL-BASED MANAGEMENT IMPLEMENTATION RESULTS

Teguh Triwiyanto; Ahmad Nurabadi; Ahmad Yusuf Sobri

State University of Malang, Indoensia

e-mail: teguh.triwiyanto.fip@um.ac.id

ABSTRACT

This article aims to the development of initial assessment model on the school-based management implementation results. It is certainly difficulty to improve the learning quality by government and school today. If the data revealed by the government is correct, so there is almost 50% of schools in all levels that do not meet the minimum educational standard. It means that there are many schools with educational service quality that are necessary to be improved. Moreover, there are many schools under the minimum standard, with certainly less optimal educational service quality. This writing is designed to create products such as assessment standardization model. Current situation show that: (1) until now, there are still no assessment standardizations of school-based management implementation results as the references to map the learning quality at school; (2) the assessment standardizations of school-based management implementation results; and (3) the initial model development of assessment standardizations of school-based management implementation results can be conducted for trial.

Keywords: assessment standardizations, school-based management implementation results

There might be many elements that can affect on the success of educational process, but, these elements can be summarized into two components, namely the components within individual who is learning and the components coming from outside the individual. The components within individual who is learning can be grouped into two sub-components, namely psychical components and physical components. These two sub-components might be determined by heredity, some of which are determined by the environmental factors, and others might be determined by both, heredity and environmental factors. Meanwhile, the components coming from outside the individual can be grouped into some sub-components, namely natural environmental, teachers, teaching method, curriculum, program, subject methods, facility and infrastructure and social-economic conditions.

For the he components coming from outside the individual, it is necessary for the management to direct these elements into the educational purposes. The success in managing these components can improve the quality of educational process and quality of educational outcomes. The quality improvement can certainly be measured by the improvement on the educational efficiency and effectiveness. One of the forms of educational managments which is often to be used and known in Indonesia is School-Based Management.

It is stated in Article 51 of Law concerning the National Education System number 20/2003 that the "Management of early childhood education, elementary education and secondary education units is implemented based on the principle of minimum service standards through the principles of school / madrasah-based management". The school-based management is the school management concept intended to improve the quality of education in a decentralized education era. Based on the Regulation of Government Number 32 of the Year 2013 concerning the amendment on the Regulation of Government Number 19 of the Year 2005 concerning National Education Standards of Article 49 Paragraph (1), the principles of school-based management include: independence, fairness, openness, partnership, participation, efficiency, and accountability.

Results of the evaluation (Directorate of Development of Primary School Ministry of Education and Culture, *Kemdikbud*, 2012) stated that the program of school-based management in Indonesia in 2000, 2002, 2005 and 2010 showed that the guidance program on the school-based management had some positive impacts, among others are: (1) the improvement of school management to be more transparent , participatory, democratic and accountable; (2) the improvement on the quality of education; (3) decreasing on the dropout rate; (4) the improvement on the implementation of student-centered learning with active learning strategies, creative, and fun; and (5) the improvement on the participation of society into education.

The spirit of improving education in Indonesia can be seen from the vision of the Ministry of National Education 2015 - 2019 which is the implementation of national education services to form comprehensive intelligent Indonesia human

beings. It is certainly not easy to realize this vision, especially in this messy situation of national education management and education services as it is today. The management of national education should start by moving towards maturity in the areas of curriculum, facilities, finance, human resources involved (teachers and education staffs), students, and community participation, but in reality the problems keep arising. It is not just to create an improvement on the management of education, even there is a game of interests that often make educational affairs left behind. At the end, the service of national education that should be able to be enjoyed equally by each people today is still found many problems left.

Meanwhile, the mission of the Ministry of Education and Culture 2015 - 2019 also shows that indeed there are weaknesses in the management and service of national education. The contents declared are the manifestations on many weaknesses that must be improved, if this is not conducted, then the national education will be sunk. The mission itself, is increasing the availability of education services, expanding the affordability of educational services, improving the quality and relevance of education services, equality in obtaining education services, and guaranteeing to obtain the educational services.

The quality of learning that must be improved by government and schools today is indeed not easy or difficult to be realized. If the data revealed by the government is correct, so there is almost 50% of schools in all levels that do not meet the minimum educational standard. It means that there are many schools with educational service quality that are necessary to be improved. Moreover, there are many schools under the minimum standard, with certainly less optimal educational service quality. Therefore, it is necessary for an assessment standardization of school-based management implementation results for the improvement on the quality of learning.

The Assessment Standardization of School-Based Management Implementation Results

The assessment standardization of school-based management implementation results can be done through two educational management analyses. Both analyses are: efficiency and effectiveness of education. Both analysis can be used to measure the high and low rates of the school-based management, namely the curriculum and learning, learners, educators and education personnel, education finance, infrastructure, community participation, as well as cultural and school environments. The

analyses are conducted through four school management processes (planning, implementation, monitoring and evaluation of education).

The first analysis is for mapping the school-based management, namely the analysis of the educational efficiency. The educational efficiency analysis shows a close correlation between the efficiency as a concept with the education economy and the cost of education. The educational efficiency study uses the discipline of economics education as its foundation, that the education is one of the production factors having its advantages and economic values to be met. Hallak (1985: 2) stated that economically, the owners of production factors submit these factors to producers, so that the costs by the owner will be as the *consumption forgone*, meanwhile the producers obtain exact and measurable costs, consisting of wages , interest, costs and others.

As a producer of educational services, as well as other fields of activity, theoretically it results in the same concept of cost. However, education itself has specific properties which are different to other production or economic fields. Coombs and Hallak (1985: 2) stated that the application of cost concept on education reveals the existence of three forms of inherent difficulties in the nature of educational activity itself and these mainly arise from: (a) the definition of education production; (B) identification of the economic transactions related to education; and (c) the fact that education has the properties of public services.

The definition of the efficiency of education does not exactly match to the concept of efficiency in the economy or the production of goods. In the process of production of goods, efficiency can be expressed in the form of money or other monetary forms and it influences on the elements involved, namely: producers, sellers, buyers, consumers and so on. This term is a technical illustration in the production process. Nurhadi (1988: 48) stated that in the production process, efficiency is defined as a situation where a product is expected to reach a maximum level on the basis of a particular input cost or where the input cost is kept to a minimum rate as possible in order to produce a product set forth. The definition of the production of goods will be different to the production of educational process and produce educated men.

The analysis of educational efficiency describes the correlation between input and output, or between input and output. An efficient system can be seen by more output for the *input resources*. The efficiency of education means to have a correlation between the utilization of limited educational resources so that it can achieve a high optimization. Nurhadi (1988: 79) stated the efficiency of educational process will be achieved when the educational products set forth can be

achieved with minimal input costs, or the educational products can be obtained maximally by the cost (input) that has been set. This education process by Kir Haryono (1994: 24) can be viewed from two perspectives, namely: (1) as the goods consumer, it produces output and (2) as investment goods, it produces outcomes.

Just like other economic activities, the concept of educational efficiency also calculates on the opportunity cost. This opportunity cost is often called as the *income forgone*, namely the earning potential for students as long as they follow the completion of education. Therefore, the concept of educational efficiency is more complex than just profits, since the cost component consists of various kinds and nature. The cost is not only in the form of money but, itis also in the form of the opportunity cost. For example, a high school graduates who does not continue to university for certain reason, if he works, he certainly will earn and when he goes to university to continue his study, he certainly will calculate on the amount of income for approximately four years of study in the university.

It is not merely related to the educational effectiveness, the educational efficiency is also often related to the educational quality and efficiency on the educational distribution (Nurhadi, 1988: 7; Winarso, 2000: 40; and Kir Haryono, 1994: 47). Most research on the issues show that educational feedback can be measured by what is obtained by a man on the one hand and what is obtained by the country on the other hand. Personal feedback is determined from the amount of advantages obtained by a person throughout his life. These advantages are not only measured by the productivity and income but also by prosperity he achieves. The country feedback includes matters such as tax revenues. It also includes an educational system (educational institutions or schools) which can also be measured by the feedback.

As it has been mentioned earlier that the efficiency of education is included in the category of economic efficiency, while the efficiency of education can be divided into two kinds, namely the external efficiency and internal efficiency (Kaswarjono et al, 1972; Simmons, 1980; Coombs and Hallak, 1987; and Nurhadi, 1988 : 46).

The analysis steps or measurements of the efficiency of education consist of: (1) making plan ratio conducted among school-based planning input and school-based planning output; (2) making ratio of educational program realization conducted between actual input and educational program realization output; (3) calculating on the percentage of performance efficiency achievement by dividing the plan ratio and the realization ratio and then multiplied by 100; (4) providing qualitative meaning; and (5) making educational efficiency score. To determine the efficiency of education score, it is used a scale of educational efficiency performance achievement. The scale is as a position and a percentage of the analysis results which are then given score meaning.

A second analysis is for the assessment standardization of school-based management implementation results, namely the analysis of educational effectiveness. The analysis of educational effectiveness is a success indicator of an educational organization in achieving its purposes. However, the effectiveness does not consider to the costs spent achieving the educational organization purposes. How much cost spent by an institution if it reaches its purposes, then it is considered to be effective? Wijatno (2009: 279) emphasized, the things should be noted that the educational economics, educational efficiency, and educational effectiveness must be interconnected and dependent so, they all do not stand alone because they will cause not to achieve all the three (economic, efficiency, and effectiveness) overall. An institution may be only economical, but it may be not effective; or the other way around, it may be effective, but it may not be economically, so the company performance and purposes overall are not reached.

The educational effectiveness analysis uses the steps as follows: (1) enter the value / amount of the performance targets; (2) enter the value / amount of realization output; (3) calculate the achievement of performance effectiveness by dividing realization output by the performance targets and then multiplied by 100; (4) provide qualitative meaning; and (5) provide economic score. To determine the educational effectiveness, it is used a scale of educational effectiveness performance achievement. The scale is as a position and percentage of the analysis results which are then given score meaning.

