PREFACE FROM THE EDITORS

The proceeding was produced based on paper and posters presented at the International Conference on Drug Development from Resources (ICDDNR) that was held in Jambuluwuk Malioboro Boutique Hotel, Yogyakarta, in June 30th, 2012.

This proceeding contains of research from various field in pharmacy including natural product chemistry, analytical chemistry, drug synthesis, drug formulation, pharmacology, clinical pharmacy and social pharmacy.

Hopefully, this proceeding will be useful for natural drug development and drug development in general. I would like to give appreciation for all member of editors that have been working hard to collect and review the manuscript.

Abstract

Background. Recent study reported that polyphenol compounds have a large contribution in antioxidant activity. Polyphenol compound was reported as one of the content of *Ocimum sanctum*. The aim of this study was to observe the antioxidant activity of lampes (*Ocimum sanctum*) leaves and seeds ethanol extract using DPPH method.

Method. The extraction was done using maceration method. The antioxidant activity was measured by DPPH method and gallic acid was used as comparative substance. Total phenolic content of ethanol extract was determined by spectrophotometric method with Folin-Ciocalteu reagent quantitatively. Furthermore, the effective Scavenging 50 (ES₅₀) value was calculated using linear regression between ethanol extract or galic acid concentration versus % of free radical scavenging. The ES₅₀ values were statistically analysis with anova and LSD Test.

Result. This study showed that ethanol extract of *Ocimum sanctum* seeds has antioxidant potency with ES₅₀ value was 131.81 μ g/ml > ES₅₀ of leaves (91.94 μ g/ml) > ES₅₀ of gallic acid (3.54 μ g/ml) ($p < 0.05$). The total phenolic content of ethanol extract of *Ocimum sanctum* leaves was 41.33 mg/gram, while the phenolic content of ethanol extract of seeds was 26.81 mg/gram which was expressed as gallic acid equivalent (GAE).

Key words : *Ocimum sanctum*, leaves, seeds, ethanol extract, antioxidant activity, DPPH method.

4

INTRODUCTION

The role of free radicals in many disease conditions has been well established. Several biochemical reaction in our body generated reactive oxygen species and these are capable of damaging crucial bio-molecules. If they are not effectively scavenged by cellular constituent, they lead to disease conditions such as cancer, atherosclerosis, aging, inflammatory, diabetic, hair fall, and neuro-degenerative disease like Alzheimer and Parkinson (Surveswaran, *et.al.*, 2007) (Halliwell & Gutteridge, 1999). The harmful action of free radicals can, however, could be blocked by antioxidant substances, which scavenge free radicals and detoxify the organism.

Synthetic antioxidants, such as butylated hydroxyanisole, butylated hydroxytoluene and tertiary butylhydro-quinone, have been widely used in food for preventing lipid peroxidation. However, the use of these synthetic antioxidants in food is discouraged because of their toxicity and carcinogenicity (Soonan Barlow, 2004). A few natural antioxidants have attracted special interest because of their ability to scavenge free radicals. Natural antioxidants such as phenolics, flavonoids, tannins, etc are found in various plant products such as leaves, seeds, fruits, etc.

Lampes (*Ocimum sanctum*), in India was widely used in ayurvedha. It's used in many medicated of many disease, such as bronchitis, diarrhea, dysentery, skin disease etc. In some region of Indonesia, lampes was used as spices. The other studies reported that Lampes has a protective effect against genotoxicity, chemical-carcinogen, myocardial damage induced isoproterenol. Lampes also has hepatoprotector, anti-inflammatory, antidiabetic, antiulcer effect. Muthuraman *et al* (2008) reported that Lampes's leaves consist of flavonoid (luteolin, orientin, vicenin), triterpenoid (ursolic acid); fixed oil (palmitic, stearic, linoleic, linolenic), essential oil (eugenol, champhor, carvakol, caryopelen, desyaldehyde, nerol, cirsilineol, cirsimartin), tannin, etc.

6

The aims of this study were to determine the radical scavenger activity and the Total phenolic content of Lampes's leaves and seeds extract compared with gallic acid as standard

METHODS

Materials

Lampes (*Ocimum sanctum*) leaves and seeds were obtained from Karanganyar, Central Java; DPPH (Sigma), Folin-ciocalteu reagent, Na₂CO₃, quercetine p.a. (Merck), 96% ethanol (Brataco Chem.), gallic acid p.a. (sigma) dan methanol p.a. (Merck), aquadest (Brataco Chem.).

Method

Preparation of Lampe's leaves and seeds extract

The Lampes's leaves and seeds were washed thoroughly in tap water to remove adhering mud particles, rinsed in distilled water, drained, and dried in hot air oven at 50±2°C. The dried leaves and seeds were finely powdered. About 20 grams of each dried powder were extracted in 300 ml portions of ethanol, shaken with ultrasonic for 1 hour. The extract were filtered or filtered after 24 hours and the extraction was repeated with fresh ethanol until the extract was colorless. The extracts were pooled and evaporated in a rotary evaporator.

