**Abstract:** The influence of teachers' commitment and burnout on student learning outcomes and their performance requires astute research to identify the antecedent factors of these two variables. Commitment and burnout are peremptorily related to the positive and negative aspects of performance, respectively. Most of the previous research showed inconsistency, therefore, a new assay is needed to produce more convincing findings. This study aims to identify the antecedent variables of teachers' commitment and job burnout by using meaning at work as a mediating variable. Based on the random sampling technique, 304 respondents were selected among the teachers in private primary and secondary education levels in the East Kalimantan Province, Indonesia. A structural equation model (SEM) was used in the data analysis. The results showed that school support, self-actualization, and meaning at work were antecedent variables for teachers' commitment and burnout. The meaning at work also mediates the relationship between school support and self-actualization. Meanwhile, the remaining four mediating roles were not proven in this research. These findings offer a framework for principals to increase commitment and reduce teachers' burnout by increasing school support and self-actualization through meaning at work.

## 1. Introduction

The empirical evidence of teacher's role in student learning outcome [1] require an astute research on the collection of factors associated with successful educational system [2]. A productive teacher has certain characteristics however, previous research has succeeded in indicating various related variables, such as commitment [3] and burnout [4], which greatly influence the performance of student learning outcomes [5]. The personal intervention related to the two variables has a positive effect on their performance as well as on student learning achievement [6]. Commitment and burnout are in correlation with the positive and negative aspects of teachers' performance [7].

Commitment is important in maintaining professional motivation and promote teachers to be responsive to changes in learning practices [10], and is further classified into two, namely organizational and professional aspects [8]. Organizational commitment is the relative strength of teacher's involvement and the willingness to make sacrificial efforts on behalf of the school [10]. Professional commitment describes the teacher's involvement level and the importance of work rendered in general. This research [11] also explained that commitment, both affective and normative, predicts well-being, growth opportunities, recognition, and job satisfaction. Contrary to commitment which is a positive aspect of teaching, tutors' burnout is a variable that reduces negative elements

related to other performance. Research [12] stated that burnout manifest in all types of work, but it is mainly experienced by teachers because their daily job demands and pressures [13].

Teachers' burnout is associated with multiple experiences and negative outcomes. The teaching profession is reported as a job with a high risk of burnout [18]. In the work environment, they often face challenges, such as getting cynicism from co-workers or unpleasant treatment. Emotional exhaustion and mood swings eventually lead to burnout [14][15]. This provides a lower impetus in responding to student learning achievements [7]. Teachers also tend to have a negative relationship with students for example, getting angry when pupils do not follow instructions and have contradicting views [21]. The burnout that occurs also affect the probability of staying in the job [22]. This is because it leads to increased absenteeism, lower work commitment, enhanced desire [16]. Teachers' fatigue also have an impact on students through a contagion effect, here burnout passes from tutors to their pupils [17], because learners have a tendency to pick up and imitate emotional cues [25]. This implies that students also face direct consequences of burnout, such as decreased achievement [18], increased forms of controlled motivation [19], and depression [20]. Due to the significance of teachers' commitment and burnout on their performance and pupils' achievement, the antecedents of these two variables required to be determine.

This research outlined three independent variables, namely transformational leadership, school support, and self-actualization, which are predicted to affect teachers' commitment and job burnout. The empirical relationship between these variables was investigated, but there are still inconsistencies in results of these studies. In research that expressed transformational leadership as an independent variable, the majority of the results showed a positive effect on teacher commitment. In line with these findings, Pietsch et al. [21] stated that "teachers who feel that their principals have better understanding of their intrinsic needs, recognize their abilities, develop and empower them individually are more strongly committed to their schools than their peers". Research with similar results stated that transformational leadership predicts commitment to both organizational and professional commitment [22][23][24][33][25][26][27][28]. The principal's role as a transformational leader is key in ensuring teacher commitment [29]. Other results by [30][31][32][33] also showed that when principals act as transformational leaders, teachers feel a higher commitment to the school. Headteacher who apply leadership that builds positive relationships affect commitment [34] and negatively impact burnout [35]. Principal and teacher relationships increase work commitment [43]. Although many results showed that there is a significant effect of transformational leadership on teachers' commitment and burnout. [36] explored the relationship between teachers' perceptions of principals' leadership and commitment. The results showed that transformational leadership was uniquely associated with organizational trust and efficacy, but not with teachers' commitment. Additionally, similar research was also conducted by Cahyono et al. [37], although the context is slightly different, it showed that, among the 4 transformational leadership sub-variables, only one affects teachers' commitment (namely intellectual stimulation). While the other three sub-variables (ideal effect, inspirational motivation, and individual considerations) do not affect organizational commitment in higher education. This trend is also supported by Ling et al. [38], although it has a correlation between transformational leadership and teachers' commitment, but it has a weak effect.