The overall scores of school-based managements done through the analysis of efficiency and effectiveness are then combined which then are used to determine the quality of education. The quality of education is then as a reflection on the implementation of school-based management in each school. The reflection as intended is a standardized assessment of the implementation results in each school analyzed.

Initial Model of Standardized Assessment of School-Based Management Implementation

Results for The Educational Quality Improvement

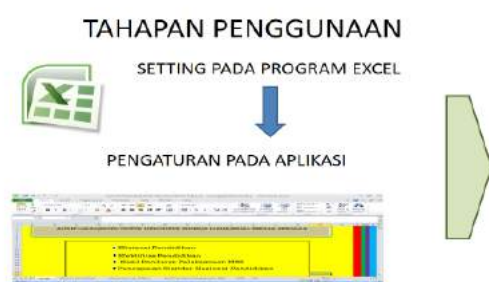
The front display of model is in one separate *sheet* related to (*hyperlink*) other *sheets*. This front page consists of four types of main menu in the educational management audit, namely (1) educational efficiency analysis; (2) educational effectiveness analysis; (3) assessment results on the school-based management implementation; (4) the achievement of school managerial performance based on educational national standard. Figure 1 shows the front page display as the stage of analysis model use.


Figure 1 Model Use Stage

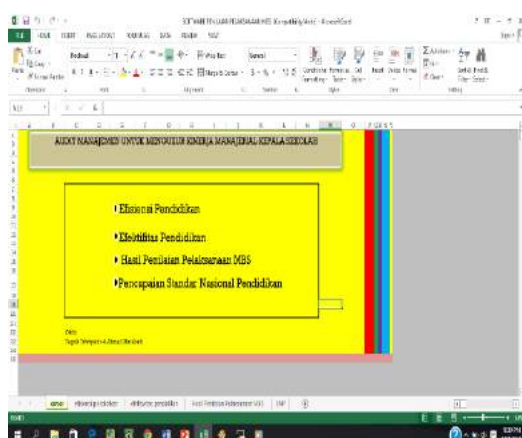
The used program is excel, this is to ease the use of the application at the time it is used. In details, the contents will be delivered from each analysis, consisting of interconnected sheet. Figure 2 shows the cover of analysis model.


Figure 2 Cover Model

There are four stages in the application use, namely the stage of data input of educational efficiency, the stage of data input of educational effectiveness analysis, the stage of assessment of school-based management implementation results, and the stage of achievement results of educational national standard. Figure 3 shows the stage of application use.

Figure 3 Stages of Application Use

The measurement on the educational efficiency in the second *sheet* follows the following steps: (1) insert the value / amount of plan input cost; (2) insert the value / amount of realization input cost; (3) input the value / amount of plan output; (4) insert the value / amount of realization output cost; (5) determine the plan ratio, namely by dividing the plan input and plan output; (6) determine the realization ratio, namely by dividing the realization input and realization output; (7) calculate the achievement of efficiency performance by dividing the ratio realization and the plan ratio and then multiplied by 100; (8) providing the qualitative meaning; and (9) giving efficiency score. The scale and score of efficiency performance achievement can also be seen in the sheet. Figure 4 as the following shows the filling of initial data for the educational efficiency analysis.

The measurement of educational effectiveness in the third sheet uses the following steps: (1) insert the value / amount of performance target; (2) insert the value / amount of realization output; (3) calculate the achievement of efficiency performance by dividing the ratio realization and performance target and then multiplies by 100; (4) providing the qualitative meaning; and (5) giving economic score. Figure 5 as the following shows the flow of data filling for the educational effectiveness analysis.

The fourth *Sheet* shows the recapitulation from the two analysis previously (the assessment of school-based management implementation results), namely (1) educational efficiency analysis; and (2) educational effectiveness analysis. Figure 6shows the data file of assessment results of school-based management implementation.

The fifth *Sheet* shows the recapitulation of the three analyses previously and the achievement of SNP, namely the 1) educational efficiency analysis; (2) educational effectiveness analysis; and (3) the comparison with the per SNP component achievement. Figure 6 shows the file data of education national standard achievement of school-based management implementation results.

CONCLUSION AND RECOMMENDATION

The elements affecting on the success of educational process can be summarized into two components, namely the components within individual who is learning and the components coming from outside the individual. It is stated in Article 51 of Law concerning the National Education System number 20/2003 that the "Management of early childhood education, elementary education and secondary education units is implemented based on the principle of minimum service standards through the principles of school / madrasah-based management". The standardized assessment of school-based management implementation results can be conducted through two education management analyses. Both analyses are: educational efficiency and effectiveness. Both analysis can be used to measure the high and low of school-based management components, namely curriculum and learning, learners, teachers and educational personnel, educational finance, facility and infrastructures, society participation and school cultura and

environment. The analyses can be conducted through four school management processes planning, implementation, monitoring and evaluation of education).

ABSTRACT

This study aims to describe the condition of literacy in elementary schools, the implementation of literacy programs, and develop a model of literacy in primary schools by empowering stakeholders, especially parents. The method used was survey as Definition of model development. The results of the survey as a basis of model development. From the analysis of the literacy skills of students still focus on understanding low level. Understanding of teachers and parents about literacy and how to play a role in the development of literacy programs is still low. Conditions literacy program is still in the initial activity of habituation. Stage of development and learning have not been realized. Literacy programs with the involvement of stakeholders especially parents also have not been realized. The conditions of the model developed literacy program with the involvement of stakeholders, especially parents.

Keywords: literacy, primary school students, parental involvement

Efforts to improve the quality of education by improving the education system. The government and the school has a very important role. In connection with improving the quality of education are factors that can not be directly controlled, deluge of information from various media. Development of information media can not be dammed a challenge for education. The challenge of the ability to analyze, evaluate, reflect the contents of the media to achievement tough generation in the information era (George, 2013).

The era of technology and information necessary to establish public awareness of the importance of the public that is not only aware of the media, but he also understands, addressing, and in favor of media impressions were correct. Spirit is what inflamed the media literacy movement. Media literacy is an effort to educate generations not to be affected by negative media content to the psychological and action or act of acceptance of media content a government policy that can be controlled is through the curriculum. The curriculum is a means to achieve a goal and requires its reliability. In the perspective of the interests of the nation, this curriculum vehicle will function and the role of both if the actors and observers have clarity of purpose and a shared vision, a road map is right, and reliability in vehicle utilization. So the curriculum includes objectives, means and facilities to support the optimization of learning (Lie, 2013). At the primary level of education insists on the implementation of the thematic approach by integrating character.

Basic literacy is the ability to listen, speak, read, write, and countrelates to the ability of analysis for accounting, perceiving information, communicate, and describes the information based on the understanding and personal conclusions. the ability to find a variety of different forms of media, such as print media, electronic media (radio media, television media), digital media (internet media), and understand the purpose of their use.Some research indicates the implementation of learning students' critical attitude towards impressions/media, and skill in selecting good impressions and not well integrated into the learning yet. Criticality student has not emerged with regard to the ability of certain impressions found to contain elements of engineering, contains elements of persuasive advertising, and television bring a particular impact on children. In addition, the ability to give an opinion about the show being watched or read the information from the media is not owned by the students. In so doing, students still take for granted what the media presented. Samples were an average age of 12-15 (end of primary education) has not been able to communicate the results of its evaluation of the information it receives. In evaluating the TV program, information on social media students are also not used to classify impressions into three kinds, namely a good impression for the kids, not good

impressions, and impressions conditional. In general, the evaluation presented by the students is about the contents of the media in general.

Another study found that the family still has not been invited to work together in improving the literacy skills of media. This is apparent from the tasks in learning to read or gather information that did not include the role of parents (Harsiati, 2013). In fact, parents should play a role in instilling pay attention on media in children. Diverse family background causes the behavior of their children also vary in media literacy skills. The role of parents is clearly visible is in providing the opportunity to access the media and accompanying extracting information on the media. The role of parents also affects the amount of time spent watching / using social media students. In the family of the students have not maximized the mediation of parents when their children watch TV / searching of information on the media. Mediation coviewing (parents come to watch with the kids) done by all not familiar among the student's family.

From the research approach to literacy found that teachers still not learning critical thinking skills against deluge of information from various mass media (Harsiati, 2013). Ability to analyze, evaluate, and reflect some of the information received from various sources has not been designed with good teachers. Learning to read instructional materials also have not focused on the ability to analyze, evaluate, and reflect the content of the media. In fact, the results showed that the time students spend in interacting with the media is quite high (Harsiati, 2006).

From the foregoing it appears that the teaching materials and learning to read in Indonesian subjects have not focused on media literacy skills. In fact, in this information age students live with exposure to many remarkable information and will have an impact on their behavior. Moreover, the stage of development of primary school students still tend to be imitate what he saw. From the results of previous studies also found that the difficulties teachers stimulate students to arrange activities analyze, question, evaluate, and reflect on the information received. In addition, not yet available teaching materials and lesson plans read membelajarkan the ability to analyze, criticize, assess and scrutinize information. Based on the results of these studies proposed research learning model

development of media literacy in primary school by optimizing the cooperation of parents and teachers. In the first year exploration of patterns of learning to read in elementary school, teaching materials, media, and RPP learning to read. In the first year also developed lesson plans and teaching materials (thematic learning implementation plan) with a focus on the subjects of reading Indonesian. However, in the first year of the new test and test experts are limited. In the next year will be developed instructional media and field tests with the development of media literacy teaching model in primary school by optimizing the cooperation of parents and teachers.

Literacy is more than reading and writing, but include thinking skills using the resources of knowledge in the form of print, visual, digital, and auditory. In the 21st century, this ability is called information literacy. Clay (2001) and Ferguson lays out that information literacy component consists of early literacy, basic literacy, library literacy, media literacy, technology literacy, and visual literacy. In the context of Indonesia, early literacy is required as the basis for derivation berliterasi next stage. Literacy components are explained as follows.