DPPH radical scavenging activity assay

The Free radical scavenging activity against 2,2-diphenyl-1-picrylhydrazyl (DPPH) radicals was measured spectrophotometrically. The radical scavenging activity assay was done by DPPH method because of it's a stable substance, commercially available, and does not have to be generated before assay. Therefore, it is considered an easy and useful spectrophotometric method. This method is based on the decrease intensity or absorbance at 517 nm of DPPH in the presence of the extract.

Different dilution of extract were prepared (5 times replicated). Then 1.0 ml of each dilution was added to 1.0 ml of 0.15 mM

2

DPPH. The mixture was allowed to stand about 30 min before measuring the absorbance at 517 nm. Lower absorbance of the reaction mixture indicated higher free radical scavenging activity. The scavenging of DPPH radical in percent was calculated by equation :

Scavenging Activity (%) = $(1 - A_1/A_0) \times 100\%$. A_0 was the absorbance of control reaction and A_1 was the absorbance in the presence of extracts, gallic acid was used as positive standart.

The Effective Scavenging 50% (ES₅₀) was calculated by interpolated the 50 as Y value into the regresioon linear equation between concentration vs. % of radical scavenging activity. The lower ES₅₀ value showed the higher scavenging activity of the solution test (Pokorny, *et.al.*, 2001).

The ES₅₀ values were statistically analysed. The Kolmogorof-smirnof test result showed that the ES₅₀ datas were normal, the Levene test showed a homogeneity of data. The statistical analysis was followed by anova analysis. It's indicate that there were significantly differences among the ES₅₀ values. The posthoc (LSD) test result showed that each ES₅₀ value was significantly different.

Determination of polyphenol

The present of polyphenol in the extracts was determined by the formation of greenblue colour after added FeCl₃ solution into the diluted extract.

24

The Total polyphenol content (TPC) of leaf and seed extracts were determined spectrophotometrically using Folin-Ciocalteu's reagent. Three hundred microlitre of samples were added into test tubes followed by 1.5 ml of Folin-Ciocalteu reagent (diluted 10 times) and 1.2 ml of sodium carbonat 7.5%. The content of the tubes were mixed thoroughly and stored in the dark for 36 min before the absorbance was measured at 743.5 nm using Pharmaspec UV-1700 Shimadzu. TPC was expressed as mg gallis acid equivalents (GAE) per g of extract.

RESULT AND DISCUSSION

This study showed that the lampes's leaves and seeds ethanol extract have potency as free radicals scavenger.

The reaction between DPPH radical phenolic compound is presented in figure 1.

Figure 1. Free Radical scavenging reaction by phenolic compound (Son and Lewis, 2002)

The scavenging of DPPH radical activity of gallic acid and the ethanol extract of leaf and seed of Lampes are presented in table I, table II and table III.

• p < 0.05

The presence of Hydroxy phenolic groups in Gallic acid has contributed to the higher activity as radical scavenger. In the other hand, the ethanol extract has lower radial scavenger activity. This fact can be explained that the gallic acid was a single compound, while the extract was a mixture of many compound that has possibility either have or no radical scavenger activity.

Figure 2 presented the phytochemical constituent of ethanol extract ie. flavonoid (luteolin, orientin, vicenin), tannin, etc (Muthuraman,et al, 2008) were predicted as the main role in radical scavenging activity.

It can be understood that a number of hydroxyphenolic groups in those compounds have a wide contribution to the radical scavenger activity.

In the other hand, there were significantly differences of ES₅₀ value between leaves extract

Figure 2. Some flavonoid compound in Lampes's extract

and seeds extract. The ES₅₀ value of leaves extract was (91.94±1.7) mg/ml less than (131.81±05.968) mg/ml (ES₅₀ of seeds extract 30 (p<0,05). This phenomenon was in line with the total phenolic content of each extract. The

leaves's extract has higher content of TPC (41.33 ± 1.36) mg/g GAE > seed's extract (26.81 ± 0.73) mg/g GAE.

The other studies reported that there was a positive correlation between the level of TPC vs radical scavenging ctivity. The higher level of TPC has higher radical scavenger activity.

This result recognized to be combined by others method of antioxidants assay to represent as antioxidant capacity ie. Thiobarbiruric acid method, Ferric reducing antioxidant power, deoxyribose method, etc.

CONCLUSION

Ethanol extract of Lampes's leav²⁹ and seeds have potencial activity as radical scavengers. The radical scavenging activity of extracts were lower than gallic acid's. It was explained by the ES50 value of gallic acid < leaf extract (91.94 ± 1.7) mg/ml < seed extract (131.81 ± 05.968) mg/ml. The Leaves's extract has higher content of TPC (41.33 ± 1.36) mg/g GAE > seed's extract (26.81 ± 0.73) mg/g GAE. Furthermore, it's need to research to determined the real correlation between TPC of extract vs free radical scavenger activity.

ACKNOWLEDGMENTS

We thank the Research and Development Department and the faculty of Pharmacy of Ahmad Dahlan University for the research support.