The influence of the second independent variable (school support) on teachers' commitment and burnout also contains inconsistencies. Most research showed that employee perceived support is positively related to adaptability and negatively related to burnout and disengagement [39]. Organizational support has an impact on several indicators of employee performance, such as decreased absenteeism and increased commitment and job satisfaction [40]. Support and quality of leader relationships affect teachers' commitment and burnout [41]. Perceived organizational support (POS) serves to

meet socio-emotional needs (for example rewards, affiliati<sup>15</sup> and emotional support) and leads to affective commitment. [49]. POS which involves employees' perception that the organization values their contributions and cares about their well-being, is the most strongly associat<sup>34</sup> work experience with the emotional attachment to the establishment [42]. However, little is known about the effect of perceived organizational support on education [43], which is similar to the self-actualization variable. Several studies have stated that self-actualization affects organizational commitment [44] [45], but there is no very convincing empirical evidence about this relationship. Based on the inconsistency of independent influence on the dependent variable, this research used meaning at work as a mediating factor. This is predicted to mediate between the three independent variables on the two dependents.

Based on the above background, this research aims to: (1) Investigate the effect of transformational leadership, school support, and self-actualization on meaning at work, (2) Examine the impact of transformational leadership, school support, self-actualization, and the meaning at work on teachers' commitment and burnout (3) Determine whether the meaning at work mediates this relationship. These results contribute (1) to filling the gap in the literature on the relationship between teachers' commitment, burnout, and the meaning at work, because, there is few empirical research that examine the antecedents and consequences of meaning at work. (2) Based on the education management perspective, teachers' commitment and burnout are important outcomes of school support, transformational leadership, and self-actualization. Given the importance of commitment and the low level of burnout in education, school management should maintain the commitment by minimizing teachers' burnout. Furthermore, (3) this research used the meaning at work as a mediator, in respect to this model, schools have more opportunities to recruit productive teachers with the assurance of school support and recognizing the teaching profession as meaningful work.

1.1. Hypothesis

Based on the theoretical assumptions described in the previous section, the research hypothesis is formulated as follows:

- H1: School transformational leadership increases the teacher's meaning at work
- H2: School support increases the teacher's meaning at work
- H3: Self-actualization increases the teacher's meaning at work
- H4: Meaning at work increases teachers' commitment
- H5: The meaning reduces their burnout
- H6a: Meaning at work mediates the positive influence of school transformational leadership on teaching commitment
- H6b: Meaning at work mediates the positive effect of school support on teaching commitment
- H6c: Meaning at work mediates the positive effect of self-actualization on teaching commitment
- H6d: Meaning at work mediates the negative effect of self-actualization on the burnout
- H6e: Meaning at work mediates the negative effect of school support on the burnout
- H6f: Meaning at work mediates the negative effect of transformational leadership on the burnout

## 2. Materials and Methods

### 2.1. Data Collection

This cross-sectional research aims to determine the relationship between the independent and dependent variables as the basis for discovering the factors that influence teachers' commitment and job burnout using the AMOS SEM model [54]. It includes 6 types of variables, namely; 1) three exogenous (the principal's transformational

leadership, school support, and student self-actualization); 2) one mediator (meaning at work), and 3) two endogenous (the commitment and the level of burnout). 154  
155

### 2.2. Research respondents 156

The research respondents consisted of 304 teachers from Private Elementary, Junior 157  
High, and Senior High School/Vocational in East Kalimantan Province, Indonesia with 158  
the demographic details described in Table 1. 159

