### Title and Abstract

Title	Problem-based science learning in elementary schools: A bibliometric analysis
Abstract	This study aims to identify publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design in which descriptive, qualitative, and bibliometric analyses were used to look at the data. We selected the sample by using the purposive sampling technique. Secondary data contains Sinta-indexed research articles published in the Google Scholar database. Data were analyzed using content analysis and the VOS-Viewer. The results of the analysis show that between 2017 and 2021, 98 articles have been published with the keywords [problem-based learning] and [IPA or science learning] in national and international journals with research settings in Indonesia. Most publications occurred in 2020. The keywords that appear the most in the published articles obtained are [problem-based learning], [learning outcomes], [critical thinking skills], and [science learning]. The keyword [ <i>Tri Hita Karana</i> ], or three causes of well-being, appears, but with weak nodes. These keywords appear in many publications whose research settings are in Bali because they are ethnoscience findings from that area. Weak nodes have several conjectures, namely that this theme has been researched to saturate or that research on this theme is still rarely carried out. This research contributes ideas for future research involving the theme of problem-based learning in science.

### ABSTRACT

The present study identified publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design, where the data were analyzed using descriptive and bibliometric analysis. We selected the sample using the purposive sample technique. The secondary data contained SINTA-indexed research articles published in the Google Scholar database. The data were analyzed using Mendeley and VOS Viewer. The analysis showed that, between 2017 and 2021, 98 articles were published in national and international journals on problem-based science learning in elementary school. Based on the analysis, further research is needed on the theme "Tri Hita Karana." Meanwhile, some items had weak node visualization, indicating that previous studies have extensively explored the research topics. A faint or weak visualization on VOSviewer suggests that the topic may be reaching its saturation point.

## 1. INTRODUCTION

Education is the process of acquiring scientific skills. It provides each individual with academic knowledge, social skills, the ability to explore one's potential, and the ability to use technology [1]. Educators and students have a mutually beneficial relationship in an educational institution. The method of teaching knowledge can be complicated at times in order to attain learning objectives [2]. The role of education in creating a quality generation is inextricably linked to the quality of learning [3]. Learning contributes to the development of pupils' potential, personality, intelligence, and character [4]. Learning is a two-way interaction in which the teacher offers material, and the students receive the material being taught [5]. Learning can also be viewed as a stage in which the learning environment is regulated and conditioned to promote student character [6].

Learning is help given to pupils by educators to ensure that the process of acquiring knowledge goes smoothly [7]. An effective learning process positively impacts students' abilities and personalities. Learning builds students' strong characters, allowing them to assimilate into their social surroundings. Learning activities are deemed effective when designed according to the student's performance level [8]. Elementary school students receive learning that underpins the delivery of knowledge [8][9][10]. Learning at the elementary school level must focus on student qualities [4], especially being energetic and curious [11].

Elementary school students enjoy learning that includes games. Learning while playing helps children learn and absorb information more enjoyably and effectively. Elementary school students think in concrete and logical ways; thus, they understand things realistically [12]. Elementary school students learn by gaining knowledge

through hands-on activities [13]. Pupils in elementary school have excellent observational abilities, so educators must be able to design learning that support the development of students' observational skills.

Schools play a significant role in shaping students' character and personalities [14]. A student character created during the learning process represents a school system. The role of the teacher in the learning process cannot be isolated from the quality of an education system [3]. The learning process is strongly dependent on the learning model used by the teacher in the classroom [15]. A learning model should depict a systematic method to assist students in achieving the learning objectives [16]. It refers to a method, strategy, model, or technique for facilitating communication in the classroom [15]. Teachers should develop the learning model in such a way as to help students achieve the previously established learning objectives [17]. Experts have created many learning models based on learning principles, psychological theory, sociological theory, and supporting system analysis [18], [19]. A learning model approaches the learning process to promote students' active participation, attitudes, and knowledge.

Learning models aim to facilitate the delivery of learning materials and realize predetermined learning strategies [18]. Besides optimizing learning outcomes, learning models can also provide teachers and students with a broad picture of learning philosophy [20]. Optimizing the learning model's implementation will increase students' motivation to achieve higher learning outcomes [21]. It should be noted that the learning model used in class must be designed with the nature and type of information to be taught in mind, so that the inter-factors that make it up function as a unified whole. The unity of this learning model will later impact how students perceive learning material and reach learning goals. In the learning process, many different types of learning models can be used [22]. However, a teacher must carefully select and implement the appropriate learning model to provide students with a positive learning experience [23].

Teachers must be able to choose learning concepts that stimulate students' critical thinking skills. Problem-Based Learning (PBL) is an example of a learning approach that is suitable for the concept. Problem-Based Learning is an instructional approach that uses everyday problems to train students' critical thinking skills [24] [25]. PBL allows students to investigate and evaluate the situations presented by the teacher [26]. The steps in the problem-based learning model involve providing students with problem orientation, arranging for students to conduct research, requiring students to conduct analysis independently and in groups, and motivating students to develop and present the outcomes of the analysis. At the final stage of PBL, the teacher and students analyze and draw conclusions based on the problem-solving results [27].

The teacher serves as the learning facilitator in Problem-Based Learning, allowing students to actively participate in the learning process [11]. Problem-based learning has been shown to improve students' knowledge [28] and comprehension of concepts or ideas [29]. PBL requires students to identify and solve problems [30]. This problem-solving process will sharpen students' critical, observational, active, and creative thinking abilities, allowing them to identify solutions to these problems. Problem-based learning includes activities that are quite similar to the concept of learning science. Learning science in elementary school, for example, teaches pupils how to solve issues and think critically and rationally.

Science education should enable students to apply scientific concepts to real-world problems [24] [31]. As a school subject, natural science teaches students how to interact with their surroundings [32]. Science education builds students' attitudes, nimble skills, far-reaching ideas, and problem-solving skills [33]. Science education must also be able to develop students' skills to solve problems with reasoning and analysis [31] [34]. Science learning involves experimental activities or observations of natural occurrences that assist students in developing a working knowledge of science [35]. Problem-based learning (PBL) integrated into science classes can engage students in active learning [36].

Education research will continue to establish new networks to discover new research breakthroughs. It is impossible to deny that education research is a rapidly developing subject of study. Many studies have been carried out to investigate the integration of the PBL model and the IPA technique. Researchers around the world have been studying the effectiveness of PBL in science education. As a result, we should investigate the literature on the topic under consideration. The literature in this section is meant to expand on findings related to a theme. Bibliometric analysis is one of the techniques of analysis that can be used in a literature review. Bibliometric analysis can be used to assess the productivity of writers, organizations, and cross-theme collaborations [37].

A bibliometric analysis contains bibliographic studies or scientific activities carried out by a researcher [38]. It refers to a method for determining the publishing trend of a variable using a statistical or mathematical methodology [39]. The bibliography collection is evaluated to create publication trend maps, which are movements in a phenomenon, to find out the most recent information. A bibliometric analysis employs a quantitative approach to examine publication patterns such as subjects, authors, citations, titles, and other factors [40]. The current study examined a collection of published articles to see if there were any trends in the related variables. The articles were sorted according to predefined criteria. The VosViewer program was used to process the data. The VosViewer displays were evaluated to discover the trends of the connected variables. The findings of this study will be useful to other scholars looking for literature or references on the integration of PBL and natural sciences in elementary schools [41].

## 2. METHOD

This study employed mixed methods, combining descriptive and bibliometric analysis. The research sample was determined using a purposive sampling technique. The secondary data sources for this study were the Google Scholar database, which includes papers published in national and international journals. The national journals that published these publications are accredited on a national level (Sinta 1–5). Meanwhile, the international journals that were reviewed must be indexed by Scopus. The articles were published between 2017 and 2022. This study examined 98 articles that were sorted using predetermined criteria. Data analysis was assisted by VOS-Viewer and Mendeley.

The data analysis consisted of several stages. First, we collected articles that contain topics that are in line with the research objective. Following that, we examined and sorted the articles based on the criteria that had been set before transforming the article format to RIS using Mendeley. The data in the RIS form was then processed using the VOS-viewer tool with the co-occurrence analysis type setting and full-count calculation method, resulting in a minimum of two keywords being displayed (a total of 22 keywords). The VOS-viewer visualization was analyzed to answer the research question. The results of data analysis on VOS-Viewer were network mapping images containing 22 networks and 7 clusters of research topics with different colors.

## 3. RESULTS AND DISCUSSION

### 3.1 The Development of Research on the Application of Problem-Based Science Learning in Elementary Schools

We first discovered 14,500 articles with the keywords "penerapan problem-based learning IPA di Sekolah Dasar" (the implementation of problem-based science learning in elementary schools). Then, the articles were sorted depending on the journals' accreditation. Articles from national journals indexed by Sinta 1–5 and international journals indexed by Scopus were used in this study. In this investigation, 98 publications met the criterion for journal accreditation. Figure 1 depicts the rise in the number of research papers published on problem-based science learning in elementary schools from 2017 to 2020. However, the number of publications on this topic decreased significantly between 2018 and 2019.

Figure 1. Number of Research Publications on the Implementation of Problem-Based Science Learning in Elementary Schools in 2017-2021

Every year between 2017 and 2021, a different number of articles about the implementation of problem-based science learning in elementary schools were published. The year with the most publications (24 publications) was 2020, while the year with the fewest publications (16 publications) was 2019. In 2017, eighteen articles on PBL Science in primary schools were published in national and international journals, followed by 19 in 2021 and 21 in 2021. The data reveals that the number of publications on the implementation of PBL science in elementary schools has fluctuated between 2017 and 2021. The quantity of this publication can serve as an indicator of the current year's research trends [42], [43].

### 3.2 Specifications of National and International Journals Publishing Articles on the Implementation of Problem-Based Science Learning in Elementary Schools

This analysis employed articles from national journals indexed by Sinta 1, Sinta 2, Sinta 3, Sinta 4, and Sinta 5 and international journals indexed by Scopus. In this investigation, 98 articles from the Google Scholar database met the journal accreditation criteria. Researchers in Indonesia use the Scopus and Sinta indexes to measure different things [42], [44]. While Scopus is a global index that covers a wide range of disciplines and journals, Sinta is focused solely on research output in Indonesia [45]. Researchers in Indonesia may use both indexes to measure different aspects of their research performance, depending on their goals and the audience they are targeting.

### 3.2.1 Number of Articles Published in National Sinta-Indexed Journals

Among the ninety-eight articles used in the data analysis, 92 articles were published by national journals indexed by Sinta 1–5. Figure 2 presents a data visualization of the number of articles published in national journals on the application of problem-based science learning in elementary schools.

Figure 2. Number of Articles on the Implementation of Problem-Based Science Learning in Elementary Schools published in national journals between 2017 and 2021

The highest number of publications (23 articles) was found in 2020, followed by 20 publications in 2021. Meanwhile, the lowest number of publications (15 articles) was observed in 2019, 18 articles were published in 2018, and 17 articles were published in 2017. The high number of publications can be attributed to pandemic-era research trends, such as online learning. This remote, online learning approach is very suitable for the problem-based learning model [46], [47]. During the pandemic, there has been a huge rise in the use of online learning platforms and technologies, and many researchers have been looking at how well these methods work for implementing PBL in remote settings. Because, there are now a lot more research papers about PBL and online learning. Overall, the pandemic has given researchers and teachers a chance to try out new ways to teach and learn, and online learning has become a big part of this change [48]. As the pandemic continues, it is likely that research in this area will continue to grow as educators and researchers seek to improve the effectiveness of remote learning approaches and address the challenges posed by this new educational landscape.

### 3.2.2 Number of Articles Published in International Scopus-Indexed Journals

Figure 3 displays the number of articles on the implementation of problem-based science learning in elementary schools published in international Scopus-indexed journals.

Figure 3. Number of Articles on the Implementation of Problem-Based Science Learning in Elementary Schools published in international journals between 2017 and 2021.

Figure 3 indicates that six articles were published in international journals between 2017 and 2021. The highest number of articles (2 articles) published in the journals was found in 2017. From 2018 to 2021, one article was published every year.