According to Beers (2009), good practices in literacy movement has emphasized the following principles. a) The development of literacy goes according to predictable developmental stages. Stage of development of children in learning to read and write overlap antartahap development. Understanding the stages of literacy development learners can help schools to choose habituation and learning strategies appropriate literacy needs of their development. b) literacy program that is both balanced Schools impartial implement literacy programs realize that each learner has different needs. Therefore, reading strategies and reading text types need to be varied and adapted to the level of education. Meaningful literacy programs can be done by using a rich text reading materials, such as works of literature for children and adolescents. c) The program is integrated with the curriculum Habituation literacy and literacy learning in schools is the responsibility of all teachers in all subjects because learning any subject in need of language, especially reading and writing. Thus, the professional development of teachers in terms of literacy needs to be given

to teachers of all subjects. d) The activities of reading and writing done anytime example, 'wrote a letter to the president' or 'reading to mother' are examples of meaningful literacy activities. e) activities to develop cultural literacy-based literacy class oral solid oral expected to bring a variety of activities is discussion on the book for learning in the classroom. These discussions also need to open up the possibility for dissent in order critical thinking skills can be sharpened. Learners need to learn to express feelings and opinions, listen to each other, and respect different views. f). Literacy activities need to develop an awareness of the diversity of the school Residents need to respect differences through literacy activities in school. Reading materials for learners need to reflect the richness of Indonesian culture so that they can be exposed to a multicultural experience.

In order for schools to be the forefront of the development of cultural literacy, Beers, et al. (2009) present some strategies for creating a positive culture of literacy in schools. a). Conditioning the physical environment friendly literacy Physical environment is the first thing seen and felt by the school community. Therefore, the physical environment needs to look friendly and conducive to learning. Schools that support the development of cultural literacy learners should be displaying the works on display around the school areas, including the corridors, the principal's office and teachers. In addition, learnerskaryakarya replaced regularly to provide opportunities for all learners. In addition, learners can access books and other reading materials at the Reading Corner in all classrooms, offices, and other areas in the school. Boardroom to display the work of students will give a positive impression about the school's commitment to the development of literate culture. b) Promoting the social and affective environment as a model of communication and social interaction and affective environment literat built through model of communication and interaction of all components of the school. It can be developed with recognition of the achievements of students throughout the year. The award can be done during the flag ceremony every week to appreciate the progress of learners in all aspects. Achievement is rewarded not only academic, but also the attitude and effort of learners. Thus, every student has the opportunity to gain an appreciation of the school. In

addition, literacy is expected to be colored all the important celebrations in the whole year. This can be realized in the form of a book festival, poster contest, storytelling, carnival story book character, and so on. School leaders should play an active role in moving literacy, among others, by building a collaborative culture teachers to teachers and education personnel. Thus, everyone can engage appropriate expertise of each. The role of parents as volunteer literacy movement will further strengthen the school's commitment in the development of literate culture. c) Promoting the school as an academic environment literat in the physical environment, social, and affective closely related to the academic environment. It can be seen from the planning and implementation of the literacy movement in school. Schools should provide ample time allocation for literacy learning. One of them by running the silent reading and the teacher read the book aloud for 15 minutes before the lesson. To support the ability of teachers and staff, they need to be given the opportunity to attend pre-service program to increase understanding of the literacy program, implementation, and its appropriateness.

METHOD

This development develop problem-solving model SD learning in the implementation of Curriculum 2013. The development method used in this case is based on the model of the RDR (research, development, research) combined or combined with R2D2 [recursive, reflective design and development (Willis, 1996; 1999) adaptation, modification and or certain transformation for the sake of the direction, goals, needs, and characteristics of the development. According to Habermas (in Kleden, 1987; Budiman, 1990), adaptation, modification, or transformation it is allowed or commonplace as an extension of the empirical-methodological models RDR and R2D2; here in the sense of RDR and R2D2 models are used to develop an instructional design modified-adapted or adapted in such a way to develop a creative entrepreneurial model-based language and art [see: experiencing expanded use]. Based on these considerations used three stages of development by models RDR and R2D2, namely (1) research for pendefinsian product (define / research) or the preliminary study, (2) design and early product development or prototype products [design and develop or

development], and (3) testing and dissemination of products [research/ disseminate].

Development starts with defining the stages of research for the products according to the model of R2D2 or early research stages according to the model of the RDR. Therefore, starting with the development of preliminary research and collection of information needed in the development of learning models to increase media literacy to optimize the role of parents of elementary school students. The results of this preliminary study will be used for materials design and develop product prototypes learning model by model of R2D2 or stages of development by models RDR. This is where the product is designed and developed to be expected. Subsequently, the resulting product was tested that includes expert-expert testing, user testing, limited field test, and test the feasibility of product development, which according to the model RDR entered the final stages of research. The results of these trials are used to improve or revise the product of the teaching model to increase media literacy to optimize the role of parents of elementary school students. The revised product is then tested the feasibility and preponderance through product feasibility test, test-skilled specialists, and test users. Based on these trials conducted in the final revision of the product in order to obtain the end product is to increase media literacy learning by optimizing the role of parents of elementary school students. The end product is distributed to a wide audience through various media as a form of strategy or dissemination phases of the product according to the model of R2D2. Model development product testing in elementary literacy activities with the involvement of parents require trial subjects were selected purposively. Subject trial product development are three (3) literacy experts, 10 Primary Schools, 30 elementary school teachers, 30 parents and 300 elementary school students from 10 elementary schools in Malang

Trial data are captured from the subject a test used to view the acceptability and feasibility of such products to increase literacy learning model to optimize the role of parents of elementary school students. Trial data is qualitative and quantitative, in the sense of exposure to verbal form the subject of the trial and informative figures depicting the acceptability and feasibility of

the learning model to increase media literacy to optimize the role of parents of elementary school students. The data collection of this trial conducted by Focus Group Discussion [FGD] or discussion is directed to the subject of the trial and questionnaires. According to trial data collection techniques, data collection instruments trial consists of two kinds, namely the FGD guide and questionnaire. Free FGD contains system-how to carry out the FGD, the process of implementation of the FGD mainly the implementation of dialogue and discussion, the development of topic of dialogue and discussion or development questions, and recording the results of FGD about learning model to increase media literacy to optimize the role of parents of primary school students in Malang. Meanwhile, the questionnaire was designed in such a way that its contents a number of statements and questions with regard to the learning model to increase media literacy to optimize the role of parents of elementary school students. Statements and questions in the questionnaire to measure the acceptability and feasibility of the model that has been developed. Data literacy skills are grouped into two categories, namely quantitative data and qualitative data. Quantitative data were analyzed using mean and mode. Qualitative data grouped into categories literacy patterns of elementary school students.

FINDING AND DISCUSSION
Ability Literacy Students

From the analysis of the report text comprehension found that there are some patterns of student understanding of the news that was heard from the media. Pola dominate the literal understanding students' understanding, especially on the question of what, who, when, and where. The question of how, and why can not be answered properly. Critical questions about the author's intention and interdepartmental relations can not be answered. Comment on the news of a general nature and has not been given argument. Ability to summarize still a copying capabilities. Exactly the same as the text is heard and has not been at the core of the news.

From the analysis of text comprehension story/narrative is found that there are some patterns of student understanding of the story is seen from the mass media. Pola dominate the literal understanding students' understanding,

especially on the question of figures, character figures, in which case, a summary of the events of the story. Critical questions can not be answered are: (1) the question of the author's intention, (2) the value of what can be taken from the story, (3) the value is contained in the dialogue, (4) an assessment of the leaders answered in general, (5) yet can benefit / value for improving oneself and (5) the appreciation and reflection questions answered in general (I'm happy, good). Comments and assessment of the general nature stories and have not given argument.

Teachers to the understanding of the literary movement

Based on the analysis of teachers' understanding of the acquired literacy matters. Teachers are still weak in terms of understanding the concept of literacy and how to implement a literacy program at the level of learning and development. Understanding how to implement at this stage of habituation in the category enough.The average score of 4 teachers' understanding of a maximum score of 10. The aspect which measured the ability of teachers covers the concept of literacy, literacy goal, ask how to improve literacy, how to engage in activities that can improve literacy before reading, how to act to support the implementation of the habituation phase, means act to support the implementation of the learning phase, how to act to support the implementation at this stage of development, how to engage in activities that can improve literacy after reading, and how to motivate children to read please.

Parents' understanding of the literary movement

The average score for understanding literacy of parents to 3.33 with a maximum score of 10. Aspects of each item being measured include the concept of literacy, literacy goal, ask how to improve literacy, how to engage in activities that can improve literacy before reading, how to act to support the implementation of the habituation phase, how to act to support the implementation of the stages of learning, how to act to support the implementation at this stage of development, how to engage in activities that can promote literacy as reading, how to motivate children to read please.

Learning Reading in Elementary Students Book

Based on the pattern of learning to read Indonesian integration with matpel / KD other subjects known that Indonesian integrate with social studies, four times and subjects PPKn one time. Based learning activities and tasks given it can be concluded that learning to read is done is learning to read aloud and reading comprehension, as students read texts with voiced and tasks given in the form of answering questions about the main points of the content of reading.

Characteristic of the text presented in the form of tests of learning to read the narration and description text.The narrative text and description text folklore and legends, as well as text consisting of one, two, or three paragraphs. Characteristics of learning to read the questions in the form of questions on the content of reading points and questions that require students to express their opinions to the text read. Learning the language is done in learning to read is a lesson in understanding vocabulary difficult vocabulary in the text.

Writing Learning in Primary Schools

Based on the pattern of learning to read Indonesian integration with matpel / KD other subjects known that Indonesian integrate with social studies, three times, subjects SBdP one time, and subjects PPKn three times. Based learning activities and tasks given it can be concluded that the teaching of writing has involved in creative writing activities, because students are encouraged to be able to express ideas, ideas, and opinions in a paper original.

Characteristics of a given task in a writing activity in the form of a task that aims to train students' skills in expressing the idea / ideas in writing, ie write stories of personal experience, write a poem, write a story about an event, write a paragraph of exposition, writing sentences and opinions based on images, and write essays.