**Table 1.** Demographics of respondents 160

Profile	Description	Total Respondents	Percentage
Gender	Male	128	42%
	female	176	58%
School Type	Elementary School	107	35,2%
	Junior High School	91	29,9%
	Senior High School	106	34,9%
Education Level	Senior High School/Vocational High School	40	13%
	Diploma 3	12	4%
	Bachelor Degree	224	74%
	Master Degree	27	9%
	Doctor Degree	1	0%
Work experience	0-5 years	136	45%
	6-15 years	110	36%
	16-25 years	48	16%
	> 25 years	10	3%

### 2.3. Data Collection Instruments 161

The data collection was carried out using 6 types of questionnaires representing each 162  
research variable, namely (a) The principal transformational leadership adopted from 163  
Bass and Riggio [46], (b) The school support obtained from Lam et al. [47], (c) Student self- 164  
actualization adopted from Robbins et al. [57], (d) Meaning at work obtained from Steger 165  
& Duffy [48] (e) Teachers' commitment adopted from Allen and Meyer [49], as well as (f) 166  
Teachers' burnout level obtained from Dorman [50]. Each variable was developed into 167  
several indicators as described in Table 2. 168  
169

**Table 2.** Variable Indicator 170

Variable	Indicator	Code
Principal's transformational leadership	1. Idealized influence Leaders are perceived as inspiring role models for their subordinates including: a. consistently acting in accordance with the values adopted by the management of student activities, b. role model for subordinates, and c. involving subordinates in designing various school programs.	TL1
	2. Motivational inspiration The leader shares a vision that attracts and motivates subordinates by conducting the following: a. direct teachers to focus on the needful, in order to succeed,	TL2

- |                |   |     |
|----------------|---|-----|
|                | <ul style="list-style-type: none"> <li>b. makes the teachers work with enthusiasm and optimism, and</li> <li>c. encourages subordinates to work hard to achieve common goals.</li> </ul>  |     |

Intellectual stimulation</li> </ul> <p>Leaders stimulate their subordinates to be creative and innovative by performing the following:</p> <ul style="list-style-type: none"> <li>a. help solve problems based on strong evidence and arguments, rather than unfounded opinions,</li> <li>b. makes the teachers tackle problems from a different perspective, and</li> <li>c. encourage teachers to attempt new strategies in learning.</li> </ul>  | TL3 |
|                | <ul style="list-style-type: none"> <li>4. Individual consideration</li> </ul> <p>Leaders provide support, reassurance, and guidance to subordinates by paying attention to individual needs, as follows:</p> <ul style="list-style-type: none"> <li>a. treat subordinates as individuals with unique needs and skills</li> <li>b. pay attention to the opinions of subordinates in respect to their responsibilities</li> <li>c. pay attention to the personal needs of subordinates</li> </ul>   | TL4 |
| School support | <ul style="list-style-type: none"> <li>1. Competence support</li> </ul> <ul style="list-style-type: none"> <li>a. provide opportunities and facilities for subordinates to develop competence</li> <li>b. provide sufficient training, therefore subordinates have good teaching skills</li> <li>c. take into account the workload and sufficient time for subordinates</li> <li>d. properly coordinate programs for all parties</li> </ul>   | SS1 |
|                | <ul style="list-style-type: none"> <li>2. Autonomy support</li> </ul> <ul style="list-style-type: none"> <li>a. formul<sup>g</sup> school programs, especially those related to the teaching and learning process</li> <li>b. listen to the opinions of teachers and use them as material for the development of the learning process</li> <li>c. participate in various activities at school voluntarily</li> <li>d. schools provide freedom in planning and implementing learning</li> <li>e. the principal listens to subordinates' ideas</li> </ul> | SS2 |
|                | <ul style="list-style-type: none"> <li>3. Collegial support</li> </ul> <ul style="list-style-type: none"> <li>a. there is a promotion of enthusiasm among co-workers in dealing with teaching difficulties</li> <li>b. sharing resources that support teaching tasks among colleagues</li> <li>c. share experiences that support teaching tasks among colleagues</li> <li>d. coworkers are interested in each other's difficulties</li> </ul>   | SS3 |