### 3.3 Trends in Research on Problem-Based Science Learning in Elementary Schools on VOS-viewers

The VOS-Viewers application was used to analyze trends in research on the use of problem-based science learning in elementary schools from 2017 to 2021. Articles chosen based on journal accreditation were then imported into the Mendeley application and saved in the RIS format. Using VOS-Viewer, the obtained data were processed by configuring the co-occurrence computation of complete counting and units of analysis with keywords [49]. This form of analysis can be used to detect patterns and relationships between keywords or terms in a dataset, thereby assisting academics in identifying interesting study themes and areas. By displaying the co-occurrence network, researchers may determine which terms are most closely related and how they are interconnected within the network.

The analysis resulted in 138 keywords in 98 articles on related themes. However, after limiting the number of occurrences to two, we obtained twenty-three keywords. The data visualization was separated into some clusters, and each cluster was assigned a distinct color. Each cluster contains similar terms or subjects, as well as keywords that stand out in the set of articles that have been shown.

Figure 4. VOS-viewers Visualization on Trends in Research on PBL Science in Elementary Schools from 2017 to 2021

Nodes are the keywords that appear in the VOS-viewer visualization. To read the existing node network, each cluster is represented by a different color. Cluster 1 includes red nodes, Cluster 2 includes green nodes, Cluster 3 includes dark blue nodes, Cluster 4 includes yellow nodes, Cluster 5 includes purple nodes, Cluster 6 includes light blue nodes, and Cluster 7 includes orange nodes.

Table 1. Items contained in the VOS-viewer Visualization Clusters

Num	Cluster	Items dan Occurrences
1.	Cluster 1 (red node)	science learning outcomes (19), critical thinking skills (8), Problem-Based Learning (56), e-module development (2)
2.	Cluster 2 (green node)	learning outcomes (13), science (2), PBL (2), Tri Hita Karana (2)
3.	Cluster 3 (dark blue node)	science process skills (3), Problem-Based Learning model (15), learning achievement (2)
4.	Cluster 4 (yellow node)	human muscle disorder (2), science learning (10), problem solving (3)
5.	Cluster 5 (purple node)	critical thinking skills (5), science process skills (2), mastery of science concepts (3)
6.	Cluster 6 (light blue node)	critical thinking (3), problem solving (2), elementary school (3)
7.	Cluster 7 (orange node)	audio visual (3), learning motivation (3)

The VOS-viewer visualization data is reflected in the "Problem-based Learning" item, which is linked to other items. In other words, the items associated with the "problem-based learning" item have the highest level of correlation with other terms. *Occurrences* demonstrate how a node is linked to other nodes, whereas strength represents the link's strength, which is estimated based on its existence in the selected article. Based on our findings, we believe that the nodes that appear in a light color are nodes that are infrequently used as research topics. Nodes with faint hues and located far from the dominating node, on the other hand, are frequently used in research, resulting in saturated study subjects. This possibility exists because there is no guarantee in VOS-viewer that the nodes placed at the edge of the image are the nodes that are rarely used for whatever reason. As a result, researchers must be able to assess data based on factual data in the field in order to provide recommendations for study trends that are relevant to the needs of researchers and have the potential to be investigated in the future.

Figure 5. The Overlay Visualization of the keywords “*penerapan Problem-based Learning IPA di Sekolah Dasar*” (The implementation of Problem-Based Science Learning in Elementary Schools)

The overlay visualization shows that the "Tri Hita Karana" node is associated with the "Problem-based Learning" item with two occurrences and three total strengths. The findings of occurrences and strengths indicate that "Tri Hita Karana" is one of the items developed in earlier years of research. However, according to Google Scholar statistics, which include 6,000 publications, the topic has received little attention in the past five years. Thus, we recommend the item "Tri Hita Karana" as a research theme for future investigation. The term "Tri Hita Karana" refers to a science learning process that can promote students' behavior to appreciate nature and all living things.

Figure 6. The Overlay Visualization of Tri Hita Karana

Metadata and the VOS viewer show trends in research on the application of problem-based science learning in elementary schools from 2017 to 2021. The analysis results suggest research topics or items that can be developed further by future researchers. "Tri Hita Karana" is one of the items indicated by the study's findings. The term "Tri Hita Karana" refers to a science learning approach that helps shape students' positive attitudes toward nature, including respect for nature and all of its inhabitants. "Tri Hita Karana" is an educational concept developed based on the local wisdom in Bali. This philosophy teaches mankind to live in harmony with God, their fellow humans, including themselves, and everything around them, including the environment. However, the visualization findings suggest that "science process skills," "problem solving," "human muscle disorders," and "e-module creation" have the potential to be further developed due to their low occurrence rates.

#### 4. CONCLUSION

The analysis showed that, between 2017 and 2021, 98 articles on problem-based science learning were published in national and international journals. The highest number of articles related to this topic (23 publications) were published in 2020. The number of publications with the keywords "penerapan problem-based learning" (the implementation of problem-based science learning in elementary schools) fluctuated every year between 2017 and 2021, but the fluctuation did not occur significantly.

The keywords that appear the most in the published articles analyzed in this study are problem-based learning, learning outcomes, critical thinking skills, and science learning. A VOS-viewer metadata analysis on the keywords "penerapan problem-based learning IPA di Sekolah Dasar" (the implementation of problem-based science learning in elementary schools) suggests "Tri Hita Karana" as a research subject that should be investigated further. Tri Hita Karana refers to a science-based learning approach that helps instill in students a positive attitude towards nature, including respect for nature and all of its inhabitants. Tri Hita Karana is an educational concept developed based on local wisdom in Bali. This philosophy teaches humankind to live in harmony with God, those around them, including themselves, and everything around them, including the environment.

#### BIOGRAPHIES OF AUTHORS

	<p><b>Anenggar Dewi Puspita</b> is currently studying at the Department of Elementary School Teacher Education, Faculty of Teacher Training and Educational Sciences, Universitas Ahmad Dahlan. Her research interests include science education, development of science educational tools, and learning interests. She can be reached at <a href="mailto:anenggar1800005160@webmail.uad.ac.id">anenggar1800005160@webmail.uad.ac.id</a></p>
	<p><b>Dr. Ika Maryani, M.Pd</b>     is a faculty member at the Department of Elementary Teacher Education, Faculty of Teacher Training and Educational Sciences, Universitas Ahmad Dahlan. She has been actively involved in basic education research, particularly that focuses on enhancing teacher competency and improving students' learning experience. She graduated from Universitas Sebelas Maret with a bachelor's degree in Chemistry Education and a master's degree in Science Education. She earned her doctorate in Education from Universitas Negeri Yogyakarta.</p>

## Editor/Author Correspondence

Editor 2023-03-15 05:46 PM Subject: [EduLearn] Decision "PROBLEM-BASED SCIENCE LEARNING IN ELEMENTARY SCHOOLS: A BIBLIOMETRIC ANALYSIS" [DELETE](#)

---

- Paper ID# 20856
  - Number of minimum references is 25 primarily journal articles published in the last five years
  - The references must be presented in numbering and CITATION ORDER (in the body paper) is SEQUENTIAL [1], [2], [3], [4], .....
  - Guide of authors and Template: <http://iaescore.com/gfa/edulearn.docx>
- =====

Dear Prof./Dr./Mr./Mrs.: Ika Maryani,

It is my pleasure to notify you that your paper entitled "PROBLEM-BASED SCIENCE LEARNING IN ELEMENTARY SCHOOLS: A BIBLIOMETRIC ANALYSIS" may be accepted with minor adjustments in the Journal of Education and Learning (EduLearn), if your revision is appropriate. Authors are advised to carefully evaluate the reviewers' comments and suggestions for manuscript development, and to rigorously adhere to the authors' guidance (<http://iaescore.com/gfa/edulearn.docx>). This journal is ACCREDITED (recognised) by the Ministry of Education, Culture, Research, and Technology, Republic of Indonesia (Decree No: 5162/E4/AK.04/2021), INDEXED by the ERIC Institute of Education Sciences (IES) of the U.S. Department of Education, and has just been accepted for inclusion in Scopus (<https://suggestor.step.scopus.com/progressTracker/?trackingID=4F4DD39B4F318CE6>).

- Please adhere to these rules to guarantee that your work is full and formatted correctly.
- Only high-quality manuscripts are published in this journal. A high-quality paper MUST include the following features: 1) a clear presentation of the topic addressed by the study; 2) the proposed idea(s)/solution(s); and 3) the findings obtained. It clearly summarizes what has previously been done on the subject, as well as what is NEW. Your updated paper should describe NOVEL TECHNICAL RESULTS.
  - Make certain that your conversation section is appropriate. The "results and discussion" section summarizes the most important findings, including any relevant results analysis.
  - The title describes the key notion or ideas of your study (the title is your paper's "summary" and "essence"). The title should be both "inclusive" and "descriptive." A excellent title uses as few words as possible to accurately convey the content and/or aim of your research paper. Use abbreviations and acronyms sparingly unless they are widely recognized.

Please try to arrange your paper; the audiences of this journal are not only Indonesian authors but also international audiences. The findings should benefit international audiences.

Submit your updated paper through our online system as author version (but if you reach any problems, you can submit your updated paper to email: [EduLearn@uad.ac.id](mailto:EduLearn@uad.ac.id) cc: [EduLearn@journal.uad.ac.id](mailto:EduLearn@journal.uad.ac.id)) within 6 weeks

Your cooperation is very appreciated

Best Regards,  
Lina Handayani  
Managing Editor  
[edulearn@uad.ac.id](mailto:edulearn@uad.ac.id)

-----  
 ##### - IMPORTANT - #####  
 -----

- For an original research paper, there are four (4) sorts of innovative technical outcomes: 1) An method/technique/approach/framework/...; 2) A system construct, such as a hardware design, software system, protocol, and so on; The major purpose of your rewritten article is to guarantee that the next individual who builds a system similar to yours does not make the same mistakes and takes benefit of some of your better ideas. So make certain that the difficult problems (and their answers) are covered, as well as the non-obvious mistakes (and how to prevent them). 3) A performance evaluation: acquired by analysis, simulation, or measurements; or 4) A theory: a set of theorems. Your updated paper should emphasize: 1) Describing the results in sufficient detail to verify their validity; 2) Identifying the innovative parts of the results, i.e., what new information is revealed and what makes it non-obvious; and 3) Identifying the relevance of the results: what improvements and effect do they imply. A minimum of 25 references are required for an original research work (included 20 recent journal articles).

- For review paper, there should be a critical, constructive review of the literature in a certain topic via summary, categorization, analysis and comparison in this work. The purpose of a review article is one of five things: 1) to arrange literature; 2) to assess literature; 3) to find patterns and trends in literature; 4) to synthesize literature; or 5) to identify research gaps and offer new areas of investigation. The structure includes:

1. Title – in this case does not indicate that it is a review article.
2. Abstract – includes a description of subjects covered.
3. Introduction includes a description of context (paragraph 1–3), motivation for review (paragraph 4, sentence #1) and defines the focus (paragraph 4, sentences #2–3)
4. Body – structured by headings and subheadings
5. Conclusion – states the implications of the findings and an identifies possible new research fields
6. References ("Literature Review") – organised by number in the order they were cited in the text.

Number of minimum references for review paper is 50 references (and minimum 40 recently journal articles).

-----

- Abstract: Prepare your abstract in one paragraph of no more than 200 words. You must summarize your contribution, hypothesis, findings/results, and discuss the consequences of your findings. There are no abbreviations, footnotes, or references. Without the use of mathematical equations, graphs, or tabular data. It is recommended that you offer your abstract using the following elements: 1) state the primary goal of the paper; 2) highlight the merits (or contribution; 3) provide a conceptual idea on the method; 4) describe the research design and procedures/processes used (is it simulation, experimental, survey, etc.); 5) provide the main outcomes or results, as well as any conclusions that may be drawn; and 6) include any implications for further research or application/practice, if any.

-----

The following criteria should be carefully considered in your updated paper:

1. Analysis: Your rewritten article should exhibit a thorough comprehension of the major problems surrounding your chosen topic. The article should demonstrate analysis rather than a simple overview of the issue under examination. It should also offer proof to back its arguments if needed.
  2. Connections: Throughout the research, your work should illustrate a relationship between the sources you include and the major issue.
  3. Mechanics: This involves paying attention to punctuation, grammar, and spelling mistakes in your contributions.
  4. Formatting: Follow the updated author's guide (<http://iaescore.com/gfa/edulearn.docx>).
- 
- 

The following template should be used for responses to reviewers:

I would like to thank the reviewers for their insightful feedback. All comments from Reviewer 1 are highlighted in yellow, those from Reviewer 2 are highlighted in red, and those from Reviewer 3 are highlighted in green.

