ABSTRACT

Introduction: Satisfaction with anti-DM drug therapy can affect the effectiveness of and adherence to treatment in diabetic patients. This study aims to determine the description of satisfaction with anti-DM drug therapy for type 2 D.M. patients in primary care.

Method: The design of this study was a cross-sectional study of D.M. Patients. We included 109 DM Patients Participants. Data is collected from a perspective and carried out by face-to-face interviews using a questionnaire. We used the Therapy satisfaction questionnaire Medicine (TSQM) for assessing satisfaction with anti-DM drug therapy. We performed uni- and bivariate data analysis using the free-to-play version of SPSS. Characteristic of subject and TSQM scores were presented descriptively.