	e. cooperation is established between colleagues in carrying out teaching tasks	
Student self-actualization	1. Growth needs	SA1
	2. The need for achieving one's potential	SA2
	3. Self-fulfillment needs	
	4. Encouragement needs	SA3
Meaning at work	1. Positive meaning	SA4
	2. Meaning making through work	MOW1
	3. Greater motivations	MOW2
Teachers' Commitment	1. Teaching Commitment	MOW3
	2. Organizational Commitment	TC1
Teachers' Burnout Level	1. Emotional exhaustion	TC2
	2. Physical exhaustion	TB1
	3. Depersonalization	TB2
		TB3

The questionnaire was made using a Likert scale from a score of 1 to 5, with the information collected in the form of interval data. The score of 1 for "strongly disagree", 2 for "disagree", 3 for "undecided", 4 for "agree", and 5 for "strongly agree". These are different for negative statements, i.e., a score of 5 for "strongly disagree", 4 for "disagree", 3 for "undecided", 2 for "agree", and 1 for "strongly agree".

#### 2.4. Data Analysis

The data analysis used a structural equation modeling (SEM) with the AMOS application [51]. The SEM analysis was used to determine the relationship between the principal transformational leadership, school support, and student self-actualization as exogenous variables with meaning at work as mediating variables and teaching commitment and burnout levels as the endogenous. The considerations for using AMOS as SEM analysis software are; 1) the availability of various SEM imaging tools, and 2) accuracy, speed, and ease of AMOS in SEM path analysis (Byrne, 2001). SEM analysis is divided into two, namely the measurement model for explaining the relationship between variables with their indicators. While structural design is used for expressing the relationship between variables (Gerbing & Anderson, 1988). In the AMOS SEM, Regression Weight Output is obtained to determine the acceptable level of the proposed hypothesis.

### 3. Results

Based on data analysis, these findings are divided into three, namely the measurement, structural, and hypothesis model.

#### 3.1. Measurement Model

The measurement model provides the relationship of values between the observed indicator and the constructs that are designed to be measured (unobserved latent variables). It was analyzed using Confirmatory Factor Analysis (CFA) to produce the validity of the indicator variables [51]. The variable indicators described in table 2 have passed the validity test with CFA analysis on AMOS. The validity of the indicators was determined from the results of the CFA (confirmatory factor analysis) test with the provisions of the CR (critical ratio) > 1.96 and probability or  $p < 0.05$ . In this research, the validity of each indicator is shown in Table 3.

Description: \*\*\* = p value < 0,001

CR value > 1.96 and probability < 0.05 from table 3 shows that e<sub>46</sub> variable indicator has met the validity requirements and reflected the variables. The validity test was also carried out by using the standardized loading estimate or factor > 0.5 as shown in table 4. It shows when the indicator for each variable has exceeded the required loading factor.

3.2. Structural model

212

The structural model describes the relationship between latent variables [52][53], such as exogenous, mediating, and endogenous. The validity of the structural model is measured by the GOF (Goodness of Fit) value or the feasibility test by using the achievement of the index suitability criteria and the cut-off point [63]. These indices are GFI, AGFI, CMIN/DF, TLI, CFI, and RMSEA. The GFI and AGFI are references to describe the level of model suitability with a size range of 0 (poor fit) to 1.0 (perfect fit). The GFI and AGFI values are close to 1.0, indicating that the tested model has a good fit (Arbuckle, 2014). The results obtained for the value of GFI 0.915 and AGFI 0.883 proved that the model is a good fit. The CMIN/DF and TLI become indicators to measure the fitness level of the model with the criteria of CMIN/DF 2.0 and TLI 0.95 (Byrne et al., 1989). The analysis indicated the value of CMIN/DF at 1.966 and TLI at 0.935, stating that the criteria for the model acceptance were met. The next two criteria that determine the model acceptance level include (a) the CFI with a value criterion of 0 – 1, where the closer to 1, the higher the level of acceptance (Arbuckle, 2014), and (b) the RMSEA with criteria of 0.08 (Cudeck & Browne, 1983). The CFI was 0.917 and the RMSEA was 0.058, indicating a high model acceptance level, as described in Table 5.