Reviewer 1

Comment 1: There are some references that are not required.

Response: We thoroughly updated our references; 5 references were eliminated, and two were replaced by more recent publications.

Comment 2: The presentation of Figures 2 and 3 should be improved.

Response: The necessary adjustments have been made.

Comment 3: Equation (2) seems to be incorrect.

Response: Equation (2) is correct. This can be proven as follows:...

In order to clarify equation 9 in the manuscript, the following remarks have been added... etc.

All changes for reviewer 1 are highlighted in yellow in the main text.

Reviewer 2

Comment 1:

Response:

Comment 2:

Response:

Comment 3:

Response:

All changes for reviewer 2 are highlighted in red in the main text.

Etc.

Such a document clarifies everything and will aid the reviewers in evaluating the work fast. When providing your amended primary document files, you must also upload your corrections statement. Before your manuscript, the declaration of revisions should appear.

-----

Reviewer D:

Does the title of the paper accurately reflect the major focus contribution of this paper?:

Yes

If No, Please suggest change of the title as appropriate:

Is the abstract an appropriate and adequate digest of the work?:

Yes

If No, Please suggest change of the abstract as appropriate::

Is the paper clear, concise, and well organized?:

Yes

If No, Please suggest change of the organizing as appropriate::

Rate of the contribution strength to the field is represented in this paper?:

Good

Rate the scientific quality of the paper?:

Average

Do authors place the paper in proper context by citing relevant papers?:

Yes

Is the paper free from obvious errors, misconceptions, or ambiguity?:

Yes

Is the paper written in correct English?:

Yes

If No, please note grammatical errors and suggest corrections::

Are the references in EduLearn style?:

Yes

Are the figures and tables in EduLearn style, clear, relevant, and are the captions adequate?:

Yes

Is the length of the paper adequate?:

Yes

Please mark appropriate scale for the overall grade for this paper? (A score of 7 of 10 or above typically provides ground for EduLearn acceptance):

8

OTHER Reviewer's comments and suggestions to improve the paper. (If it is not possible, kindly please use separate sheets or a copy of the paper for comments and suggestions for revision. Indicate whether revisions are mandatory or suggested. Please use word processing type format if possible, and then upload in this system or submit via email to EduLearn@journal.uad.ac.id):

Reviewer E:

Does the title of the paper accurately reflect the major focus contribution of this paper?:

Yes

If No, Please suggest change of the title as appropriate:

Is the abstract an appropriate and adequate digest of the work?:

Yes

If No, Please suggest change of the abstract as appropriate::

Instead of using the word 'we', you can use the author/s or the research

Is the paper clear, concise, and well organized?:

Yes

If No, Please suggest change of the organizing as appropriate::

Therefore, here are some notes:

- Ensure all the table/figure is stated first in the body text before showing it
- Remake figures 1-3, to me, the figures are not really neat
- Too many local references, kindly replace some of them with international sources

Rate of the contribution strength to the field is represented in this paper?:

Good

Rate the scientific quality of the paper?:

Average

Do authors place the paper in proper context by citing relevant papers?:

Yes

Is the paper free from obvious errors, misconceptions, or ambiguity?:

No

Is the paper written in correct English?:

Yes

If No, please note grammatical errors and suggest corrections::

Are the references in EduLearn style?:

Yes

Are the figures and tables in EduLearn style, clear, relevant, and are the captions adequate?:

Yes

Is the length of the paper adequate?:

Yes

Please mark appropriate scale for the overall grade for this paper? (A score of 7 of 10 or above typically provides ground for EduLearn acceptance):

6

OTHER Reviewer's comments and suggestions to improve the paper. (If it is not possible, kindly please use separate sheets or a copy of the paper for comments and suggestions for revision. Editor Subject: [EduLearn] Decision - SCOPUS indexed Journal of Education and Learning (EduLearn) [DELETE](#)

2023-03-29 10:36 AM

-- Paper ID#  
 -- Number of minimum references is 30 primarily journal articles published in the last five years  
 - Ref. in Bahasa must be translated into English in the bracket

Dear Prof./Dr./Mr./Mrs. Ika Maryani,

It is my great pleasure to inform you that your paper entitled "PROBLEM-BASED SCIENCE LEARNING IN ELEMENTARY SCHOOLS: A BIBLIOMETRIC ANALYSIS" has been conditionally ACCEPTED and will be published in the Journal of Education and Learning (EduLearn). This journal is ACCREDITED (recognised) by the Ministry of Education, Culture, Research, and Technology, Republic of Indonesia (Decree No: 5162/E4/AK.04/2021), INDEXED by the ERIC Institute of Education Sciences (IES) of the U.S. Department of Education, and has just been accepted for inclusion in Scopus (<https://suggestor.step.scopus.com/progressTracker/?trackingID=4F4DD39B4F318CE6>). Congratulations!

Your paper is in the final stage for publication, but revisions are required. Please try to arrange your paper; the audiences of this journal are not only Indonesian authors but also international audiences. The findings should benefit international audiences. Authors are encouraged to carefully consider the reviewers comments and suggestions for improvement of their manuscript. Authors should write "research grant or contract" in the acknowledgement section.

Pay attention also to the following instructions carefully!

1). PLEASE ADHERE STRICTLY THE GUIDE OF AUTHORS !! <http://iaescore.com/gfa/edulearn.docx> and pay attention to the checklist for preparing your FINAL paper for publication: <http://edulearn.intelektual.org/index.php/EduLearn/about/editorialPolicies#custom-5>

2). All articles must follow the IMRAD plus C structure: 1. INTRODUCTION - 2. The Advanced Theory/Proposed Method/Framework/... specifically designed/proposed (optional) - 3. METHOD - 4. RESULTS AND DISCUSSION - 5. CONCLUSION (all included and clearly printed). See <http://iaescore.com/gfa/edulearn.docx>

3). Add biographies of authors as our template (include links to all authors' profiles, do not delete any icons in the template). It is mandatory!! See <http://iaescore.com/gfa/edulearn.docx>  
--> Provide links for all authors to the 4 icons (Scholar, Scopus, Publons and ORCID)

4). Prepare all tables as our template (NOT as figure)

5). Use different PATTERNS for presenting different results in your figures/graphics (instead of different colors). It is mandatory!! Re-check all your figures. See <http://iaescore.com/gfa/edulearn.docx>

6). Please ensure that all references have been cited in your text. Use a tool such as EndNote, Mendeley, or Zotero for reference management and formatting, and choose IEEE style. Each citation should be written in the order of appearance in the text in square brackets. For example, the first citation [1], the second citation [2], and the third and fourth citations [3], [4]. When citing multiple sources at once, the preferred method is to list each number separately, in its own brackets, using a comma or dash between numbers, as such: [1], [3], [5]. It is not necessary to mention an author's name, pages used, or date of publication in the in-text citation. Instead, refer to the source with a number in a square bracket, e.g. [9], that will then correspond to the full citation in your reference list. Examples of in-text citations:  
This theory was first put forward in 1970 [9].  
Zadeh [10] has argued that ...  
Several recent studies [7], [9], [11]-[15] have suggested that...  
... end of the line for my research [16].

7). Please present all references as complete as possible and use IEEE style (include information of DOIs, volume, number, pages, etc). If it is available, DOI information is mandatory!! See <http://iaescore.com/gfa/edulearn.docx>

Please prepare your final paper by doing your best to avoid any delay for publication !!! Please do it seriously !!!

Submit final paper along with your similarity report and your payment evidence to email: [EduLearn@uad.ac.id](mailto:EduLearn@uad.ac.id) cc: [EduLearn@journal.uad.ac.id](mailto:EduLearn@journal.uad.ac.id) within 4 weeks. The similarity rate should be checked by using software such as iThenticate or Turnitin (that the result is below 25%). If the similarity index is more than 25%, your paper will be rescheduled for publication until the similarity is less than 25%.

We really appreciate your total commitment to supporting this journal.

Your cooperation is very appreciated

Best Regards,  
Dr. Lina Handayani

-----  
-----  
----- ##### - IMPORTANT - ##### -----  
-----  
-----

Abstract: Prepare your abstract in a single paragraph and within 200 words. You need to summarize your contributions, ideas, findings or results and describe the implications of the findings (without abbreviations, footnotes, or references without mathematical equations, diagrams, or tabular materials). It is recommended that you present your abstract with the following elements:

- 1) State the primary goal of the paper;
- 2) extol the virtues (or contribution);
- 3) describe the method conceptually;
- 4) Describe the research design and procedures/processes used (is it simulation, experimental, or survey, for example);
- 5) Provide the main outcomes or results, as well as any conclusions that may be drawn;
- 6) If applicable, include any implications for future research or application/practice.

This journal ONLY publishes high-quality papers. A high-quality paper should include the following components: 1) a clear statement of the problem addressed in the paper; 2) the proposed solution(s); and 3) the obtained results It clearly describes previous work on the problem as well as what is new.

Make sure that your discussion section is suitable. In the "Results and Discussion" section, the most important findings are listed, along with any necessary analysis of the results.

The title summarizes the main idea or ideas of your study (the title is the "summary" and "essence" of your paper). The title should be "encompassing" as well as "descriptive". A good title contains the fewest possible words needed to adequately describe the content and/or purpose of your research paper. Use abbreviations or acronyms rarely unless they are commonly known.

-----  
-----

...: Camera ready paper ::..

Your final camera ready paper should reflect a careful consideration of the following criteria:

1. Analysis: your revised paper should demonstrate a clear understanding of the key issues related to your topic of choice. The paper should display analysis and not a mere summary of the topic under consideration. It should also include evidence to back up arguments where necessary.

2. Connections: your paper should demonstrate a connection between the references you mention to the central topic and to each other where necessary throughout the paper.
3. Mechanics: this includes attention to punctuation, grammatical soundness, and your submissions' being checked for spelling errors.
4. Formatting: follow the new author's guide (<http://iaescore.com/gfa/edulearn.docx>).

To support the cost of wide open access dissemination of research results, to manage the various costs associated with handling and editing of the submitted manuscripts, and the journal management and publication in general, the authors or the author's institution is requested to pay a publication and layout fee.

Local (INDONESIA Authors): IDR 2500K  
Overseas (International Authors): USD 165  
The above fee covers the standard eight (8) pages manuscript.  
For every additional page an extra fee of USD 40 (~IDR 560K) per page will be charged.

The payment should be made by bank transfer (T/T):

-----  
Bank Account name/Beneficiary (please be exact): TOLE SUTIKNO  
Bank Name: Bank Syariah Indonesia (PT Bank Syariah Indonesia Tbk)

Subject: [EduLearn] Decision - SCOPUS indexed Journal of Education and Learning (EduLearn)

[DELETE](#)

-- Paper ID# 20856

-- Number of minimum references is 25 primarily journal articles published in the last five years  
-----  
-----

Dear Prof./Dr./Mr./Mrs. Ika Maryani,

It is my great pleasure to inform you that your paper entitled "PROBLEM-BASED SCIENCE LEARNING IN ELEMENTARY SCHOOLS: A BIBLIOMETRIC ANALYSIS" has been conditionally ACCEPTED and will be published in the Journal of Education and Learning (EduLearn). This journal is ACCREDITED (recognised) by the Ministry of Education, Culture, Research, and Technology, Republic of Indonesia (Decree No: 5162/E4/AK.04/2021), INDEXED by the ERIC Institute of Education Sciences (IES) of the U.S. Department of Education, and has just been accepted for inclusion in Scopus (<https://suggestor.step.scopus.com/progressTracker/?trackingID=4F4DD39B4F318CE6>). Congratulations!

Your paper is in the final stage for publication, but revisions are required. Figures 4-6 MUST be mentioned in your body text before appear.