Based on the pattern of learning writing Indonesian integration with subjects/KD other subjects known that Indonesian integrate with social studies, three times, subjects SBdP one time, and subjects PPKn three times. Based learning activities and tasks given it can be concluded that the teaching of writing has involved in creative writing activities, because students are

encouraged to be able to express ideas, ideas, and opinions in a paper original.

Characteristics of a given task in a writing activity in the form of a task that aims to train students' skills in expressing the idea / ideas in writing, ie write stories of personal experience, write a poem, write a story about an event, write a paragraph of exposition, writing sentences and opinions based on images, and write essays.

Learning Listening

There is no implementation of learning to listen to the learning process performed by the teacher indirectly. All study assesses students' ability to listen to others. This is evident in the section on the fourth grade book teachers that focuses on listening skills.

Learning Speaking

Implementation of learning to speak in the learning process performed by the teacher is presenting the results of the discussion are representatives. In addition, the task is also conducted teacher speaks to retell what they read.

Realization Indicators Habituation, Development, and Learning in Primary Schools

In this study the implementation of the literacy program includes three phases, namely the habituation phase, development, and learning.

Literacy activities in Phase Habituation

In this study the implementation of the literacy program includes three phases, namely the habituation phase, development, and learning. At this stage of habituation is found the following data. There is a 15-minute reading activity (silent reading, reading aloud), but not every day. Activity 15 minutes of reading has been running for at least one semester. Learners do not have to read a daily journal. Teachers, principals, and / or educators to be a model in the activities of 15 minutes reading to read along with you during the activity. There is a library but the reading corner in each class does not exist. , Yet there are campaign posters read in the classroom, corridors, and / or other areas in the school. There has been no material rich text displayed in each classroom. Not to design a school garden, cafeteria, and UKS be a reading center environment clean, healthy and rich text. There has been no posters on habituation to live a clean,

healthy, and beautiful. Schools do not attempt to engage the public (parents, alumni, and elements of society) to develop school literacy activities. Principals and their staffs do not have the literacy program for each year.

Literacy activities in the Development Phase

In this study the implementation of the literacy program includes three phases, namely the habituation phase, development, and learning. At this stage the following development data found. There are 13 indicators stages of literacy development. Based on observations in primary schools of 13 new indicators, there is one indicator that the observed activity 15 minutes to read aloud the Indonesian subjects but have not done every day (at the beginning, middle, or towards the end of the lesson). There has been no follow-up activities to produce a response in the form of oral and written. Learners do not have a portfolio that contains a collection of reading response journals. Teachers have not become a model in the activities of 15 minutes reading to read along with you during the activity. There are no bills written and spoken is used as an assessment of nonakademik. There has been no response journal read learners displayed in the classroom and / or school hallway. Already there is a library but the reading corner in each class, and the reading area yet. Library with a collection of non-teaching books but has not been used for a variety of literacy activities. Yet implemented rewarding the achievement of learners in literacy activities at regular intervals. There has been no campaign posters read. Environment / text rich material has not been posted in each classroom, corridors, and other areas in the school. There has been no academic activity that promotes a culture of literacy schools, for example: travel to the library or mobile library visits to schools. There is a celebration activities certain days with the theme of literacy. Yet there is a School Literacy Team formed by the principal and consists of a language teacher, other subjects teachers and education personel.

It can be concluded that indicators of literacy program implementation during the development stage has not been implemented. Category implementations included in the category has not been implemented because only average there is

only one indicator of the 13 indicators that must be met during the development stage.

Literacy activities in Phase Learning

Literacy activities in the learning phase has not been observed. Indicators of literacy activities in the learning phase includes the following activities. Not to be seen reading in place (in addition to 15 minutes before the learning) is already entrenched into the needs of the school community (visible by all citizens of the school). There has been no activity fifteen minutes of reading every day before school hours followed by other activities with non-academic bill or academic. Reading general book activities related to the textbook learner and teacher (no academic bill for learners). There has been no development of a variety of reading strategies. No tribute to the achievement of learners in berliterasi activity (based on the academic bill). There has been no response journal learners from the results of reading books and textbooks (bill academic results) displayed in the classroom and / or school hallway. Learners do not use the physical environment, social, affective, and accompanied by a variety of academic readings (print, visual, auditory, digital) literacy -in rich beyond textbooks-to enrich their knowledge in the subjects. Oral and written bill has not been used as an academic assessment. Teachers have not become a model in reading books by contributing to read books selection (general) that is read by the students. There has been no implementation of various strategies to understand texts in all subjects (for example, by using concept maps optimally, for example table TIP (Know-want- Learn), Comparative tables, Stairs Process / Chronology. Learners do not currently have a portfolio which contains a collection of journal responses read a minimum of 12 (twelve) nonpelajaran books. there are various follow-up activities to produce a response in the form of oral and written (academic bill).

It can be concluded that the implementation indicators literacy program at the learning stage has not been implemented. Category implementations included in the category have not been implemented because the average there is only one indicator of the 12 indicators that must be met at the learning stage.

CONCLUSION

Prototype development of research models in elementary literacy activities by optimizing the role of parents of primary school students, obtained the following conclusions. 1) The pattern of students' understanding of the news that was heard from the mass media is dominated by patterns literal understanding. 2) The pattern of students' understanding of the story is seen from the mass media is dominated by patterns literal understanding. 3) Understanding teachers to the literacy movement in schools is still low, especially in terms of understanding the concept of literacy and how to implement a literacy program at the level of learning and development. 4) An understanding of parents of school literacy movement is still relatively low. 5) Indicators of the implementation of literacy movements in the school at this stage of habituation, stage of development and the learning phase is still not implemented. The suggestions put forward as follows. 1) Movement literacy in schools should be a massive need to be socialized so that all parties concerned, namely from principals, teachers, parents and students can be agents of literacy. 2) The government needs to improve the ability of teachers to familiarize, to develop and implement literacy learning in order to increase the literacy skills of elementary school students.

THE EFFECT OFUSING SMARTWHEEL TOWARD THE SKILL OF ARRANGING SIMPLE SENTENCES

Tri Agustini Solihati; Asep Rizki Mukti; Rudi Permadi
Institution:…
e-mail:…

ABSTRACT

The research was carried out because of the obstacles experienced by English learners on arranging appropriate sentences for 16 kinds of tense. It is a must to be able in creating good sentences for expressing message in communication. It means the better we build the sentences, the easier and the more effective communication will be. So avoiding missunderstanding can be accomplished by perfectly comprehending the best way to make the sentences. The purpose of finishing the research is to determine the effect of using smart wheel toward the skill of arranging simple sentences. The study site was at Perjuangan University of Tasikmlaya, exactly in English Education Department. The sample was 33 students' answers to test questions. The sampling technique used was saturated sampling. This study used a quantitative approach with experimental methods, namely Pre-experimental Designs. Objective questions were created as the source of collecting data. The data collected, further processed and analyzed quantitatively to determine the effect of using smart wheel on arranging simple sentence skill. The results of the processing and analysis of data obtained the average value of 54.12 with a category of high pretest and posttest mean value of 80.39 with a very high category. Based on the t-test Paired Samples T-Test result Asymp. Sig. (2-tailed) of 0.000. In accordance with the provisions, because the probability Asymp. Sig. (2-tailed) <0.05, H0 is rejected, the response of the research hypothesis suggests that there is a significant difference on the students' skill in arranging simple sentences between the pretest and posttest. Thus it was concluded that the usage of smart wheel have an influence on increasing students' skill in arranging English simple sentences. After accomplishing this research, a new media for English teaching was born. It is called "Magic Round". Suggestions for teachers are keep assisting and guiding students on using learning media, and choosing and using the appropriate media in accordance with the material given.

Key words: Smart wheel, simple sentences

Nowadays, students do face many obstacles on mastering English. They can't gain good grade when learning it. Comprehending English should be supported by a perfect understanding on 8 skills of it. Those are divided into two different scopes. The first group consists of the mastery of grammar, vocabulary, pronunciation, and spelling. They are known as micro skills. Besides, listening, reading, writing, and speaking are macro skills. The better mastery of micro skills someone has, the more possibility he has either in reaching macro skills.

Grammar will be essential to use in producing good communication. Especially when it is in written form. English as its media to send the message should be utilized as perfectly as possible. So the information that will be sent from the sender to the receiver can be delivered completely.

A qualified education must be supported by educators who can run their rolesprofessionally either at school or environment (Heinich et.al., 2002; Ibrahim, 1997; Ibrahim et.al., 2001). In technology-based era they have to be able in educating students, managing information and environment as learning facilities. Environment means studying site, teaching method, media, and assesment system that are needed to facilitate the process of teaching and learning English. Of course the effective media will give more impacts toward students' comprehension (Daryanto: 2016).

Based on the problems above, we are interested in presenting the usage of "smart wheel" in assisting students' mastery in arranging English simple sentences for all kinds of tenses.

RESULT AND DISCUSSION
English Tenses

There are sixteen tenses in English. They have different patterns and also usages. Comprehending them will be so simple if we can just pretend four cores of them. Those are present, past, future, and past future. But there are four branches for each. Those are simple, continuous, perfect, and perfect continuous.

The first group of tenses is present. So it has four different types, namely simple present tense, present continuous tense, present perfect tense, and present perfect continuous tense. The first type expresses events or situations that exist always, usually, habitually. It means they exist now, have existed in the past, and probably will exist in the future. The example is "It snows in Alaska". The second type expresses an event began in the past, is in progress at the present time, and probably will continue. The example is "He is sleeping right now". The third type expresses an event finished sometime before now, but the exact time is not

important. The example is "I have already eaten". The last expresses an event in progress; before now, up to now, and the exact time should be found. The example is "I have been studying for two hours".

The second group of tenses is past. It has simple past tense, past continuous tense, past perfect tense, and past perfect continuous tense. The first type expresses a happened event at one particular time in the past. It began and ended in the past. The example is "It snowed yesterday". The secod type expresses an event began before and was in progress at a particular time in the past. It probably continued. The example is "He was sleeping when I arrived". The third type expresses an event was completely finished before another time in the past. The example is "I had already eaten when they arrived". The last type expresses an event in progress before another event in the past, and the particular time should be known. The example is "I had been studying for two hours before my friend came".