3.3. Hypothesis testing

The hypothesis test in the SEM AMOS was carried out using the Critical Ratio (CR) and p-value in the output regression weights table, with the condition that the hypothesis is accepted when the CR value is > 1.96 and p < 0.05. The influence between variables is determined by the existing estimate value. The results of the hypothesis testing are shown in Tables 6 and 7.

	SA	SS	TL	MOW	TB	TC
MOW	,000	,000	,000	,000	,000	,000
TB	,196	,385	-,045	,000	,000	,000
TC	,266	,522	-,062	,000	,000	,000

Based on the hypothesis testing shown in tables 6 and 7, the following proofs were obtained:

1. H1.1: There is an effect of the principal's transformational leadership (TL) on the teacher's meaning of work (MOW). The hypothesis of the effect of TL on MOW has a CR value of 0.435 and  $p = 0.663$ . Therefore, this hypothesis is rejected, because it does not meet the criteria for CR values  $> 1.96$  and  $p < 0.05$ .
2. H1.2: There is an effect of school support (SS) on the teacher's meaning of work (MOW). The hypothesis of the effect of SS on MOW has a CR value of 2.708 and  $p = 0.007$ . Therefore, this hypothesis is declared accepted, because it has met the criteria for CR values  $> 1.96$  and  $p < 0.05$ .
3. H1.3: There is an effect of self-actualization (SA) on the teacher's meaning of work (MOW). The hypothesis of the effect of SA on MOW has a CR value of 2.188 and  $p = 0.029$ . Therefore, this hypothesis is accepted, because it has met the criteria for CR  $> 1.96$  and  $p < 0.05$ .
4. H1.4: There is an effect of the teacher's meaning of work (MOW) on teaching commitment (TC). The hypothesis of the effect of MOW on TC has a CR value of 7.086 and  $p = 0.000$ . Therefore, this hypothesis is declared accepted, because it meets the criteria for CR value  $> 1.96$  and  $p < 0.05$ .
5. H1.5: There is an effect of teacher's meaning of work (MOW) on the level of teacher's burnout (TB). The hypothesis of the effect of MOW on TB has a CR value of 6.267 and  $p = 0.000$ . Therefore, this hypothesis is declared accepted, because it has met the criteria for CR  $> 1.96$  and  $p < 0.05$ .
6. H1.6a: There is an indirect effect of transformational leadership (TL) on the level of teacher's fatigue (TB) mediated by Meaning Of Work (MOW). Based on table 7, this hypothesis is rejected, because the indirect effect of TL on TB mediated by MOW has an estimated value ( $\beta$ ) of  $-0.045 < 0.000$ .
7. H1.6b: There is an indirect effect of transformational leadership (TL) on teacher's commitment (TC) mediated by Meaning of Work (MOW). Based on table 7, this hypothesis is rejected because the indirect effect of TL on TB mediated by MOW has an estimated value ( $\beta$ ) of  $-0.062 < 0.000$ .
8. H1.6c: There is an indirect effect of school support (SS) on the level of teacher's fatigue (TB) mediated by Meaning of Work (MOW). Based on table 7, this hypothesis is accepted, because the indirect effect of SS on TB mediated by MOW has an estimated value ( $\beta$ ) of  $0.385 > 0.000$ .
9. H1.6d: There is an indirect effect of school support (SS) on teaching commitment (TC) mediated by Meaning of Work (MOW). Based on table 7, this hypothesis is rejected, because the indirect effect of SS on TC mediated by MOW has an estimated value ( $\beta$ ) of  $0.522 > 0.000$ .
10. H1.6c: There is an indirect effect of self-actualization (SA) on the level of teacher's fatigue (TB) mediated by Meaning of Work (MOW). Based on table 7, this hypothesis is accepted because the indirect effect of SS on TB mediated by MOW has an estimated value ( $\beta$ ) of  $0.196 > 0.000$ .
11. H1.6d: There is an indirect effect of self-actualization (SA) on teaching commitment (TC) mediated by Meaning of Work (MOW). Based on table 7, this hypothesis is

rejected, because the indirect effect of SS on TC mediated by MOW has an estimated value ( $\beta$ ) of  $0.266 > 0.000$ .