Reference [24] is local and weak. Please use international journal articles as substitution. Please try to arrange your paper; the audiences of this journal are not only Indonesian authors but also international audiences. The findings should benefit international audiences. Authors are encouraged to carefully consider the reviewers comments and suggestions for improvement of their manuscript. Authors should write

"research grant or contract" in the acknowledgement section.

Pay attention also to the following instructions carefully!

1). PLEASE ADHERE STRICTLY THE GUIDE OF AUTHORS !! <http://iaescore.com/gfa/edulearn.docx> and pay attention to the checklist for preparing your FINAL paper for publication: <http://edulearn.intelektual.org/index.php/EduLearn/about/editorialPolicies#custom-5>

2). All articles must follow the IMRAD plus C structure: 1. INTRODUCTION - 2. The Advanced Theory/Proposed Method/Framework/... specifically designed/proposed (optional) - 3. METHOD - 4. RESULTS AND DISCUSSION - 5. CONCLUSION (all included and clearly printed). See <http://iaescore.com/gfa/edulearn.docx>

3). Add biographies of authors as our template (include links to all authors' profiles, do not delete any icons in the template). It is mandatory!! See <http://iaescore.com/gfa/edulearn.docx>  
--> Provide links for all authors to the 4 icons (Scholar, Scopus, Publons and ORCID)

4). Prepare all tables as our template (NOT as figure)

5). Use different PATTERNS for presenting different results in your figures/graphics (instead of different colors). It is mandatory!! Re-check all your figures. See <http://iaescore.com/gfa/edulearn.docx>

6). Please ensure that all references have been cited in your text. Use a tool such as EndNote, Mendeley, or Zotero for reference management and formatting, and choose IEEE style. Each citation should be written in the order of appearance in the text in square brackets. For example, the first citation [1], the second citation [2], and the third and fourth citations [3], [4]. When citing multiple sources at once, the preferred method is to list each number separately, in its own brackets, using a comma or dash between numbers, as such: [1], [3], [5]. It is not necessary to mention an author's name, pages used, or date of publication in the in-text citation. Instead, refer to the source with a number in a square bracket, e.g. [9], that will then correspond to the full citation in your reference list. Examples of in-text citations:  
This theory was first put forward in 1970 [9].  
Zadeh [10] has argued that ...  
Several recent studies [7], [9], [11]-[15] have suggested that....  
... end of the line for my research [16].

7). Please present all references as complete as possible and use IEEE style (include information of DOIs, volume, number, pages, etc). If it is available, DOI information is mandatory!! See <http://iaescore.com/gfa/edulearn.docx>

Please prepare your final paper by doing your best to avoid any delay for publication !!! Please do it seriously !!!

Submit final paper along with your similarity report and your payment evidence to email: [EduLearn@uad.ac.id](mailto:EduLearn@uad.ac.id) cc: [EduLearn@journal.uad.ac.id](mailto:EduLearn@journal.uad.ac.id) within 4 weeks. The similarity rate should be checked by using software such as iThenticate or Turnitin (that the result is below 25%). If the similarity index is more than 25%, your paper will be rescheduled for publication until the similarity is less than 25%.

We really appreciate your total commitment to supporting this journal.

Your cooperation is very appreciated

Best Regards,  
Lina Handayani  
Managing Editor  
[edulearn@uad.ac.id](mailto:edulearn@uad.ac.id)

##### - IMPORTANT - #####

Abstract: Prepare your abstract in a single paragraph and within 200 words. You need to summarize your contributions, ideas, findings or results and describe the implications of the findings (without abbreviations, footnotes, or references without mathematical equations, diagrams, or tabular materials). It is recommended that you present your abstract with the following elements:

- 1) State the primary goal of the paper;
- 2) extol the virtues (or contribution);
- 3) describe the method conceptually;
- 4) Describe the research design and procedures/processes used (is it simulation, experimental, or survey, for example);
- 5) Provide the main outcomes or results, as well as any conclusions that may be drawn;
- 6) If applicable, include any implications for future research or application/practice.

This journal ONLY publishes high-quality papers. A high-quality paper should include the following components: 1) a clear statement of the problem addressed in the paper; 2) the proposed solution(s); and 3) the obtained results It clearly describes previous work on the problem as well as what is new.

Make sure that your discussion section is suitable. In the "Results and Discussion" section, the most important findings are listed, along with any necessary analysis of the results.

The title summarizes the main idea or ideas of your study (the title is the "summary" and "essence" of your paper). The title should be "encompassing" as well as "descriptive". A good title contains the fewest possible words needed to adequately describe the content and/or purpose of your research paper. Use abbreviations or acronyms rarely unless they are commonly known.

---

---

...: Camera ready paper ...:

Your final camera ready paper should reflect a careful consideration of the following criteria:

1. Analysis: your revised paper should demonstrate a clear understanding of the key issues related to your topic of choice. The paper should display analysis and not a mere summary of the topic under consideration. It should also include evidence to back up arguments where necessary.
  2. Connections: your paper should demonstrate a connection between the references you mention to the central topic and to each other where necessary throughout the paper.
  3. Mechanics: this includes attention to punctuation, grammatical soundness, and your submissions' being checked for spelling errors.
  4. Formatting: follow the new author's guide (<http://iaescore.com/gfa/edulearn.docx>).
- 
- 

To support the cost of wide open access dissemination of research results, to manage the various costs associated with handling and editing of the submitted manuscripts, and the journal management and publication in general, the authors or the author's institution is requested to pay a publication and layout fee.

Local (INDONESIA Authors): IDR 2500K

Overseas (International Authors): USD 165

The above fee covers the standard eight (8) pages manuscript.

For every additional page an extra fee of USD 40 (~IDR 560K) per page will be charged.

The payment should be made by bank transfer (T/T):

### ABSTRACT

The present study identified publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design, where the data were analyzed using descriptive and bibliometric analysis. We selected the sample using the purposive sample technique. The secondary data contained SINTA-indexed research articles published in the Google Scholar database. The data were analyzed using Mendeley and VOS Viewer. The analysis showed that, between 2017 and 2021, 98 articles were published in national and international journals on problem-based science learning in elementary school. Based on the analysis, further research is needed on the theme "Tri Hita Karana." Meanwhile, some items had weak node visualization, indicating that previous studies have extensively explored the research topics. A faint or weak visualization on VOSviewer suggests that the topic may be reaching its saturation point.

## 1. INTRODUCTION

Education is the process of acquiring scientific skills. It provides each individual with academic knowledge, social skills, the ability to explore one's potential, and the ability to use technology [1]. Educators and students have a mutually beneficial relationship in an educational institution. The method of teaching knowledge can be complicated at times in order to attain learning objectives [2]. The role of education in creating a quality generation is inextricably linked to the quality of learning [3]. Learning contributes to the development of pupils' potential, personality, intelligence, and character [4]. Learning is a two-way interaction in which the teacher offers material, and the students receive the material being taught [5]. Learning can also be viewed as a stage in which the learning environment is regulated and conditioned to promote student character [6].

Learning is help given to pupils by educators to ensure that the process of acquiring knowledge goes smoothly [7]. An effective learning process positively impacts students' abilities and personalities. Learning builds students' strong characters, allowing them to assimilate into their social surroundings. Learning activities are deemed effective when designed according to the student's performance level [8]. Elementary school students receive learning that underpins the delivery of knowledge [8][9][10]. Learning at the elementary school level must focus on student qualities [4], especially being energetic and curious [11].

Elementary school students enjoy learning that includes games. Learning while playing helps children learn and absorb information more enjoyably and effectively. Elementary school students think in concrete and logical ways; thus, they understand things realistically [12]. Elementary school students learn by gaining knowledge

through hands-on activities [13]. Pupils in elementary school have excellent observational abilities, so educators must be able to design learning that support the development of students' observational skills.

Schools play a significant role in shaping students' character and personalities [14]. A student character created during the learning process represents a school system. The role of the teacher in the learning process cannot be isolated from the quality of an education system [3]. The learning process is strongly dependent on the learning model used by the teacher in the classroom [15]. A learning model should depict a systematic method to assist students in achieving the learning objectives [16]. It refers to a method, strategy, model, or technique for facilitating communication in the classroom [15]. Teachers should develop the learning model in such a way as to help students achieve the previously established learning objectives [17]. Experts have created many learning models based on learning principles, psychological theory, sociological theory, and supporting system analysis [18], [19]. A learning model approaches the learning process to promote students' active participation, attitudes, and knowledge.

Learning models aim to facilitate the delivery of learning materials and realize predetermined learning strategies [18]. Besides optimizing learning outcomes, learning models can also provide teachers and students with a broad picture of learning philosophy [20]. Optimizing the learning model's implementation will increase students' motivation to achieve higher learning outcomes [21]. It should be noted that the learning model used in class must be designed with the nature and type of information to be taught in mind, so that the inter-factors that make it up function as a unified whole. The unity of this learning model will later impact how students perceive learning material and reach learning goals. In the learning process, many different types of learning models can be used [22]. However, a teacher must carefully select and implement the appropriate learning model to provide students with a positive learning experience [23].

Teachers must be able to choose learning concepts that stimulate students' critical thinking skills. Problem-Based Learning (PBL) is an example of a learning approach that is suitable for the concept. Problem-Based Learning is an instructional approach that uses everyday problems to train students' critical thinking skills [24] [25]. PBL allows students to investigate and evaluate the situations presented by the teacher [26]. The steps in the problem-based learning model involve providing students with problem orientation, arranging for students to conduct research, requiring students to conduct analysis independently and in groups, and motivating students to develop and present the outcomes of the analysis. At the final stage of PBL, the teacher and students analyze and draw conclusions based on the problem-solving results [27].

The teacher serves as the learning facilitator in Problem-Based Learning, allowing students to actively participate in the learning process [11]. Problem-based learning has been shown to improve students' knowledge [28] and comprehension of concepts or ideas [29]. PBL requires students to identify and solve problems [30]. This problem-solving process will sharpen students' critical, observational, active, and creative thinking abilities, allowing them to identify solutions to these problems. Problem-based learning includes activities that are quite similar to the concept of learning science. Learning science in elementary school, for example, teaches pupils how to solve issues and think critically and rationally.

Science education should enable students to apply scientific concepts to real-world problems [24] [31]. As a school subject, natural science teaches students how to interact with their surroundings [32]. Science education builds students' attitudes, nimble skills, far-reaching ideas, and problem-solving skills [33]. Science education must also be able to develop students' skills to solve problems with reasoning and analysis [31] [34]. Science learning involves experimental activities or observations of natural occurrences that assist students in developing a working knowledge of science [35]. Problem-based learning (PBL) integrated into science classes can engage students in active learning [36].

Education research will continue to establish new networks to discover new research breakthroughs. It is impossible to deny that education research is a rapidly developing subject of study. Many studies have been carried out to investigate the integration of the PBL model and the IPA technique. Researchers around the world have been studying the effectiveness of PBL in science education. As a result, we should investigate the literature on the topic under consideration. The literature in this section is meant to expand on findings related to a theme. Bibliometric analysis is one of the techniques of analysis that can be used in a literature review. Bibliometric analysis can be used to assess the productivity of writers, organizations, and cross-theme collaborations [37].

A bibliometric analysis contains bibliographic studies or scientific activities carried out by a researcher [38]. It refers to a method for determining the publishing trend of a variable using a statistical or mathematical methodology [39]. The bibliography collection is evaluated to create publication trend maps, which are movements in a phenomenon, to find out the most recent information. A bibliometric analysis employs a quantitative approach to examine publication patterns such as subjects, authors, citations, titles, and other factors [40]. The current study examined a collection of published articles to see if there were any trends in the related variables. The articles were sorted according to predefined criteria. The VosViewer program was used to process the data. The VosViewer displays were evaluated to discover the trends of the connected variables. The findings of this study will be useful to other scholars looking for literature or references on the integration of PBL and natural sciences in elementary schools [41].

## 2. METHOD

This study employed mixed methods, combining descriptive and bibliometric analysis. The research sample was determined using a purposive sampling technique. The secondary data sources for this study were the Google Scholar database, which includes papers published in national and international journals. The national journals that published these publications are accredited on a national level (Sinta 1–5). Meanwhile, the international journals that were reviewed must be indexed by Scopus. The articles were published between 2017 and 2022. This study examined 98 articles that were sorted using predetermined criteria. Data analysis was assisted by VOS-Viewer and Mendeley.