The third group is future. It has simple future tense, future continuous tense, future perfect tense, and future perfcet continuous tense. The first type expresses an event that will happen at one particular time in the future. The example is "It will snow tomorrow". The second type expresses an action will begin before another event and it will be in progress at a particular time in the future and probably will continue. The example is "He will be sleeping when we arrive". The third type expresses as event that will be completely finished before another time in the future. The example is "I will already have eaten when they arrive". The last type expresses an event in progress before another event in the future in particular time. The example is "I will have been studying for two hours by the time you arrive".

The last group has simple past future tense, past future continuous tense, past future perfect tense, and past future perfect continuous tense tense. The first type expresses an event that will be done in the past. The example is "She would buy a computer in the previous day". The second type expresses an event that is in progress in the past. The example is "We would be taking an examination at this time the following day. The third type expresses a wish of past event. The example is "They would have finished the math homework if they had started a lot quicker". The last type expresses an event that started in a past, is in progress, and is continued in the future. But the time itself is not known. The example is "Joanna would have been studying law at Harvard University for three years".

The explanation above will be limited on the simple sentences of each kinds of tenses, verbal sentences, active voice, and affirmative forms.

Smart wheel is a teaching aid presented to facilitate the students' mastery in comprehending English simple verbal active sentences.It is designed attractively included 92 irregular verbs and their meanings in Bahasa.The forms are simple, participle, -ing, past, and present (for third singular subject). It is round. We only need to spin it if we want to find the vocabulary meant based on the tenses we take. It has two sides; front and back side. There are five boxes on the front. The first box tells kinds of tenses in simple form. The third box informs kinds of tenses in continuous form. The forth explains perfect form. The fifth shows perfect continuous form. And the last conveys modal form. All explanations involve affirmative, negative, and interrogative. In other side, we can find the meanings of all provided irregular verbs in Bahasa and the procedure of carrying out this media.

METHOD

This research is carried out in English Education Department, Perjuangan University of Tasikmalaya. They are 36 students in the first semester. It is saturated sampling. The design is one group pretest-posttest. The approach is quantitative. The method is experiment. The form is pre-experimental design. And the instruments to measure students' mastery is objective test; true false question.

Students' comprehesion will be categorized in very high level, if the score is more than 75. 58-75 will be determined as high. 42-58 will be determined as adequate. 25-42 will be determined as poor. And less than 25 will be determined as too low (Cece Rakhmat and Solehudin: 2006).

They will be taught four times. It is taken based on the type of sentences that have been mentioned above.

RESULT AND DISCUSSION

There are 33 questions, either in pretest or posttest. In this research we will compare the result of students' comprehension before and after being taught using smart wheel. Pretest shows that there are 27 students in adequate level, 8 of them are in high level, and 1 of them is in very high level. But after using smart wheel as teaching media, the posttest result shows that 2 of them are in adequate level, 8 of them are in high level, and 26 of them are in very high level.

The other fact is the average score; 54.12 in pretest and 80.39 in posttest. We can confidently say that the improvement of their mastery is effective enough explained by the average of normal gain 0.56.

After accomplishing this research, we establish many findings. Those are inspiring us to produce new medias. Surprisingly and proudly we present the prototype version of "Magic Round". Those are separately created, completed, and enhanced in six different rounds. 3 of them will discuss active sentences. Those are used to assist the users in creating affirmative, negative, and interrogative sentences. The rest will discuss passive voice in various kinds of sentences; affirmative, negative, and interrogative. They are absolutely completed by 150 irregular verbs. Further planning is creating the software. So the verbs will be stated as many as possible, both regular and irregular verbs. It will be easier to operate, because we can install it in laptop or smartphone.

CONCLUSION

This article has presented a part of research, data analysis, and the discussion of research variable. It can be concluded as follow: a) The majority of students' mastery in arranging simple sentences are in adequate level. But after joining the learning process that using smart whell, it changes into very high level; b) There is a significant difference on students' mastery before and after utilizing smart wheel in their learning activities; c) There is an effect of using smart wheel toward the skill of arranging simple sentences.

THE RELATIONSHIP BETWEEN INTERPERSONAL INTELLIGENCE AND PARENTING PARENTS IN TENTH GRADE BEAUTY DEPARTMENT STUDENTS SMK NEGERI 2 GORONTALO

Tuti Wantu; Fitrawati Lawani

State University of Gorontalo

Email : tutiwantu67@gmail.com

ABSTRACT

The research was conducted at SMK Negeri 2 Gorontalo on interpersonal intelligence tenth grade in beauty department students, with the aim to obtain a picture of the relationship between emotional intelligence and parenting parents through correlation. From the results of the data analasis obtained a correlation of $r = 0.767$, with the determination coefficient is 0.58, which means that there is a relationship between interpersonal intelligence with parenting parents. 58% of interpersonal intelligence is influenced by parenting parents and 42% are influenced by other factors of which social environmental factors, factors intellectual development and physical growth factors. From the calculation of the significance test of correlation was obtained t_{count} amounted to 5.29, while the list of the t real level of 0.01 was obtained $t_{0,99(22-2)} = t_{0,99(20)} = 2,53$, From the calculation t_{count} greater than t_{table} means 5.29> 2.53 so that it can be concluded that a significant correlation coefficient. Based on the results of the analysis, it can be concluded that the hypothesis: "There is a relationship between interpersonal intelligence with parenting parents in tenth grade SMK Negeri 2 Gorontalo beauty department", is accepted.

Keywords: interpersonal intelligence, parenting parents

Characteristics of social life requires every individual to build a relationship with the others, so it will be established a bond of reciprocal feelings in a relationship pattern called interpersonal relationships. Interpersonal relationships in a broad sense is the interaction is done by one person to another in all circumstances and in all areas of life, giving rise to happiness and contentment on both sides

Interpersonal relationships will be established well when each individual has the interpersonal intelligence, so we can say that interpersonal intelligence is very important for every individual, especially in adolescence. Adolescence is a period of transition or the transition from the age of children into adulthood. Where teenagers should be able to improve his interpersonal intelligence to be able to socialize well against the surrounding environment.

Santrock (2007: 71) argues that in adolescence, there will be changes in the socio-emotional which include demands to achieve independence, conflicts with parents, and the desire to spend more time with his peers.

A determining factor to teach and improve interpersonal intelligence is the family. Every parents expect their children to be human intelligent and virtuous character is good, but many parents do not realize that the way they educate make children feel neglected, restricted freedom, and some have felt unloved by her parents. The feelings that many mmpengaruhi attitude, feeling, way of thinking and even their interpersonal intelligence. Application of appropriate parenting becomes very important in the formation of individual brilliance, especially interpersonal intelligence

Based on observations Courses Counseling in Schools data showed that 50% of students of class X Beauty at SMK Negeri 2 Kota Gorontalo or 11 people showed symptoms of low interpersonal intelligence. This is evident by looking at the students who are reluctant to play with friends, prefer solitude than mingle with friends, it is difficult to make friends in the mix, and does not have many friends, do not even like to cooperate with others.

Based on these cases it is necessary to test the relationship between parenting parents with interpersonal intelligence

Beauty tenth grade students of SMK Negeri 2 Kota Gorontalo.

Understanding Interpersonal Intelligence

Interpersonal intelligence (interpersonal intelligence) is one of eight multiple intelligences proposed by Gardner. According to Yusuf (2010: 235), that: "Interpersonal intelligence (interpersonal intelligence) is the ability to understand and com Based on some sense it, it was concluded that interpersonal intelligence is the ability to observe and understand the intentions, motivations and feelings of others and sensitive to facial expressions, voice and gestures of others, and he is able to respond effectively in communicating ..municate with others, by being able to distinguish the moods, temperaments, motivations and skills of others

Armstrong (in Rasiyo, 2005: 19) states that: "Interpersonal intelligence is the ability to understand and interact effectively with others". According Lwin, et al. (2008: 197), that: "Interpersonal intelligence is the ability to understand and be sensitive to the feelings, motivation, character and temperament of others". According to Armstrong (in Rasiyo, 2005: 27) that: "Students who are strong in interpersonal intelligence has leadership, sociable, and happy to cooperate". Furthermore, according Lwin, et al. (2008: 205), that: "Children who have high interpersonal intelligence will easily make friends and get acquainted with other people, love being around other people, and friendly towards others".

Characteristics of Interpersonal Relationships

The lack of interpersonal intelligence is one of the root causes of behavior is not socially acceptable. People with low interpersonal intelligence tend to be insensitive, uncaring, selfish and offended others. Therefore it is necessary to note some of the characteristics of people who have good interpersonal relationships, as stated by Suranto (2011: 28).

Know closely

This means that the parties involved in interpersonal relations to know each other intimately, because not only get to know the identity of the subject such as name, address, marital status, and employment. But more than all that, the two sides know each other beberbagai other side of life.

Mutual require

Interpersonal relationships characterized by a pattern of mutually beneficial relationships are two-way and mutual need. At least both sides feel each other requires the presence of a person friends to interact, cooperate, mutual giving and receiving.

The pattern of interpersonal relationships

The pattern of interpersonal relationships shown by their attitude of openness between the two. Interpersonal relations are also marked by personal traits understanding between the two sides. Each is open so that it can receive the personal nature of the difference.

Cooperation

Cooperation will arise if people realize that they have the same interests and at the same time have sufficient knowledge and control of yourself to meet those interests .

The characteristics of interpersonal relationships is very important to know, to be able to foster good relationships with others, and to avoid anti-social attitudes such as dishonesty, theft, murder and other forms of crime. This is because people with low interpersonal intelligence is not willing to understand the feelings of others and their actions tend to affect other people.

Influence Factors Levels Interpersonal Relations

Suranto (2011: 30), describes several factors influence the levels of interpersonal relationships including the following:

Tolerance

Tolerance requires the willingness of each party to appreciate and respect the feelings of others ..