#### 4. Discussion and Conclusion

The data analysis, in general is divided into two, namely: six accepted and five rejected hypotheses. Hypothesis 2 which showed that school support has an effect on teacher's meaning of work is accepted. Hypothesis 3 which indicated that self-actualization affects the teacher's meaning of work is accepted. Hypothesis 4 which expressed the effect of teacher's meaning of work on teaching commitment is accepted. Hypothesis 5 which explained the effect of teacher's meaning of work on tutor's burnout is accepted. Meanwhile, hypothesis 6 which showed the meaning of work mediates the relationship between the antecedent and the consequence variables is partly supported and rejected.

The results indicated that the teacher's meaning of work has two antecedent factors, namely school support and self-actualization. School support received by teachers is their general perception about how important it is for institutions to contribute to their interests and well-being. Teachers who feel they received more support from the organization recognize the efforts. According to the theory of perceived organizational support (POS), members who received valuable resources from the organization, for example in the form of salary increment, opportunities to attend training, and various self-development activities, have a higher sense of responsibility in helping to achieve organizational goals, as a form of reciprocation to the organization according to the norm of reciprocity [54] [55]. Organizational support has an impact on several indicators of employee performance, such as decreased absenteeism, increased commitment, and job satisfaction [40]. Perceived organizational support is an indicator of organizational concern [66]. It makes members feel that the organization is willing to provide the resources they needed, to support the growth and development in their capacities [56]. Based on the conceptual framework of the POS theory, the support felt by teachers from schools is seen as their perception of how the institution values their efforts, cares about their welfare, and appreciates all their performance. Based on the theory [57], this conceptual framework enable teachers to feel positive in carrying out their duties. Feeling positive at work is one of the four critical attributes of meaning at work. Meaning at work is obtained when someone feels that their job is important and has a valuable purpose [48]. This framework is also related to one of the three aspects of the conceptualization belonging to [58], which stated that the support they receive from the organization enables an individual to gain sense of meaning at work. Teachers' involvement in school-wide policy-making is positively related to individual professional commitment [59].

The meaning at work is also influenced by the self-actualization variable, enabling individuals to use their full potential [60]. According to Maslow, self-actualization is the highest human need [61]. The fulfillment of this need lead an individual to achieve mental health and desired personal goals. For teachers, self-actualization is important after carrying out various activities that boost their potential and competence to become professional educators [62]. Forms of self-actualization are carried out by building awareness of the main role of a teacher and developing strategic steps to continue to improve their competencies. The research conducted by [63], showed that self-actualization improved teachers' performance. A self-actualizing individual is able to think about the complexities of life, balance, and integrate emotions into real-life realities. Teachers make choices that support their growth even in difficult conditions. They also overcome various dilemmas they face, such as anxiety, disappointment and doubt [64]. People who have achieved self-actualization become servants of life. These findings are in line with several previous research which explained that, self-actualization is a major source of sense of meaning at work [65][66]. Research [67] explains that self-actualization is a source of meaning at work, which accounts for 8.5% of an individual lifestyle.

The meaning at work also fully supports the consequence variables, namely teacher's commitment and fatigue. This implies that the high meaning of work increases their commitment and reduces work fatigue. In the first case, this finding supports previous research that meaning at work affects one's work commitment [79][80][81][82]. It succeeded in confirming a positive relationship with organizational commitment [69]. According to Morrison et al. [70] and Leape et al. [71], the concept of meaning of work has been suggested as an approach to increase one's commitment. Some literature showed that a person's commitment grows when the values and goals of the organization are identified. The identification enhances a person's willingness to work on behalf of and remain in the organization [86]. Awards and support, achievements achieved, and organizational involvement affects a teacher's commitment [72]. The meaning of work helps create a school environment that encourages teacher's commitment, prevents dropouts from their profession, and improves the quality of education[73].