The data analysis consisted of several stages. First, we collected articles that contain topics that are in line with the research objective. Following that, we examined and sorted the articles based on the criteria that had been set before transforming the article format to RIS using Mendeley. The data in the RIS form was then processed using the VOS-viewer tool with the co-occurrence analysis type setting and full-count calculation method, resulting in a minimum of two keywords being displayed (a total of 22 keywords). The VOS-viewer visualization was analyzed to answer the research question. The results of data analysis on VOS-Viewer were network mapping images containing 22 networks and 7 clusters of research topics with different colors.

## 3. RESULTS AND DISCUSSION

### 3.1 The Development of Research on the Application of Problem-Based Science Learning in Elementary Schools

We first discovered 14,500 articles with the keywords "penerapan problem-based learning IPA di Sekolah Dasar" (the implementation of problem-based science learning in elementary schools). Then, the articles were sorted depending on the journals' accreditation. Articles from national journals indexed by Sinta 1–5 and international journals indexed by Scopus were used in this study. In this investigation, 98 publications met the criterion for journal accreditation. Figure 1 depicts the rise in the number of research papers published on problem-based science learning in elementary schools from 2017 to 2020. However, the number of publications on this topic decreased significantly between 2018 and 2019.

Figure 1. Number of Research Publications on the Implementation of Problem-Based Science Learning in Elementary Schools in 2017-2021

Every year between 2017 and 2021, a different number of articles about the implementation of problem-based science learning in elementary schools were published. The year with the most publications (24 publications) was 2020, while the year with the fewest publications (16 publications) was 2019. In 2017, eighteen articles on PBL Science in primary schools were published in national and international journals, followed by 19 in 2021 and 21 in 2021. The data reveals that the number of publications on the implementation of PBL science in elementary schools has fluctuated between 2017 and 2021. The quantity of this publication can serve as an indicator of the current year's research trends [42], [43].

### 3.2 Specifications of National and International Journals Publishing Articles on the Implementation of Problem-Based Science Learning in Elementary Schools

This analysis employed articles from national journals indexed by Sinta 1, Sinta 2, Sinta 3, Sinta 4, and Sinta 5 and international journals indexed by Scopus. In this investigation, 98 articles from the Google Scholar database met the journal accreditation criteria. Researchers in Indonesia use the Scopus and Sinta indexes to measure different things [42], [44]. While Scopus is a global index that covers a wide range of disciplines and journals, Sinta is focused solely on research output in Indonesia [45]. Researchers in Indonesia may use both indexes to measure different aspects of their research performance, depending on their goals and the audience they are targeting.

### 3.2.1 Number of Articles Published in National Sinta-Indexed Journals

Among the ninety-eight articles used in the data analysis, 92 articles were published by national journals indexed by Sinta 1–5. Figure 2 presents a data visualization of the number of articles published in national journals on the application of problem-based science learning in elementary schools.

Figure 2. Number of Articles on the Implementation of Problem-Based Science Learning in Elementary Schools published in national journals between 2017 and 2021

The highest number of publications (23 articles) was found in 2020, followed by 20 publications in 2021. Meanwhile, the lowest number of publications (15 articles) was observed in 2019, 18 articles were published in 2018, and 17 articles were published in 2017. The high number of publications can be attributed to pandemic-era research trends, such as online learning. This remote, online learning approach is very suitable for the problem-based learning model [46], [47]. During the pandemic, there has been a huge rise in the use of online learning platforms and technologies, and many researchers have been looking at how well these methods work for implementing PBL in remote settings. Because, there are now a lot more research papers about PBL and online learning. Overall, the pandemic has given researchers and teachers a chance to try out new ways to teach and learn, and online learning has become a big part of this change [48]. As the pandemic continues, it is likely that research in this area will continue to grow as educators and researchers seek to improve the effectiveness of remote learning approaches and address the challenges posed by this new educational landscape.

### 3.2.2 Number of Articles Published in International Scopus-Indexed Journals

Figure 3 displays the number of articles on the implementation of problem-based science learning in elementary schools published in international Scopus-indexed journals.

Figure 3. Number of Articles on the Implementation of Problem-Based Science Learning in Elementary Schools published in international journals between 2017 and 2021.

Figure 3 indicates that six articles were published in international journals between 2017 and 2021. The highest number of articles (2 articles) published in the journals was found in 2017. From 2018 to 2021, one article was published every year.

### 3.3 Trends in Research on Problem-Based Science Learning in Elementary Schools on VOS-viewers

The VOS-Viewers application was used to analyze trends in research on the use of problem-based science learning in elementary schools from 2017 to 2021. Articles chosen based on journal accreditation were then imported into the Mendeley application and saved in the RIS format. Using VOS-Viewer, the obtained data were processed by configuring the co-occurrence computation of complete counting and units of analysis with keywords [49]. This form of analysis can be used to detect patterns and relationships between keywords or terms in a dataset, thereby assisting academics in identifying interesting study themes and areas. By displaying the co-occurrence network, researchers may determine which terms are most closely related and how they are interconnected within the network.

The analysis resulted in 138 keywords in 98 articles on related themes. However, after limiting the number of occurrences to two, we obtained twenty-three keywords. The data visualization was separated into some clusters, and each cluster was assigned a distinct color. Each cluster contains similar terms or subjects, as well as keywords that stand out in the set of articles that have been shown.

Figure 4. VOS-viewers Visualization on Trends in Research on PBL Science in Elementary Schools from 2017 to 2021

Nodes are the keywords that appear in the VOS-viewer visualization. To read the existing node network, each cluster is represented by a different color. Cluster 1 includes red nodes, Cluster 2 includes green nodes, Cluster 3 includes dark blue nodes, Cluster 4 includes yellow nodes, Cluster 5 includes purple nodes, Cluster 6 includes light blue nodes, and Cluster 7 includes orange nodes.

Table 1. Items contained in the VOS-viewer Visualization Clusters

Num	Cluster	Items dan Occurrences
1.	Cluster 1 (red node)	science learning outcomes (19), critical thinking skills (8), Problem-Based Learning (56), e-module development (2)
2.	Cluster 2 (green node)	learning outcomes (13), science (2), PBL (2), Tri Hita Karana (2)
3.	Cluster 3 (dark blue node)	science process skills (3), Problem-Based Learning model (15), learning achievement (2)
4.	Cluster 4 (yellow node)	human muscle disorder (2), science learning (10), problem solving (3)
5.	Cluster 5 (purple node)	critical thinking skills (5), science process skills (2), mastery of science concepts (3)
6.	Cluster 6 (light blue node)	critical thinking (3), problem solving (2), elementary school (3)
7.	Cluster 7 (orange node)	audio visual (3), learning motivation (3)

The VOS-viewer visualization data is reflected in the "Problem-based Learning" item, which is linked to other items. In other words, the items associated with the "problem-based learning" item have the highest level of correlation with other terms. *Occurrences* demonstrate how a node is linked to other nodes, whereas strength represents the link's strength, which is estimated based on its existence in the selected article. Based on our findings, we believe that the nodes that appear in a light color are nodes that are infrequently used as research topics. Nodes with faint hues and located far from the dominating node, on the other hand, are frequently used in research, resulting in saturated study subjects. This possibility exists because there is no guarantee in VOS-viewer that the nodes placed at the edge of the image are the nodes that are rarely used for whatever reason. As a result, researchers must be able to assess data based on factual data in the field in order to provide recommendations for study trends that are relevant to the needs of researchers and have the potential to be investigated in the future.

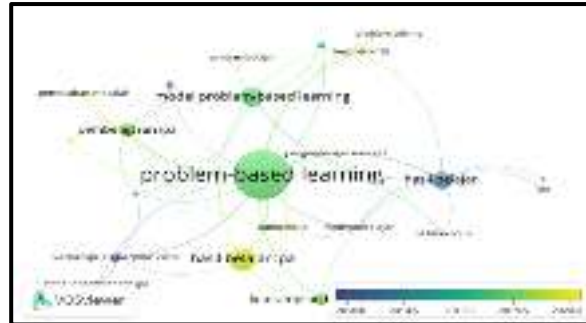

Figure 5. The Overlay Visualization of the keywords “*penerapan Problem-based Learning IPA di Sekolah Dasar*” (The implementation of Problem-Based Science Learning in Elementary Schools)

The overlay visualization shows that the "Tri Hita Karana" node is associated with the "Problem-based Learning" item with two occurrences and three total strengths. The findings of occurrences and strengths indicate that "Tri Hita Karana" is one of the items developed in earlier years of research. However, according to Google Scholar statistics, which include 6,000 publications, the topic has received little attention in the past five years. Thus, we recommend the item "Tri Hita Karana" as a research theme for future investigation. The term "Tri Hita Karana" refers to a science learning process that can promote students' behavior to appreciate nature and all living things.

Figure 6. The Overlay Visualization of Tri Hita Karana

Metadata and the VOS viewer show trends in research on the application of problem-based science learning in elementary schools from 2017 to 2021. The analysis results suggest research topics or items that can be developed further by future researchers. "Tri Hita Karana" is one of the items indicated by the study's findings. The term "Tri Hita Karana" refers to a science learning approach that helps shape students' positive attitudes toward nature, including respect for nature and all of its inhabitants. "Tri Hita Karana" is an educational concept developed based on the local wisdom in Bali. This philosophy teaches mankind to live in harmony with God, their fellow humans, including themselves, and everything around them, including the environment. However, the visualization findings suggest that "science process skills," "problem solving," "human muscle disorders," and "e-module creation" have the potential to be further developed due to their low occurrence rates.

#### 4. CONCLUSION

The analysis showed that, between 2017 and 2021, 98 articles on problem-based science learning were published in national and international journals. The highest number of articles related to this topic (23 publications) were published in 2020. The number of publications with the keywords "penerapan problem-based learning" (the implementation of problem-based science learning in elementary schools) fluctuated every year between 2017 and 2021, but the fluctuation did not occur significantly.

The keywords that appear the most in the published articles analyzed in this study are problem-based learning, learning outcomes, critical thinking skills, and science learning. A VOS-viewer metadata analysis on the keywords "penerapan problem-based learning IPA di Sekolah Dasar" (the implementation of problem-based science learning in elementary schools) suggests "Tri Hita Karana" as a research subject that should be investigated further. Tri Hita Karana refers to a science-based learning approach that helps instill in students a positive attitude towards nature, including respect for nature and all of its inhabitants. Tri Hita Karana is an educational concept developed based on local wisdom in Bali. This philosophy teaches humankind to live in harmony with God, those around them, including themselves, and everything around them, including the environment.

### ABSTRACT

This study aims to identify publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design in which descriptive, qualitative, and bibliometric analyses were used to look at the data. We selected the sample by using the purposive sampling technique. Secondary data contains SINTA-indexed research articles published in the Google Scholar database. Data were analyzed using content analysis and the VOS Viewer. The results of the analysis show that between 2017 and 2021, 98 articles have been published with the keywords "problem-based learning" and "IPA" in national and international journals with research settings in Indonesia. Most publications occurred in 2020. The keywords that appear the most in the published articles obtained are [problem-based learning], [learning outcomes], [critical thinking skills], and [science learning]. The keyword [trihita karana] appears, but with weak nodes. These keywords appear in many publications whose research settings are in Bali because they are ethnoscientific findings from that area. Weak nodes have several conjectures, namely that this theme has been researched to saturation or that research on this theme is still rarely carried out. This research contributes ideas for future research involving the theme of problem-based learning in science.

## 1. INTRODUCTION

Education is the process of acquiring scientific skills. It provides each individual with academic knowledge, social skills, the ability to explore one's potential, and the ability to use technology [1]. Educators and students have a mutually beneficial relationship in an educational institution. The method of teaching knowledge can be complicated at times in order to attain learning objectives [2]. The role of education in creating a quality generation is inextricably linked to the quality of learning. Learning contributes to the development of pupils' potential, personality, intelligence, and character[3]. Learning is a two-way interaction in which the teacher offers material, and the students receive the material being taught [4]. Learning can also be viewed as a stage in which the learning environment is regulated and conditioned to promote student character.