The opportunities are balanced

That is a sense of justice of the interaction will determine interpersonal relationships. When a person feels the opportunity is balanced, equitable opportunities, it will encourage these people maintain unity.

Respect others

This attitude requires the understanding that each person's dignity.

The attitude of support, not defensive

Being supportive (sportsmanship) means the approval of others.

Openness

Open attitude is the attitude to open up, say about his situation in an open and candid. Openness in communication will eliminate misunderstanding and fraud

The joint ownership of the information

The quality of interpersonal relationships are also affected by the common ownership of the information.

Trust

Trust is a feeling that there is no danger of another person in a relationship.

Familiarity

Familiarity is the fulfillment of needs for affection, closeness and warmth.

Alignment

Alignment, or the same position for both parties. Alignment is adhesive maintaining harmonious interpersonal relationships, because in parallel to the high it will dijunjungan justice.

Control or supervision

So that interpersonal relationships are well preserved, it is necessary to control the form of caring.

Response

The response is a provision in response. Natural law says if there is action there will be a reaction .

The emotional atmosphere

Emotional atmosphere, is the harmony of the emotional atmosphere when communication is in progress, indicated by the relevant expression ..

Based on the theory of factors affecting interpersonal relations, it can be concluded that the grade or quality of interpersonal relationships have ups and downs. At any given moment is at a good level marked by harmony, togetherness, and a pleasant cooperation, but at other times may lead to a level of less well characterized by their differences and disappointments.

Interpersonal Intelligence Components

Goleman (2006: 17) points out: "Interpersonal intelligence composed by two components, namely the social awareness and social facilities". Social awareness is a skill to understand the thoughts and feelings of others. Social facility that is how we interact with others.

The components of interpersonal intelligence by Goleman (2006: 17-18) can be described as follows.

Social Awareness

Basic empathy: the ability to read non-verbal cues given by others. Such as tone of voice, facial expressions and other emotional signals.

Alignment: the ability to listen and pay attention to the full what was said by others

so that we can provide an appropriate response.

Empathic accuracy: The ability to understand the thoughts and feelings of others through non-verbal language that it provides. So it will make us more accurate in sensing and understanding the thoughts and feelings of others.

Social cognition: the ability of individuals to understand and choose what the right thing to do in different situations although there are no written rules about it. Social cognition will help people in solving social dilemmas such as how to make new friends in a new environment.

Social Facilities

Synchronization: the ability of individuals to interact with using non-verbal language.

Presentation of self: that is how people present themselves effectively when interacting with others. One aspect of self-presentation is charisma.

Influence: the ability to influence others to do something using the words carefully and is able to control themselves.

Concern: namely our concern for others. The more we care for others, the greater our willingness to sacrifice our time and energy to help these people.

Definition of Parenting

Pattern foster parent is a pattern of behavior that apply to children and are relatively consistent over time. This pattern of behavior can be perceived by the child in terms of negative and positive. (Rusdijana, 2006: 99). Furthermore, according to Ormrod (2008: 94), that: "Parenting is the common behavior patterns that are used parents in caring for their children". Another opinion was also expressed by Kohn (in Muallifah 2009: 33), that: "Parenting is the way parents interact with the child which includes providing rules, prizes, penalties, giving attention, as well as the responses of parents of each child's behavior". Correspondingly Theresia (in Muallifah 2009: 33), also stated that: "Parenting is a pattern of interaction between parent and child".

Miscellaneous Parenting Parents

Baumrind (in Santrock 2007: 47), divides parenting into three kinds, namely:

Parenting Authoritarian (authoritarian Parenting)

Authoritarian parenting style is to restrict and punish, where parents urge their

children to follow directions and respect the work and their efforts.

The characteristics of authoritarian parenting by Baumrind (in Muallifah 2009: 34), as follows 1) treating children with firmly; 2) punishing children who are considered not in accordance with the wishes of parents; 3) lack of affection; 4) less sympathetic; 5) Easy to blame all the activities of children especially when children wanted to be creative

Democratic Parenting

Democratic parenting is a pattern that encourages children to be independent but still applying the limits and controls on their actions.

Based on the theory it can be concluded that the parents were democratic to be open, flexible and provides the opportunity for children to grow and develop with the rules of rational, parents thus have a close relationship with his children, and always encouraged his son to get involved in make regulations and implementing regulations with full awareness.

The characteristics of a democratic parenting style according to Baumrind (in Muallifah 2009: 35), as follows 1) rights and obligations between the child and the parents are given a balanced manner; 2) complement each other, parents who receive and engage children in making decisions related to the interests of the family; 3) having a high level of self-control and requires children to act on the intellectual and social levels according to age and ability; 4) provide explanations and reasons for the punishment and prohibition given by parents to children; 5) always support what is done by a child without restricting all its potential and creativity, while still guiding and directing the children.

Permissive Parenting (Permissive Parenting)

Permissive parenting is a pattern where the parents are very involved with the child but little demanding or controlling them.

Based on the terms of permissive parenting proposed by Baumrind (in Santrock 2007: 47), it can be concluded that permissive parenting is the treatment of parents interacting with their children by giving leeway or freedom without control or supervision strict. Parents who permisf will give full freedom to his children to act in accordance with his wishes. Had the parents make a particular regulation, but the children do not agree or do not comply, then the permissive parents tend to be caving in and will follow the will of their children. The

characteristics of permissive parenting by Bumrind (in Muallifah 2009: 35-36), as follows: 1) parents give children freedom to the widest possible; 2) kids are not required to learn to be responsible; 3) children are given the same rights as adults, and given the widest possible freedom to organize themselves; 4) the old man was not much to regulate and control, so that children are not given the opportunity to be independent and self-regulating, and given authority to control himself.

Meanwhile, according to Dariyo (2007: 207), that the characteristics of permissive parenting, namely: (1) it has no rules in the family, (2) allow what do children, (3) parents keep my child's will, (4) the parents are not care and tend to give wide freedom to the child.

Factors Influencing Parenting Parents

According to Maccoby and Mc Loby (in Suparyanto 2010: 97), there are several factors that affect parenting parents, including:

Social Environment

Social environment with regard to the social relationship or association formed by parents and children with the surrounding environment.

Education

Education means guidance or help given deliberately against students by adults so that he becomes an adult.

Religious values espoused parents

Parents have a strategic role in mentradisikan religious rituals, so that religious values can be instilled into the mind of a child.

Personality

Personality family members are very influential on a child's personality.

METHOD

In this study, researchers used a major instrument in the form of questionnaires (questionnaire). This technique is used to obtain data about the parents' parenting students interpersonal intelligence. Data collection is done by distributing a list of statements that correspond to the problem you want disclosed.

The questionnaire response categories as follows.

Analysis Research Instruments

An instrument is said to be valid if it is able to measure accurately and recognize certain symptoms. In this study, the validity test is done by using the formula calculation Product Moment with rough numbers stated Pearson.

This instrument reliability test using Alpha (Riduwan, 2005: 115) by calculating the value of the reliability of instrument

The analysis of the data used in this study are 1) Normality Test Data. Before analyzing the data, prior testing data normality (Sudjana, 2005: 193). Normality performed parametric. 2) Test Homogeneity. 3) Simple linear correlation. 4) Product Moment Correlation and Coefficient of Determination.

FINDING AND DISCUSSION
Description of Results

Data from this study in the form of scores obtained from measuring devices in the form of a questionnaire about the relationship between interpersonal intelligence with parenting parents at SMK Negeri 2 Gorontalo

This research using the techniques of statistical processing of testing the validity and reliability, data normality test, correlation analysis and simple linear regression. This processing is to obtain a numerical value of the relationship between interpersonal intelligence with parenting parents.

From the calculation results showed that X^2_{count} = -43,06 and X^2_{table} = 5,99. Apparently the results of the calculations showed $X^2_{hirung} < X^2_{tabel}$, wherein - 43,06 < 5,99 so that it can be concluded that the data variable X normal distribution.

From the calculation results showed that X^2_{count} = -15,19 and X^2_{table} = 5,99 Apparently the results of the calculations showed that $X^2_{hitung} < X^2_{tabel}$ wherein - 15,19 < 5,99 so that it can be concluded that the data Y variables normal distribution.

Based on regression analysis regression
Y = 38,47 + 0,13X

This result implies that there is a change (decrease or increase) in the variable X, which will be followed by a change (decrease or increase) the average of 0.13 in the variable Y. This means if there is a change in the indicator parenting parents, then followed by changes in the indicators of interpersonal intelligence. The regression equation can be expressed bebentuk linear or not.

Based on testing criteria for lenearitas test set out above that the F register is obtained from F <F (1-a) (k-2, n-k). If used real level of a = 0.05, F (1-.05) (19-2, 22-19) = 8.62. It turned out that the price of F count is smaller than F register (3.04 <8.62). It can be concluded from this regression equation is not linear-shaped.

Furthermore, to test the significance predetermined test criteria that F register can be obtained from F count> F register (1-a) (1, n-2) = If used the level of significance a = 0.05, F (1-.05) (1, 22-2) = 5.20. It turned out that the price of F count is smaller than F register (1.72 <5.20). It can be concluded that the linear regression equation was not significant (mean).

Based on the simple linear correlation test results are obtained as follows:

Based on the calculations, the price of a = 48.908 and b = 0.3102, then the linear line occurs at the intersection with the Y axis to the X axis as high as 48.908. Each increment X resulting in increased value Y at 0.3102. This means that if the value of the authoritarian parenting has increased by one point, it will be followed by an increase of 0.3102 on students' interpersonal intelligence.

The following chart authoritarian parenting relationships with students interpersonal intelligence.
Graph 1. Authoritarian Parenting Relationships with Students Interpersonal Intelligence

Based on the calculations, the price of a = 55.79 and b = 0.1916, then the linear regression line occurs at the intersection with the Y axis to the X axis as high as 55.79. Each increment X resulting in increased value Y at 0.1916. This means that if the value of democratic parenting increased by one point, it will be followed by an increase of 0.1916 on students' interpersonal intelligence.

The following graph democratic parenting relationships with students interpersonal intelligence.
Graph 2. Democratic Parenting Relationships with Students Interpersonal Intelligence.