Besides fully support the commitment of teachers, meaning at work also has a negative effect on burnout level. Those with high meaning at work reduce burnout levels, and vice versa. The burnout level is a description of the gradual process of fatigue and the loss of commitment at work [8]. The reduced burnout is directly proportional to work involvement, which is a positive factor in performance [89]. It has a lot of negative impacts on teachers, for example, they become more critical and respond slower to student success [7], teacher's intention to quit [74], lower pupils' motivation and academic achievement [75][76], lower job satisfaction [77], and even detrimental to health [78]. Furthermore, 19-30% of teachers stop working because of burnout [79]. High burnout is influenced by anxiety, stress, lack of administrative support [79], and low quality of social interaction in schools [80][81]. This research supports several previous findings that, low meaning at work is a predictor of teacher's burnout. The fulfillment of existential needs prevents burnout [82]. An individual who is oriented towards achievement and meaningful goals is able to reduce burnout [83][84]. The findings indicated that meaning at work is an important variable in reducing burnout. Meaning at work is influenced by the existence of a calling orientation, where someone works because they perceive the calling [85]. Increased meaning at work intensified awareness in daily work [86]. Therefore, the results help in establishing schools that promote job satisfaction and the delivery of high-quality education [73].

In contrast to the findings of this research, the hypothesis that considers the effect of transformational leadership on teachers' sense of meaning at work is not significantly supported by the data. This finding is in contradiction with most of the previous research, which showed that transformational leadership is an important predictor of meaning at work [87]. This makes teachers feel respected and trusted [88]. Transformational leaders maintain good relationship with employees and cause perceptions of the organization's reputation to be better [89]. The four hypotheses linking the mediating role of meaning at work are not significantly supported by the empirical data. This is because, it did not mediate the effect of transformational leadership on burnout and commitment, school support on commitment, and self-actualization commitment. The reason behind these findings is related to the population. The main objective of this research is to identify the antecedent factors of teachers' commitment and burnout. Considering this objective, this research focuses on teachers in private schools, from primary and secondary education levels. The results of Sun et al. [90] explained the context of this research, in which the principal's transformational leadership is associated with three sets of antecedents, namely leader qualities (including self-efficacy, values, traits, and emotional intelligence), organizational features, and the leader's colleagues' characteristics ( e.g., follower's initial developmental level). In the context of schools in Indonesia, these three sets of leadership qualities are lacking in private institutions compared to the government-owned.

This research has both theoretical and practical contributions. Theoretically, it indicated that teachers' commitment increases when they recognize their meaning at work. This indicates that when teachers complete the important and valuable tasks, they

conduct this with all their mind, knowledge, skills, and dedication to the school organization. The meaning at work also reduces teachers' burnout levels. The feeling that their work is meaningful, amplifies positive emotions, creates meaningful goals, and job satisfaction [57] Therefore, making the level of burnout at work to decrease, which in turn have an impact on their intention to stop teaching [90], increase job satisfaction [93], improve mental health quality [94], decrease anxiety in teaching [95], and enhance the care for student learning achievement [7][75][76]. For sense of meaning at work to increase, there is need for support from school organizations and teacher self-actualization. In this research, these two variables simultaneously increase the sense of meaning at work. Furthermore, the mediating effect is partly supported by this research, which increases the understanding of how school support and self-actualization increase commitment and reduce burnout. The mediating role of meaning at work shows that the teachers' perception of their work is an important factor in determining commitment. The findings supported the argument that meaning at work plays a mediating role in the relationship between school support and self-actualization with teachers' commitment and burnout. Finally, this research offers a more comprehensive concept of sense of meaning at work and provides empirical evidence that school support and self-actualization lead to higher levels of teachers' commitment and reduce burnout in their profession.

The findings offer a framework for principals to increase commitment and reduce teachers' burnout by increasing school support and self-actualization through meaning at work at work. It is observed that school support and self-actualization increase meaning at work, therefore, principals should emphasize that school organizations provide full support and the widest opportunity for teachers to achieve self-actualization. To increase school support, principals are required to create a fair institution climate [91][92], provide opportunities for growth [93], support superiors [94], and colleagues[95][96]. Meanwhile, to increase self-actualization, principals should increase teachers' involvement and job satisfaction [113][114], provide freedom of choice [115], growth opportunities, psychological comfort, and security [97]. The principal's ability to establish good interactions also predicts the perception of school support toward teachers' well-being [98].