Learning is help given to pupils by educators to ensure that the process of acquiring knowledge goes smoothly [5]. An effective learning process positively impacts students' abilities and personalities. Learning builds students' strong characters, allowing them to assimilate into their social surroundings. Learning activities are

deemed effective when designed according to the student's performance level [6]. Elementary school students receive learning that underpins the delivery of knowledge [7]. Learning at the elementary school level must focus on student qualities, especially being energetic and curious.

Elementary school students enjoy learning that includes games. Learning while playing helps children learn and absorb information more enjoyably and effectively. Elementary school students think in concrete and logical ways; thus, they understand things realistically [8]. Elementary school students learn by gaining knowledge through hands-on activities [9]. Pupils in elementary school have excellent observational abilities, so educators must be able to design learning that support the development of students' observational skills.

Schools play a significant role in shaping students' character and personalities [10]. A student character created during the learning process represents a school system. The role of the teacher in the learning process cannot be isolated from the quality of an education system [11]. The learning process is strongly dependent on the learning model used by the teacher in the classroom. A learning model should depict a systematic method to assist students in achieving the learning objectives [12]. It refers to a method, strategy, model, or technique for facilitating communication in the classroom. Teachers should develop the learning model in such a way as to help students achieve the previously established learning objectives. Experts have created many learning models based on learning principles, psychological theory, sociological theory, and supporting system analysis [13]. A learning model approaches the learning process to promote students' active participation, attitudes, and knowledge.

Learning models aim to facilitate the delivery of learning materials and realize predetermined learning strategies [14]. Besides optimizing learning outcomes, learning models can also provide teachers and students with a broad picture of learning philosophy [15]. Optimizing the learning model's implementation will increase students' motivation to achieve higher learning outcomes [16]. It should be noted that the learning model used in class must be designed with the nature and type of information to be taught in mind, so that the inter-factors that make it up function as a unified whole. The unity of this learning model will later impact how students perceive learning material and reach learning goals. In the learning process, many different types of learning models can be used. However, a teacher must carefully select and implement the appropriate learning model to provide students with a positive learning experience.

Teachers must be able to choose learning concepts that stimulate students' critical thinking skills. Problem-Based Learning (PBL) is an example of a learning approach that is suitable for the concept. Problem-Based Learning is an instructional approach that uses everyday problems to train students' critical thinking skills [17]. PBL allows students to investigate and evaluate the situations presented by the teacher [18]. The steps in the problem-based learning model involve providing students with problem orientation, arranging for students to conduct research, requiring students to conduct analysis independently and in groups, and motivating students to develop and present the outcomes of the analysis. At the final stage of PBL, the teacher and students analyze and draw conclusions based on the problem-solving results [19].

The teacher serves as the learning facilitator in Problem-Based Learning, allowing students to actively participate in the learning process [20]. Problem-based learning has been shown to improve students' knowledge and comprehension of concepts or ideas [21]. PBL requires students to identify and solve problems [22]. This problem-solving process will sharpen students' critical, observational, active, and creative thinking abilities, allowing them to identify solutions to these problems. Problem-based learning includes activities that are quite similar to the concept of learning science. Learning science in elementary school, for example, teaches pupils how to solve issues and think critically and rationally.

Science education should enable students to apply scientific concepts to real-world problems. As a school subject, natural science teaches students how to interact with their surroundings [23]. Science education builds students' attitudes, nimble skills, far-reaching ideas, and problem-solving skills. Science education must also be able to develop students' skills to solve problems with reasoning and analysis [24]. Science learning involves experimental activities or observations of natural occurrences that assist students in developing a working knowledge of science [25]. Problem-based learning (PBL) integrated into science classes can engage students in active learning.

Education research will continue to establish new networks to discover new research breakthroughs. It is impossible to deny that education research is a rapidly developing subject of study. Many studies have been carried out to investigate the integration of the PBL model and the IPA technique. Researchers around the world have been studying the effectiveness of PBL in science education. As a result, we should investigate the literature on the topic under consideration. The literature in this section is meant to expand on findings related to a theme. Bibliometric analysis is one of the techniques of analysis that can be used in a literature review. Bibliometric analysis can be used to assess the productivity of writers, organizations, and cross-theme collaborations [26].

A bibliometric analysis contains bibliographic studies or scientific activities carried out by a researcher [27]. It refers to a method for determining the publishing trend of a variable using a statistical or mathematical methodology [28]. The bibliography collection is evaluated to create publication trend maps, which are movements in a phenomenon, to find out the most recent information. A bibliometric analysis employs a quantitative approach

to examine publication patterns such as subjects, authors, citations, titles, and other factors [29]. The current study examined a collection of published articles to see if there were any trends in the related variables. The articles were sorted according to predefined criteria. The VosViewer program was used to process the data. The VosViewer displays were evaluated to discover the trends of the connected variables. The findings of this study will be useful to other scholars looking for literature or references on the integration of PBL and natural sciences in elementary schools.

## 2. METHOD

This study employed mixed methods, combining descriptive and bibliometric analysis. The research sample was determined using a purposive sampling technique. The secondary data sources for this study were the Google Scholar database, which includes papers published in national and international journals. The national journals that published these publications are accredited on a national level (Sinta 1–5). Meanwhile, the international journals that were reviewed must be indexed by Scopus. The articles were published between 2017 and 2022. This study examined 98 articles that were sorted using predetermined criteria. Data analysis was assisted by VOS-Viewer and Mendeley. The data analysis consisted of several stages. First, we collected articles that contain topics that are in line with the research objective. Following that, we examined and sorted the articles based on the criteria that had been set before transforming the article format to RIS using Mendeley. The data in the RIS form was then processed using the VOS-viewer tool with the co-occurrence analysis type setting and full-count calculation method, resulting in a minimum of two keywords being displayed (a total of 22 keywords). The VOS-viewer visualization was analyzed to answer the research question. The results of data analysis on VOS-Viewer were network mapping images containing 22 networks and 7 clusters of research topics with different colors.

## 3. RESULTS AND DISCUSSION

### 3.1 The Development of Research on the Application of Problem-Based Science Learning in Elementary Schools

We first discovered 14,500 articles with the keywords "penerapan problem-based learning IPA di Sekolah Dasar" (the implementation of problem-based science learning in elementary schools). Then, the articles were sorted depending on the journals' accreditation. Articles from national journals indexed by Sinta 1–5 and international journals indexed by Scopus were used in this study. In this investigation, 98 publications met the criterion for journal accreditation. Figure 1 depicts the rise in the number of research papers published on problem-based science learning in elementary schools from 2017 to 2020. However, the number of publications on this topic decreased significantly between 2018 and 2019.

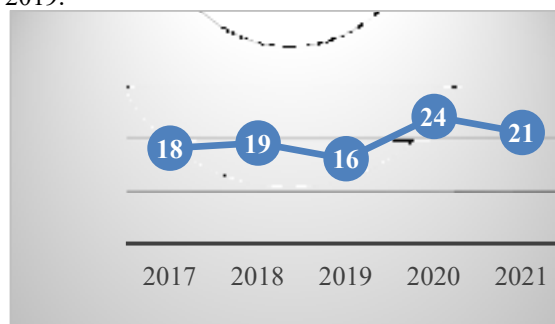

Figure 1. Number of Publications on the PBL in Elementary Schools in 2017-2021

Every year between 2017 and 2021, a different number of articles about the implementation of problem-based science learning in elementary schools were published. The year with the most publications (24 publications) was 2020, while the year with the fewest publications (16 publications) was 2019. In 2017, eighteen articles on PBL Science in primary schools were published in national and international journals, followed by 19 in 2021 and 21 in 2021. The data reveals that the number of publications on the implementation of PBL science in elementary schools has fluctuated between 2017 and 2021. The quantity of this publication can serve as an indicator of the current year's research trends [30].

### 3.2 Specifications of National and International Journals Publishing Articles on the Implementation of Problem-Based Science Learning in Elementary Schools

This analysis employed articles from national journals indexed by Sinta 1, Sinta 2, Sinta 3, Sinta 4, and Sinta 5 and international journals indexed by Scopus. In this investigation, 98 articles from the Google Scholar database met the journal accreditation criteria. Researchers in Indonesia use the Scopus and Sinta indexes to measure different things [30]. While Scopus is a global index that covers a wide range of disciplines and journals, Sinta is

focused solely on research output in Indonesia. Researchers in Indonesia may use both indexes to measure different aspects of their research performance, depending on their goals and the audience they are targeting.

### 3.2.1 Number of Articles Published in National Sinta-Indexed Journals

Among the ninety-eight articles used in the data analysis, 92 articles were published by national journals indexed by Sinta 1–5. Figure 2 presents a data visualization of the number of articles published in national journals on the application of problem-based science learning in elementary schools.

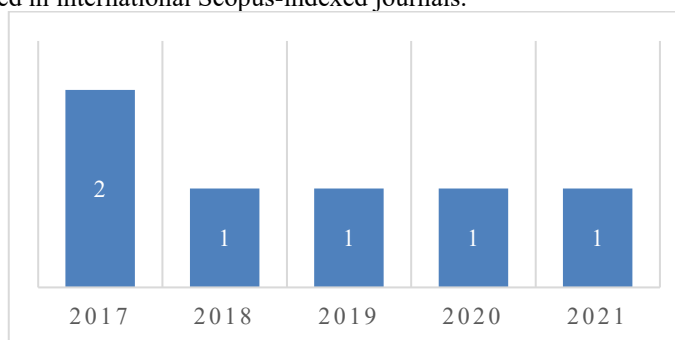

**Figure 2. Number of Publication of PBL in Elementary Schools published in national journals**

The highest number of publications (23 articles) was found in 2020, followed by 20 publications in 2021. Meanwhile, the lowest number of publications (15 articles) was observed in 2019, 18 articles were published in 2018, and 17 articles were published in 2017. The high number of publications can be attributed to pandemic-era research trends, such as online learning. This remote, online learning approach is very suitable for the problem-based learning model [31], [32]. During the pandemic, there has been a huge rise in the use of online learning platforms and technologies, and many researchers have been looking at how well these methods work for implementing PBL in remote settings. Because, there are now a lot more research papers about PBL and online learning. Overall, the pandemic has given researchers and teachers a chance to try out new ways to teach and learn, and online learning has become a big part of this change [33]. As the pandemic continues, it is likely that research in this area will continue to grow as educators and researchers seek to improve the effectiveness of remote learning approaches and address the challenges posed by this new educational landscape.

### 3.2.2 Number of Articles Published in International Scopus-Indexed Journals

Figure 3 displays the number of articles on the implementation of problem-based science learning in elementary schools published in international Scopus-indexed journals.

**Figure 3. Number of Publication of PBL in Elementary Schools published in international journals**

Figure 3 indicates that six articles were published in international journals between 2017 and 2021. The highest number of articles (2 articles) published in the journals was found in 2017. From 2018 to 2021, one article was published every year.

### 3.3 Trends in Research on Problem-Based Science Learning in Elementary Schools on VOS-viewers

The VOS-Viewers application was used to analyze trends in research on the use of problem-based science learning in elementary schools from 2017 to 2021. Articles chosen based on journal accreditation were then imported into the Mendeley application and saved in the RIS format. Using VOS-Viewer, the obtained data were processed by configuring the co-occurrence computation of complete counting and units of analysis with keywords [34]. This form of analysis can be used to detect patterns and relationships between keywords or terms in a dataset, thereby assisting academics in identifying interesting study themes and areas. By displaying the co-occurrence

network, researchers may determine which terms are most closely related and how they are interconnected within the network.

The analysis resulted in 138 keywords in 98 articles on related themes. However, after limiting the number of occurrences to two, we obtained twenty-three keywords. The data visualization was separated into some clusters, and each cluster was assigned a distinct color. Each cluster contains similar terms or subjects, as well as keywords that stand out in the set of articles that have been shown.