Based on the calculations, the price of a = 45.018 and b = 0.2961, then the linear regression line occurs at the intersection with the Y axis to the X axis as high as 45.018. Each increment X resulting in increased value Y at 0.2961. This means that if the value of permissive parenting increased by one point, it will be followed by an increase of 0.2961 on students' interpersonal intelligence.

The following chart permissive parenting relationships with students interpersonal intelligence.
Graph 3. Permissive Parenting Relationships with Students Interpersonal Intelligence.

Based on the calculations, the price of a = 55.79 and b = 0.1916, then the linear regression line occurs at the intersection with the Y axis to the X axis as high as 55.79. Each increment X resulting in increased value Y at 0.1916. This means that if the value of democratic parenting increased by one point, it will be followed by an increase of 0.1916 on students' interpersonal intelligence.

Hypothesis Testing

Based on the calculation of the correlation between interpersonal intelligence variable (Y) and the parents' parenting (X) coefficient r = 0,767 and r^2 = 0,58. Significant test results obtained correlation coefficient t = 5.29. In the list on the real level of 0.01 was obtained. $t_{0,99(22-2)}$ $t_{0,99(20)}$ = 2,53. it turns out t_{count} = 5,29 greater than t_{table} = 2,53 or prices t_{count} are beyond the reception area H_0, these results concluded that H_0 rejected H_1 accepted. Thus concluded that a significant correlation coefficient.
Figure 1: Curve Acceptance and Rejection of Hypotheses (X and Y)

Of the curve above shows that t_{count} = 5.29 is outside the reception area H_0. This means that there is a significant relationship between interpersonal intelligence with parenting parents. This can be evidenced by the curve above shows that t_{count} H_0 rejection is in the region, so it can be said that this hypothesis which states that "the relationship between interpersonal intelligence with parenting parents accepted".

CONCLUSION

This study shows the relationship between interpersonal intelligence with parenting parents amounted to 0.767 and the determination coefficient was 58%. This means that the 58% that occurred on student interpersonal intelligence is influenced by parenting parents, while the rest (42%) are affected by other factors including the social environmental factors, factors intellectual development, physical growth factors, and others.

Based on the analysis and hypothesis testing that has been done in this enelitian p, it can be concluded that the hypothesis that "there is a relationship between interpersonal intelligence with parenting parents on students at SMK Negeri 2 Gorontalo" unacceptable.

IMPLEMENTATION OF THE BALANCED SCORECARD AS A PERFORMANCE MEASURE STKIP PGRI TULUNGAGUNG

Tutut Suryaningsih; Novita Eka Muliawati

Institution:…
e-mail:…

ABSTRACT

Competition between universities in the age of globalization is increasingly tight. Universities vying to improve its quality so that the confidence of customers, in this case prospective students is increasing. Therefore we need a performance measurement system that can be used by management to evaluate the performance and the performance of the existing business processes in college. The results of this evaluation will be very important to plan and determine the steps and strategies to achieve the strategic vision, mission, and goals of the institution. One method that can be used as a performance measure is balanced scorecard method. In the balanced scorecard, performance is not only seen from the financial aspect, but also other aspects beyond the financial aspects of the support and influence on the financial aspects, namely the customer, internal business processes, and learning and growth. Therefore, the purpose of this study is to implement the Balanced Scorecard method for measuring the performance STKIP PGRI Tulungagung.The end result of this implementation is a company scorecard is a scorecard (performance measurement tool) consisting of strategy, performance measures, targets to be achieved, which are grouped into each section in STKIP PGRI Tulungagung viewed from four perspectives on the balanced scorecard.

***Keywords:** performance measurement, balanced scorecard, college, STKIP PGRI Tulungagung, company scorecard*

The performance assessment is essential for universities who want to stay ahead and compete in both the national and global arena. To win the competition, the performance of an organization of higher education should reflect an improvement over a period eke next period. During this frequently used is the traditional performance measures that only focus on the financial sector alone.

These financial statements are the most widely used information as a basis for measuring the performance of organizations, especially financial performance. Accounting measures used are ratios, both relating to certain items in the balance sheet or income statement, either individually or a combination of the two reports (Munawir: 1998). It is with this consideration, the ratio is a measure of organization prospects for the future (Syafarudin: 1996). So there was a financial ratios such as liquidity ratios, leverage ratios, activity ratios, profitability ratios and other ratios (Riyanto: 1997). The financial measure is believed to be the primary measurement tool.

In the further development of performance measurement that exist now (just rely on financial measures) felt had to be changed. They then develop a performance measure new that is not only based on the perspective of financial (financial perspective) but also from the perspective of the customer (customer perspective), business process internally (internal business process perspective) as well as spending and growth (learning and growth perspective) (Kaplan Norton : 1992). Fourth perspective measurements are then known as the Balanced Scorecard (BSC).

BSC as well as traditional performance measurement still use financial measures such as the company's ability to generate profits, ROI, cashflows and others. These financial measures tell only a past event that is considered sufficient for the company's industrial era which considers that the ability of long-term investments and relationships with customers not meruapakan a critical success factor. BSC using a causal approach to try to trace that profits as a result of a series of strategies and elaboration of missions applied by the company. Performance measures the company's ability generated from the acquired customer loyalty because customers are satisfied with the products and services it receives (balanced with the sacrifice of issuance or customer value). Customer satisfaction (customer satisfaction) is caused by the quality (quality) products and services are delivered in a timely manner (on time delivery) at competitive rates or cheap (low cost). Products or services produced by the internal business processes that constantly innovate and repair (continouos improvement) in accordance with the wishes of the customer (customer needs). Furthermore, a successful internal business processes supported by the ability of employees increased as the empowerment of workers in the form of education and training.

Private university as an organization or a service company is expected to provide the satisfaction of services to students. Satisfaction is spearheading management success. Then it must be measured by the BSC approach. But in addition to

customer satisfaction, university performance can also be measured by the BSC (Financial perpective, Internal Process, Learning and Growth perpective).

Performance measurement is performed with further useful perspective Balanced Scorecard to translate the vision and mission of an organization including private university. This interpretation is important in order to formulate strategic goals and objectives which will then be operationalized into a work program. With the work program, the private university can increase its performance can further achieve the ideals embodied in the vision and mission.

Efforts to implement the concept of the balanced scorecard in performance measurement private university should be made to formulate appropriate strategies to improve the performance of private university is concerned.

As described in the background, this study will implement a balanced method scorecrad as a measurement of performance STKIP PGRI Tulungagung. The formulation of the problem to be solved by doing this research are:

How to measure performance and evaluate the performance of STKIP PGRI Tulungagung on four perspectives, namely financial, customer, internal business processes, and learning and growth.

To determine the extent of the use of perspective Balanced Scorecard in translating the vision, mission in Tulungagung PGRI STKIP strategy and efforts made STKIP PGRI Tulungagung to improve performance by implementing the strategy Balanced scorecard perspective.

Comprehensive measurement system that includes aspects of financial and non-financial aspects have been designed by Robert S. Kaplan and David P. Norton called Balanced Scorcard. Balanced Scorecard to educate management and organization to look at the overall company from four perspectives: financial, customer, internal business processes, and learning and growth.

Balanced scorecard consists of two words, namely the scorecard (scorecard) and balanced (balanced). The scorecard is a card that is used to record the score results of a person's performance / personnel and plan your score to be achieved in the future. The comparison between the plan defined by the actual results achieved are used to conduct the evaluation. While the word impartial shows that the performance of such personnel impartial measured from two aspects of both financial

and non-financial, long-term and short-term, internal and external.

In the balanced scorecard, there are four different perspectives of a company's activities to be evaluated, namely: a) the financial perspective; b) customer perspective; c) internal business process perspective; d) learning and growth perspective.

METHODS

This study is a qualitative research because it uses the Balanced Scorecard as a strategic implementation tool in the effort to improve the performance STKIP PGRI Tulungagung. A qualitative approach was selected in order to obtain a result that is closer to reality. This method was chosen because researchers have access into the object of research. Researchers also as a tool (instrument) research (Moleong, 2000: 4) because it can perform in-depth interviews (in-depth interviews) with the policy makers at an object, the full observation and cast as observers.

The focus of this research is a strategic effort to improve the performance STKIP PGRI Tulungagung with the perspective of the Balanced Scorecard. Target point of this research is the improvement of financial and non financial performance that is based on the financial perspective, customer perspective, internal business perspective and learning and growth perspectives.

The reason for choosing STKIP PGRI Tulungagung as field studies because, a) STKIP PGRI Tulungagung as organizations that provide public services and can be evaluated with the four perspectives of the Balanced Scorecard, b) the opportunities this research is done very effectively as any data of doubtful validity can be as soon as possible retested in the field. This is done because there is no longer distance between researcher and research subjects (key informant).

This study requires data between other
a. For financial perspective: the organization's strategy (STKIP PGRI Tulungagung) financial data such as financial statements for the level of income
b. For the customer perspective: student profiles by region of origin, student profiles of workers and not workers, the development of the number of new students, the level of student satisfaction, the number of student development
c. For internal business perspective: the development of the number of majors or courses of study, the activity of lecturers, the number of use of the method, the use of media, the proportion of curriculum and courses, workshops curriculum implementation, the number of graduates, the number of average GPA of graduates, the addition of physical facilities

d. For learning and growth perspective: employee satisfaction index, kualias lecturers through education level, rank, teaching experience, age of faculty, administrative staff quality through the ages, levels of education, and work experience.

According Lofand and Lofland (Moleong, 2000; 112) that the primary source of data in qualitative research is that words and actions, the rest is additional data such as documents and others. Sources and data collection techniques in this research is interview and documentation.

Interviews were conducted by determining the key informant were selected by purposive sampling. Key informant who serve as a resource is led university to know the vision, mission and strategy STKIP PGRI Tulungagung for the future. Interviews will also be conducted to the employees who will be selected by purposive sampling to determine the level of understanding of the vision, mission and strategy of the organization (PGRI STKIP Tulungagung) . The interviews were conducted with unstructured interviewing (Moleong, 2000; 138). Unstructured interviews will be conducted with no formal interviews. This interview was conducted so that the respondent was not awkward in expressing the truth. These conditions must be maintained because of the reliability and validity are important in the implementation of the study.

Documentation is done by documenting evidence about the number of students in the last four years, the market segment STKIP PGRI Tulungagung, the amount of training and rank which is owned by the employees.

After getting the required data then the data analysis steps are as follows:

a. Knowing the vision, mission and strategic goals STKIP PGRI Tulungagung then clarify and break them into four perspectives Balanced Scorecard
b. Determine the strategic objectives and performance measures, which are grouped into each perspective. Performance benchmarks used to measure the success of strategic objectives, which in this study are grouped into Lag Indicators as a measure of achievement of success of the organization, and Lead Indicators as a measure of performance triggers
c. Setting a target for every existing measures and alternative strategic initiatives that can help achieve the intended target, strategic initiatives can be re-engineered and work programs
d. Make the appropriate balance scorecard models and simplify the application, so it can

show the relationship between each perspective shown by the analysis of causality

RESULTS AND DISCUSSION

In general, the implementation of a balanced scorecard in STKIP PGRI Tulungagung as an educational institution refers to the strategy adopted. Prior to implementing the existing framework, this chapter is defined vision, mission, goals, and strategies of STKIP PGRI Tulungagung and parts in STKIP PGRI Tulungagung as the basis for determining the performance measures and targets to be achieved in accordance with the section responsible for achieve its vision and mission.

Measurement Performance with Balanced Scorecard

Performance measurement can be done by doing the translation process in the balanced scorecard to measure performance. The process can be carried out by translating the vision, mission, goals STKIP PGRI Tulungagung into three areas 1) What financial goals STKIP PGRI Tulungagung?; 2) what is critical to providing value to the consumer? ; 3) What do the STKIP PGRI Tulungagung in serving customers and how to attract and serve these consumers?. Based on these three things it will be associated with each perspective in balanced scorecard.
Gambar. 4-2. Tujuan Strategis Melalui Pengukuran Balance ScoreCard di STKIP PGRI Tulungagung Sumber : Data yang diolah

If the image above and the discussion of the four perspective Balanced Scorecard described more fully into strategic objectives, benchmarks, targets and strategic initiatives can be presented in Table 1 below:

Tabel 4-1

Rancangan Model Balance ScoreCard di STKIP PGRI TULUNGAGUNG

Tujuan Strategis	Tolok Ukur	Target	Inisiatif Strategis
Perspektif Keuangan 1. Meningkatkan sumber dana untuk kegiatan operasional dan pembangunan 2. Menggali sumber dana di luar sumber dana utama 3. Meningkatkan jumlah mahasiswa baru 4. Meningkatkan layanan keuangan kepada stakeholders	1. Peningkatan sumber dana sebesar 25% per tahun 2. Peningkatan sumber dana di luar sumber dana utama 3. Rasio pendaftar dibanding diterima 5 : 1 4. Peningkatan layanan keuangan kepada stakeholders	1. Meningkatnya sumber dana sampai 25% per tahun 2. Meningkatnya sumber dana diluar sumber dana utama sebesar 10% per tahun 3. Mulai tahun akademik 2012 – 2013, laporan keuangan unit kerja lebih transparan dan akuntabel 4. Pada empat tahun mendatang, semua stakeholders terlayani dengan baik	1. Peningkatan sumber-sumber keuangan utama 2. Peningkatan sumber-sumber diluar sumber dana utama dan dana-dana hibah 3. Penyusunan aturan- aturan keuangan tentang laporan keuangan yang transparan dan akuntabel 4. Melakukan inovasi- inovasi terkait dengan layanan keuangan 5. Memberikan kemudahan informasi kepada calon mahasiswa baru
Perspektif Pelanggan 1. Peningkatan kualitas layanan bagi mahasiswa dan alumni 2. Peningkatan kepercayaan masyarakat dan pelanggan lainnya 3. Pembangunan citra di masyarakat	1. Peningkatan kepuasan mahasiswa 2. Kemampuan meningkatkan kerjasama dengan pelanggan	1. Meningkatnya kepuasan mahasiswa sampai 50% selama setahun 2. > 80 % mahasiswa lulus tepat waktu 3. Meningkatnya kuantitas mahasiswa baru 5% per tahun 4. Telah dilakukan sepuluh kerjasama di bidang penelitian dan pengabdian pada masyarakat	1. Melakukan pelatihan service excellence bagi semua karyawan 2. Melakukan survey secara berkala terhadap kepuasan mahasiswa 3. Melakukan publikasi sampai lingkup Jawa Timur 4. Melakukan kerjasama dengan pihak eksternal dalam bentuk program penelitian dan pengabdian pada masyarakat
Perspektif Proses Bisnis Internal 1. Inovasi produk dan jasa baru 2. Perbaikan proses pembelajaran 3. Peningkatan produktivitas pendidikan	1. Jumlah inovasi produk dan jasa baru yang dihasilkan 2. Rata-rata IPK mahasiswa 3. Pemeliharaan dan peningkatan sarana dan prasarana 4. Parameter rata-rata waktu tunggu mendapatkan pekerjaan	1. Jumlah program studi baru yang dibuka sebanyak 4 buah 2. Peningkatan jumlah rata-rata IPK 3,00 3. Waktu mendapatkan pekerjaan maksimal enam bulan	1. Melakukan riset terhadap program studi yang diminati 2. Meningkatkan suasana akademik dengan pelatihan, seminar, diskusi, dan program lainnya 3. Meningkatkan sarana dan prasarana untuk perkuliahan, administrasi, dan layanan 4. Menjalin kerjasama dengan dunia industri terkait untuk program magang

Tujuan Strategis	Tolok Ukur	Target	Inisiatif Strategis
Perspektif Pembelajaran dan Pertumbuhan 1. Peningkatan kepuasan karyawan 2. Peningkatan kemampuan SDM 3. Pemanfaatan Teknologi Informasi	1. Tingkat indeks kepuasan karyawan 2. Jumlah peningkatan kualitas SDM 3. Jumlah teknologi informasi yang dihasilkan	1. Indeks kepuasan karyawan mencapai 4,00 dalam empat tahun 2. Dimilikinya sertifikasi profesi dosen rata-rata 15% per tahun 3. Semua karyawan telah mengikuti pelatihan administrasi dan service excellence 4. Semua karyawan dapat menjalankan dan memanfaatkan program aplikasi komputer sesuai bidang kerjanya	1. Membangun sistem jenjang karir 2. Menyusun sistem kompetensi 3. Menyusun sistem reward and punishment yang adil 4. Memotivasi dosen untuk meningkatkan jenjang kepangkatan 5. Menyelenggarakan pelatihan administrasi dan service excellence 6. Mengembangkan teknologi dan sistem informasi 7. Melakukan pelatihan teknologi informasi terkini

Sumber : Hasil Analisis

CONCLUSION

Based on the research results can be concluded as follows: a) Preparation of Balance ScoreCar d framework can assist in translating the vision and mission into objectives, benchmarks, targets and strategic initiatives. It is important for all organizations including STKIP PGRI TULUNGAGUNG will always be able to provide educational services to the community; b) application of Balance ScoreCard in STKIP PGRI TULUNGAGUNG done by analyzing the vision, mission and strategic goals STKIP PGRI TULUNGAGUNG which is then translated into the strategic measures, targets and strategic initiatives. It is expected to provide measures in the form of a program of work-work programs that can improve the performance STKIP PGRI TULUNGAGUNG overall in achieving the vision, mission and strategic goals STKIP PGRI TULUNGAGUNG; c) measurement of the balanced scorecard in STKIP PGRI TULUNGAGUNG done with four perspectives namely financial perspective, customer perspective, internal business processes, and learning and growth perspective. The results were as follows:

1) Financial perspective: (a) Increased funding sources for operations and development as indicated by the increase in funding sources by 25% per year; (b) Dig a source of funds outside of the main funding sources are indicated with an increased source of funds outside the main source of grant funds; (c) Improving the accountability and transparency of financial management indicated by can diverifikasinya financial report unit up to the evidence base; (d) Improving financial services to stakeholders indicated by an increase in services to stakeholders and financial services innovation; and (e) provide ease of information for new students

2) Customer perspective: (a) Improving the quality of services to students and alumni as indicated by the increase in student satisfaction; (b) Increased public confidence and more ditunjukka customers with the ability to increase cooperation with other customers

3) Internal Business Process Perspective: (a) Innovation new products and services as indicated by the number of product innovations (in the program) and the new services generated by STKIP PGRI TULUNGAGUNG; (b) Improving learning process as indicated by the increase in the average GPA of students, the average acceleration time of completing the study; (c) Increased productivity of education shown by

the improvement of facilities and infrastructure, and an increase in the average waiting time to get a job
4) Learning and Growth perspective: (a) Increased employee satisfaction shown by the increase Employee Satisfaction Inde; (b) Increased human resource capacity indicated by the number of improving the quality of human sumbe; (c) the use of information technology as indicated by the number of produced and utilized technology

Suggestions

In order to implement the Balanced Scorecard in STKIP PGRI TULUNGAGUNG required commitment and support of all employees ranging from top management to employees at lower levels. It should also be followed by a paradigm shift all employees on the balanced scorecard concept of customer satisfaction and employee satisfaction. Dissemination of the concept of the balanced scorecard should do before applying these concepts in performance measurement. STKIP PGRI TULUNGAGUNG must have a planning and development agency specifically tasked to formulate the vision, mission, goals and strategic objectives to further facilitate coordination with all work units. The organization also coordinates the annual work program all work units based on a strategic plan that has been set. But these institutions need to be supported by all the units so that the functions of management of the organization to run smoothly. To be able to know the progress in the implementation of the Balance ScoreCar d review mechanism effective and efficient must be established so that the organization regards the achievement of specific benchmarks and analyzes it to find the cause of problems and make necessary improvements