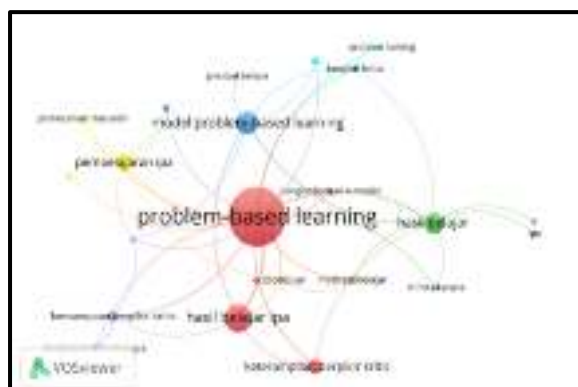

Figure 4. VOS-viewers Visualization on Trends in Research on PBL Science in Elementary Schools  
Nodes are the keywords that appear in the VOS-viewer visualization. To read the existing node network, each cluster is represented by a different color. Cluster 1 includes red nodes, Cluster 2 includes green nodes, Cluster 3 includes dark blue nodes, Cluster 4 includes yellow nodes, Cluster 5 includes purple nodes, Cluster 6 includes light blue nodes, and Cluster 7 includes orange nodes.

Table 1. Items contained in the VOS-viewer Visualization Clusters

Num	Cluster	Items dan Occurrences
1.	Cluster 1 (red node)	science learning outcomes (19), critical thinking skills (8), Problem-Based Learning (56), e-module development (2)
2.	Cluster 2 (green node)	learning outcomes (13), science (2), PBL (2), Tri Hita Karana (2)
3.	Cluster 3 (dark blue node)	science process skills (3), Problem-Based Learning model (15), learning achievement (2)
4.	Cluster 4 (yellow node)	human muscle disorder (2), science learning (10), problem solving (3)
5.	Cluster 5 (purple node)	critical thinking skills (5), science process skills (2), mastery of science concepts (3)
6.	Cluster 6 (light blue node)	critical thinking (3), problem solving (2), elementary school (3)
7.	Cluster 7 (orange node)	audio visual (3), learning motivation (3)

The VOS-viewer visualization data is reflected in the "Problem-based Learning" item, which is linked to other items. In other words, the items associated with the "problem-based learning" item have the highest level of correlation with other terms. *Occurrences* demonstrate how a node is linked to other nodes, whereas strength represents the link's strength, which is estimated based on its existence in the selected article. Based on our findings, we believe that the nodes that appear in a light color are nodes that are infrequently used as research topics. Nodes with faint hues and located far from the dominating node, on the other hand, are frequently used in research, resulting in saturated study subjects. This possibility exists because there is no guarantee in VOS-viewer that the nodes placed at the edge of the image are the nodes that are rarely used for whatever reason. As a result, researchers must be able to assess data based on factual data in the field in order to provide recommendations for study trends that are relevant to the needs of researchers and have the potential to be investigated in the future.

instill in students a positive attitude towards nature, including respect for nature and all of its inhabitants. Tri Hita Karana is an educational concept developed based on local wisdom in Bali. This philosophy teaches humankind to live in harmony with God, those around them, including themselves, and everything around them, including the environment.

### ABSTRACT

This study aims to identify publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design in which descriptive, qualitative, and bibliometric analyses were used to look at the data. We selected the sample by using the purposive sampling technique. Secondary data contains Sinta-indexed research articles published in the Google Scholar database. Data were analyzed using content analysis and the VOS-Viewer. The results of the analysis show that between 2017 and 2021, 98 articles have been published with the keywords [problem-based learning] and [IPA or science learning] in national and international journals with research settings in Indonesia. Most publications occurred in 2020. The keywords that appear the most in the published articles obtained are [problem-based learning], [learning outcomes], [critical thinking skills], and [science learning]. The keyword [*Tri Hita Karana*], or three causes of well-being, appears, but with weak nodes. These keywords appear in many publications whose research settings are in Bali because they are ethnoscientific findings from that area. Weak nodes have several conjectures, namely that this theme has been researched to saturate or that research on this theme is still rarely carried out. This research contributes ideas for future research involving the theme of problem-based learning in science.

## 1. INTRODUCTION

Education is the process of acquiring scientific skills. It provides each individual with academic knowledge, social skills, the ability to explore one's potential, and the ability to use technology [1]. In an educational institution, educators and students have a mutually beneficial relationship. The method of teaching knowledge can be complicated at times in order to attain learning objectives [2]. The role of education in creating a quality generation is inextricably linked to the quality of learning. Learning contributes to the development of pupils' potential, personality, intelligence, and character [3]. Learning is a two-way interaction in which the teacher offers material, and the students receive the material being taught [4]. Learning can also be viewed as a stage in which the learning environment is regulated and conditioned to promote student character.

Learning is help given to pupils by educators to ensure that the process of acquiring knowledge goes smoothly [5]. An effective learning process positively impacts students' abilities and personalities. Learning builds students' strong characters [6], [7], allowing them to assimilate into their social surroundings.

Learning activities are deemed effective when designed according to the student's performance level [8]. Elementary school students receive learning that underpins the delivery of knowledge [9]. Learning at the elementary school level must focus on student qualities, especially being energetic and curious.

Elementary school students enjoy learning that includes games [10], [11]. Learning while playing helps children learn and absorb information more enjoyably and effectively. Elementary school students think in concrete and logical ways; thus, they understand things realistically [12]. Elementary school students learn by gaining knowledge through hands-on activities [13]. Pupils in elementary school have excellent observational abilities, so educators must be able to design learning that supports the development of students' observational skills.

Schools play a significant role in shaping students' character and personalities [14]. A student character created during the learning process represents a school system. The role of the teacher in the learning process cannot be isolated from the quality of an education system [15]. The learning model the teacher uses in the classroom has a significant impact on the learning process. A learning model should depict a systematic method to assist students in achieving the learning objectives [16]. It refers to a method, strategy, model, or technique for facilitating communication in the classroom. Teachers should develop the learning model in such a way as to help students achieve the previously established learning objectives. Experts have created many learning models based on learning principles, psychological theory, sociological theory, and supporting system analysis [17]. A learning model approaches the learning process to promote students' active participation, attitudes, and knowledge.

Learning models aim to facilitate the delivery of learning materials and realize predetermined learning strategies [18]. Besides optimizing learning outcomes, learning models can also provide teachers and students with a broad picture of learning philosophy [19]. Optimizing the learning model's implementation will increase students' motivation to achieve higher learning outcomes [20]. It should be noted that the learning model used in class must be designed with the nature and type of information to be taught in mind so that the inter-factors that make it up function as a unified whole. The unity of this learning model will later impact how students perceive learning material and reach learning goals. In the learning process, many different types of learning models can be used. However, a teacher must carefully select and implement the appropriate learning model to provide students with a positive learning experience.

Teachers must be able to choose learning concepts that stimulate students' critical thinking skills. Problem-based learning (PBL) is an example of a learning approach that is suitable for the concept. Problem-based learning is an instructional approach that uses everyday problems to train students' critical thinking skills [21]. PBL allows students to investigate and evaluate the situations presented by the teacher [22]. The steps in the problem-based learning model involve providing students with problem orientation, arranging for students to conduct research, requiring students to conduct analysis independently and in groups, and motivating students to develop and present the outcomes of the analysis. At the final stage of PBL, the teacher and students analyze and draw conclusions based on the problem-solving results [23].

The teacher serves as the learning facilitator in PBL, allowing students to actively participate in the learning process [24]. Problem-based learning has been shown to improve students' knowledge and comprehension of concepts or ideas [25]. PBL requires students to identify and solve problems [26]. This problem-solving process will sharpen students' critical, observational, active, and creative thinking abilities, allowing them to identify solutions to these problems. Problem-based learning includes activities that are quite similar to the concept of learning science. Learning science in elementary school, for example, teaches pupils how to solve issues and think critically and rationally.

Science education should enable students to apply scientific concepts to real-world problems. As a school subject, natural science teaches students how to interact with their surroundings [27]. Science education builds students' attitudes, nimble skills, far-reaching ideas, and problem-solving skills. Science education must also be able to develop students' skills to solve problems with reasoning and analysis [28]. Science learning involves experimental activities or observations of natural occurrences that assist students in developing a working knowledge of science [29]. Problem-based learning (PBL) integrated into science classes can engage students in active learning.

Education research will continue to establish new networks to discover new research breakthroughs. It is impossible to deny that educational research is a rapidly developing subject of study. Many studies have been carried out to investigate the integration of the PBL model and the science learning (IPA) technique. Researchers around the world have been studying the effectiveness of PBL in science education. As a result, we should investigate the literature on the topic under consideration. The literature in this section is meant to expand on findings related to a theme. Bibliometric analysis is one of the techniques of analysis that can be used in a literature review. Bibliometric analysis can be used to assess the productivity of writers, organizations, and cross-theme collaborations [30].

A bibliometric analysis contains bibliographic studies or scientific activities carried out by a researcher [31]. It refers to a method for determining the publishing trend of a variable using a statistical or mathematical methodology [32]. The bibliography collection is evaluated to create publication trend maps, which are movements in a phenomenon, to find out the most recent information. A bibliometric analysis employs a quantitative approach to examine publication patterns such as subjects, authors, citations, titles, and other factors [33]. The current study examined a collection of published articles to see if there were any trends in the related variables. The articles were sorted according to predefined criteria. The VOS-Viewer program was used to process the data. The VOS-Viewer displays were evaluated to discover the trends of the connected variables. The findings of this study will be useful to other scholars looking for literature or references on the integration of PBL and natural sciences in elementary schools.

## 2. RESEARCH METHOD

This study employed mixed methods, combining descriptive and bibliometric analysis. The research sample was determined using a purposive sampling technique. The secondary data sources for this study was the Google Scholar database, which includes papers published in national and international journals. The national journals that published these publications are accredited on a national level (Sinta 1–5). Meanwhile, the international journals that were reviewed must be indexed by Scopus. The articles were published between 2017 and 2022. This study examined 98 articles that were sorted using predetermined criteria.

Data analysis was assisted by VOS-Viewer and Mendeley. The data analysis consisted of several stages. First, we collected articles that contain topics that are in line with the research objective. Following that, we examined and sorted the articles based on the criteria that had been set before transforming the article format to RIS using Mendeley. The data in the RIS form was then processed using the VOS-Viewer tool with the co-occurrence analysis type setting and full-count calculation method, resulting in a minimum of two keywords being displayed (a total of 22 keywords). The VOS-Viewer visualization was analyzed to answer the research question. The results of data analysis on VOS-Viewer were network mapping images containing 22 networks and seven clusters of research topics with different colors.

## 3. RESULTS AND DISCUSSION

### 3.1. The development of research on the application of problem-based science learning in elementary schools

We first discovered 14,500 articles with the keywords [*penerapan problem-based learning IPA di sekolah dasar*] or ‘the implementation of problem-based science learning in elementary schools’. Then, the articles were sorted depending on the journals’ accreditation. Articles from national journals indexed by Sinta 1–5 and international journals indexed by Scopus were used in this study. In this investigation, 98 publications met the criteria for journal accreditation. Figure 1 depicts the rise in the number of research papers published on problem-based science learning in elementary schools from 2017 to 2020. However, the number of publications on this topic decreased significantly between 2018 and 2019.

Figure 1. Number of publications on the PBL in elementary schools in 2017-2021

Every year between 2017 and 2021, a different number of articles about the implementation of problem-based science learning in elementary schools were published. The year with the most publications

(24 publications) was 2020, while the year with the fewest publications (16 publications) was 2019. In 2017, eighteen articles on PBL science in primary schools were published in national and international journals, followed by 19 in 2021 and 21 in 2021. The data reveals that the number of publications on the implementation of PBL science in elementary schools has fluctuated between 2017 and 2021. The quantity of this publication can serve as an indicator of the current year's research trends [34].

### 3.2. Specifications of national and international journals publishing articles on the implementation of problem-based science learning in elementary schools

This analysis employed articles from national journals indexed by Sinta 1, Sinta 2, Sinta 3, Sinta 4, and Sinta 5 and international journals indexed by Scopus. In this investigation, 98 articles from the Google Scholar database met the journal accreditation criteria. Researchers in Indonesia use the Scopus and Sinta indexes to measure different things [34]. While Scopus is a global index that covers a wide range of disciplines and journals [35], Sinta is focused solely on research output in Indonesia, isolating the precise impact of SINTA remains challenging [36]. Researchers in Indonesia may use both indices to measure different aspects of their research performance [37], depending on their goals and the audience they are targeting.

#### 3.2.1. Number of articles published in national Sinta-indexed journals

Among the 98 articles used in the data analysis, 92 articles were published by national journals indexed by Sinta 1–5. Figure 2 presents a data visualization of the number of articles published in national journals on the application of problem-based science learning in elementary schools. The highest number of publications (23 articles) was found in 2020, followed by 20 publications in 2021. Meanwhile, the lowest number of publications (15 articles) was observed in 2019, 18 articles were published in 2018, and 17 articles were published in 2017. The high number of publications can be attributed to pandemic-era research trends such as online learning. This remote, online learning approach is very suitable for the problem-based learning model [38], [39]. During the pandemic, there has been a huge rise in the use of online learning platforms and technologies, and many researchers have been looking at how well these methods work for implementing PBL in remote settings [40]–[42]. Because there are now a lot more research papers about PBL and online learning. Overall, the pandemic has given researchers and teachers a chance to try out new ways to teach and learn, and online learning has become a big part of this change [43]. As the pandemic continues, it is likely that research in this area will continue to grow as educators and researchers seek to improve the effectiveness of remote learning approaches [44] and address the challenges posed by this new educational landscape.

Figure 2. Number of publications on PBL in elementary schools published in national journals

#### 3.2.2. Number of articles published in international scopus-indexed journals

Figure 3 displays the number of articles on the implementation of problem-based science learning in elementary schools published in international Scopus-indexed journals. Figure 3 indicates that six articles were published in international journals between 2017 and 2021. The highest number of articles (two articles) published in the journals was found in 2017. From 2018 to 2021, one article was published every year.

Table 1. Items contained in the VOS-Viewer visualization clusters

Num	Cluster	Items and occurrences
1	Cluster 1 (red node)	Science learning outcomes (19), critical thinking skills (8), problem-based learning (56), e-module development (2)
2	Cluster 2 (green node)	Learning outcomes (13), science (2), PBL (2), <i>Tri Hita Karana</i> or three causes of well-being (2)
3	Cluster 3 (dark blue node)	Science process skills (3), problem-based learning model (15), learning achievement (2)
4	Cluster 4 (yellow node)	Human muscle disorder (2), science learning (10), problem solving (3)
5	Cluster 5 (purple node)	Critical thinking skills (5), science process skills (2), mastery of science concepts (3)
6	Cluster 6 (light blue node)	Critical thinking (3), problem solving (2), elementary school (3)
7	Cluster 7 (orange node)	Audio visual (3), learning motivation (3)

The VOS-Viewer visualization data is reflected in the ‘problem-based learning’ item, which is linked to other items. In other words, the items associated with the ‘problem-based learning’ item have the highest level of correlation with other terms. We can see the overlay visualization of its keywords in Figure 5. Occurrences demonstrate how a node is linked to other nodes, whereas strength represents the link’s strength, which is estimated based on its existence in the selected article. Based on our findings, we believe that the nodes that appear in a light color are nodes that are infrequently used as research topics. Nodes with faint hues and located far from the dominating node, on the other hand, are frequently used in research, resulting in saturated study subjects. This possibility exists because there is no guarantee in VOS-Viewer that the nodes placed at the edge of the image are the nodes that are rarely used for whatever reason. As a result, researchers must be able to assess data based on factual data in the field in order to provide recommendations for study trends that are relevant to the needs of researchers and have the potential to be investigated in the future.

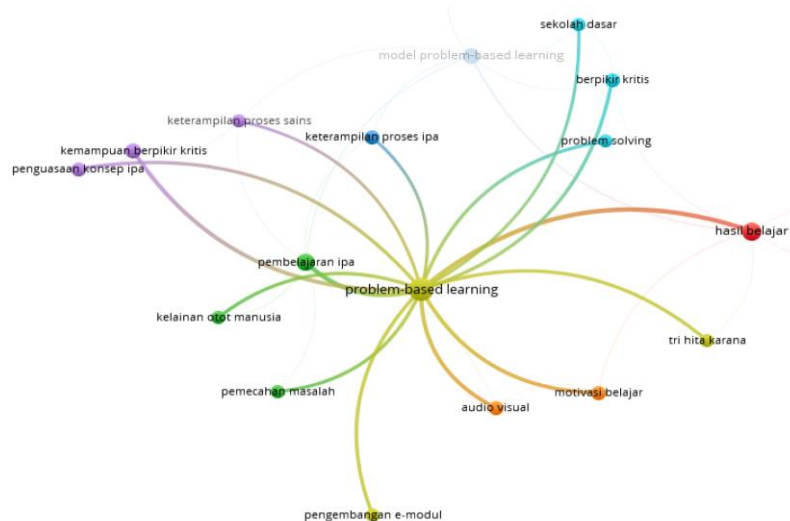

Figure 5. The overlay visualization of the keywords [*problem-based learning IPA di sekolah dasar*] or the implementation of problem-based science learning in elementary schools

The overlay visualization shows that the [*Tri Hita Karana*] node is associated with the [problem-based learning] item with two occurrences and three total strengths. The findings of occurrences and strengths indicate that [*Tri Hita Karana*] is one of the items developed in earlier years of research. However, according to Google Scholar statistics, which include 6,000 publications, the topic has received little attention in the past five years. Thus, we recommend the item [*Tri Hita Karana*] as a research theme for future investigation. The term [*Tri Hita Karana*] refers to a science learning process that can promote students’ behavior to appreciate nature and all living things. The overlay visualization of [*Tri Hita Karana*] is shown in Figure 6.

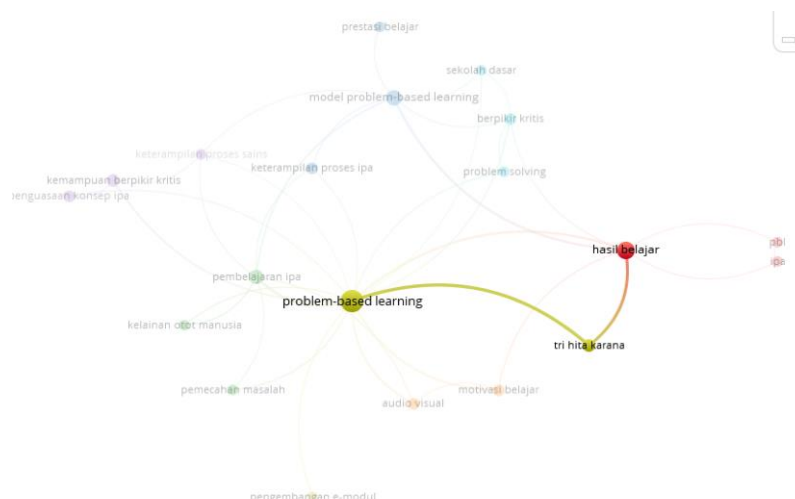

Figure 6. The overlay visualization of *Tri Hita Karana*

Metadata and the VOS viewer show trends in research on the application of problem-based science learning in elementary schools from 2017 to 2021. The analysis's findings offer potential research topics or items for future researchers to explore further. The [*Tri Hita Karana*] is one of the items indicated by the study's findings. The term [*Tri Hita Karana*] refers to a science learning approach that helps shape students' positive attitudes toward nature, including respect for nature and all of its inhabitants. The [*Tri Hita Karana*] is an educational concept developed based on the local wisdom in Bali. This philosophy teaches mankind to live in harmony with God, their fellow humans, including themselves, and everything around them, including the environment. However, the visualization findings suggest that [science process skills], [problem solving], [human muscle disorders], and [e-module creation] have the potential to be further developed due to their low occurrence rates.

#### 4. CONCLUSION

The analysis showed that, between 2017 and 2021, 98 articles on problem-based science learning were published in national and international journals. The highest number of articles related to this topic (23 publications) were published in 2020. The number of publications with the keywords [*penerapan problem-based learning*] or 'the implementation of problem-based science learning in elementary schools' fluctuated every year between 2017 and 2021, but the fluctuation did not occur significantly. The keywords that appear the most in the published articles analyzed in this study are problem-based learning, learning outcomes, critical thinking skills, and science learning. A VOS-Viewer metadata analysis on the keywords [*penerapan problem-based learning IPA di sekolah dasar*] or the implementation of problem-based science learning in elementary schools suggests [*Tri Hita Karana*] as a research subject that should be investigated further. The [*Tri Hita Karana*] refers to a science-based learning approach that helps instill in students a positive attitude towards nature, including respect for nature and all of its inhabitants. The [*Tri Hita Karana*] is an educational concept developed based on local wisdom in Bali. This philosophy teaches humankind to live in harmony with God, those around them, including themselves, and everything around them, including the environment.

## BIOGRAPHIES OF AUTHORS

**Anenggar Dewi Puspita**    is currently studying at the Department of Elementary School Teacher Education, Faculty of Teacher Training and Educational Sciences, Universitas Ahmad Dahlan. Her research interests include science education, the development of science educational tools, and learning interests. She can be contacted by email at [anenggar1800005160@webmail.uad.ac.id](mailto:anenggar1800005160@webmail.uad.ac.id).

**Ika Maryani**    is a faculty member at the Department of Elementary Teacher Education, Faculty of Teacher Training and Educational Sciences, Universitas Ahmad Dahlan. She has been actively involved in basic education research, particularly that that focuses on enhancing teacher competency and improving students' learning experiences. She graduated from Universitas Sebelas Maret with a bachelor's degree in chemistry education and a master's degree in science education. She earned her doctorate in education from Universitas Negeri Yogyakarta. She can be contacted by email at: [ika.maryani@pgsd.uad.ac.id](mailto:ika.maryani@pgsd.uad.ac.id).

**Hanum Hanifa Sukma**    is a member of the teaching staff at the Department of Elementary Teacher Education, Faculty of Teacher Training and Education, Universitas Ahmad Dahlan. She has been involved in basic education research, focusing on improving teacher competence and student learning experiences, as well as teaching Indonesian in elementary school. She graduated from Universitas Sebelas Maret with a bachelor's degree in elementary teacher education and a master's degree in basic education from Universitas Pendidikan Indonesia. She can be contacted by email at [hanum.sukma@pgsd.uad.ac.id](mailto:hanum.sukma@pgsd.uad.ac.id).

Dear Prof./Dr./Mr./Mrs. Ika Maryani,

It is my great pleasure to inform you that your paper entitled "PROBLEM-BASED SCIENCE LEARNING IN ELEMENTARY SCHOOLS: A BIBLIOMETRIC ANALYSIS" has been conditionally ACCEPTED and will be published in the Journal of Education and Learning (EduLearn). This journal is ACCREDITED (recognised) by the Ministry of Education, Culture, Research, and Technology, Republic of Indonesia (Decree No: 5162/E4/AK.04/2021), INDEXED by the ERIC Institute of Education Sciences (IES) of the U.S. Department of Education, and has just been accepted for inclusion in Scopus (<https://suggestor.step.scopus.com/progressTracker/?trackingID=4F4DD39B4F318CE6>).  
Congratulations!

## Problem-based science learning in elementary schools: A bibliometric analysis

Anenggar Dewi Puspita, Ika Maryani, Hanum Hanifa Sukma

### Abstract

This study aims to identify publication trends and recommendations for problem-based science learning research in elementary schools. We used a mixed-methods research design in which descriptive, qualitative, and bibliometric analyses were used to look at the data. We selected the sample by using the purposive sampling technique. Secondary data contains Sinta-indexed research articles published in the Google Scholar database. Data were analyzed using content analysis and the VOS-Viewer. The results of the analysis show that between 2017 and 2021, 98 articles have been published with the keywords [problem-based learning] and [IPA or science learning] in national and international journals with research settings in Indonesia. Most publications occurred in 2020. The keywords that appear the most in the published articles obtained are [problem-based learning], [learning outcomes], [critical thinking skills], and [science learning]. The keyword [*Tri Hita Karana*], or three causes of well-being, appears, but with weak nodes. These keywords appear in many publications whose research settings are in Bali because they are ethnoscientific findings from that area. Weak nodes have several conjectures, namely that this theme has been researched to saturate or that research on this theme is still rarely carried out. This research contributes ideas for future research involving the theme of problem-based learning in science.

### Keywords

Bibliometric analysis; Elementary school; Problem-based learning model; Science learning
