Note	From
Dear Maryudi Maryudi, We kindly inform you, that we have received your manuscript "Preparation and characterization on morphology of cellulose acetate membrane for environmental applications". Please send proposals of the four reviewers for your article with their email addresses. I have to inform you, that the reviewer of a paper can not be a person from the same institution as the authors, the reviewer should be different from another country than authors. Please provide ORCID numbers (https://orcid.org/) for the authors of the article (if they have). Please, conform the text to the Editorial Requirements (Enclosure) moving Figures out of the text, double spacing between rows, properly saved references - DOI numbers. Please send figures in editable format (preferred formats: Excel or Origin) and original photos in the highest possible resolution (jpg over 300 dpi).	mateuszborowski 2024-04-15 12:38 PM

Dear Maryudi Maryudi, Dhias Cahya Hakika, Amillia Amillia:

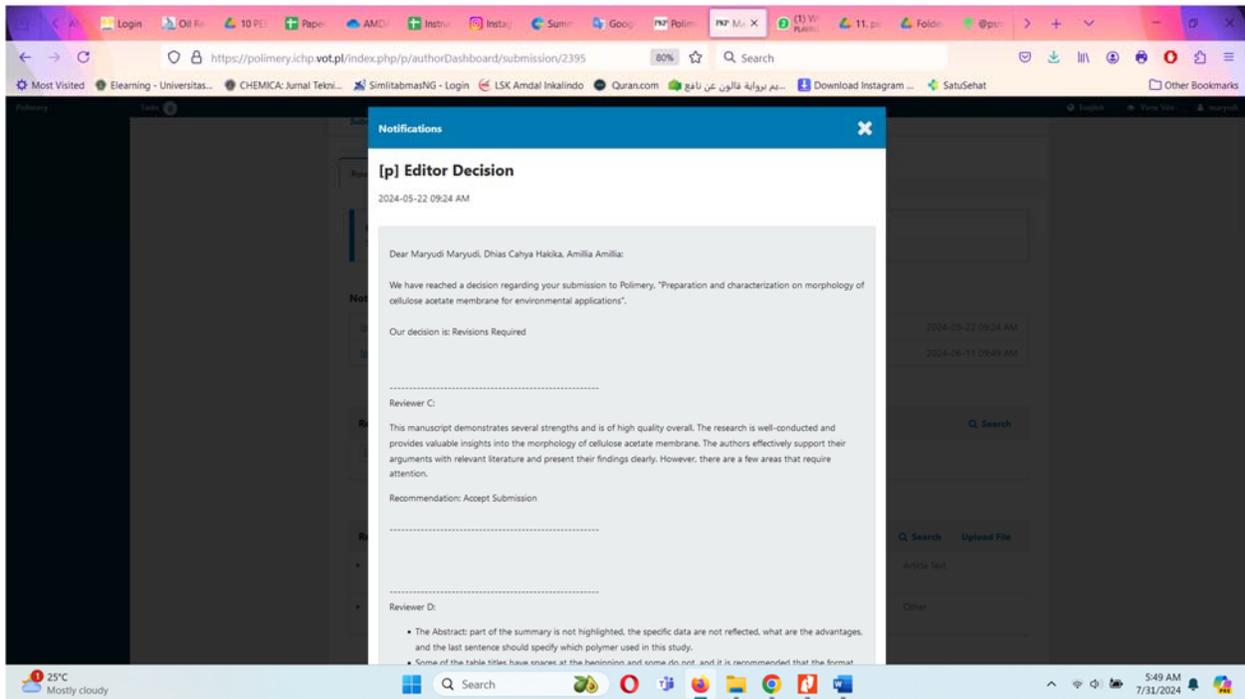

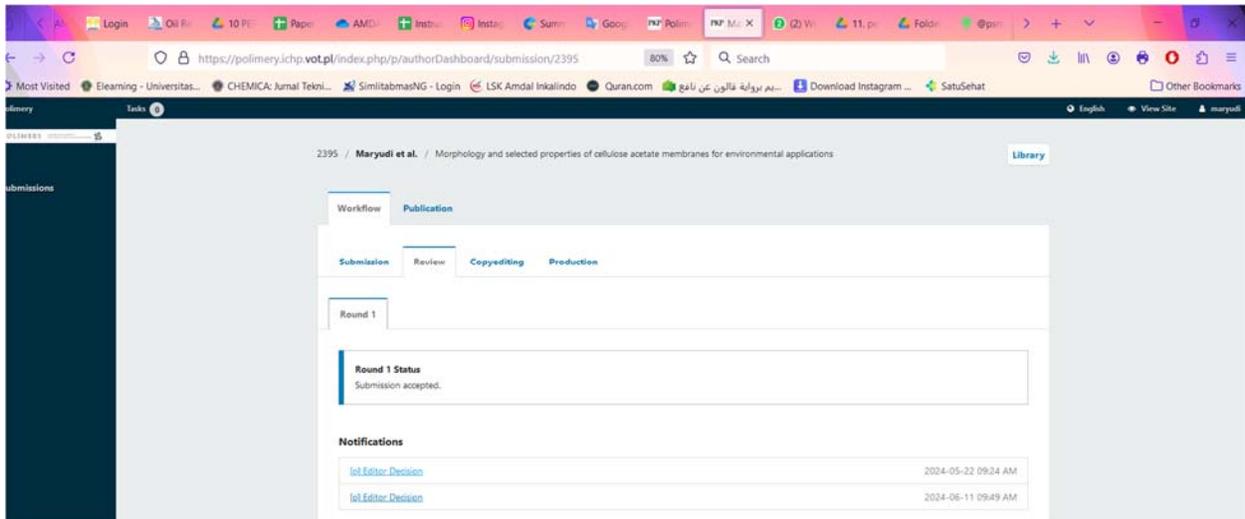

We have reached a decision regarding your submission to Polimery, "Preparation and characterization on morphology of cellulose acetate membrane for environmental applications".

Our decision is: Revisions Required

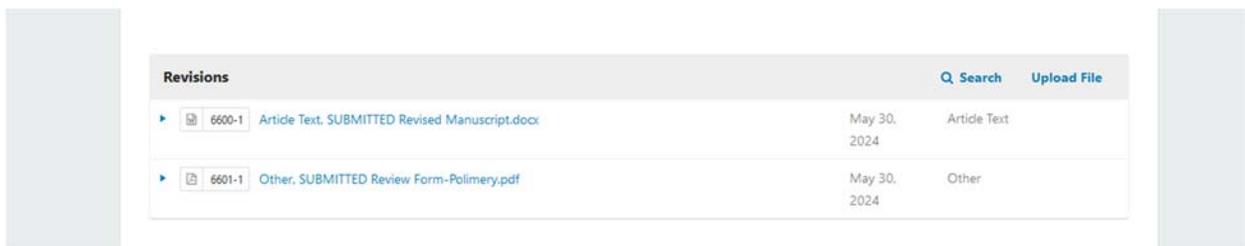

Reviewer C:

This manuscript demonstrates several strengths and is of high quality overall. The research is well-conducted and provides valuable insights into the morphology of cellulose acetate membrane. The authors effectively support their arguments with relevant literature and present their findings clearly. However, there are a few areas that require attention.

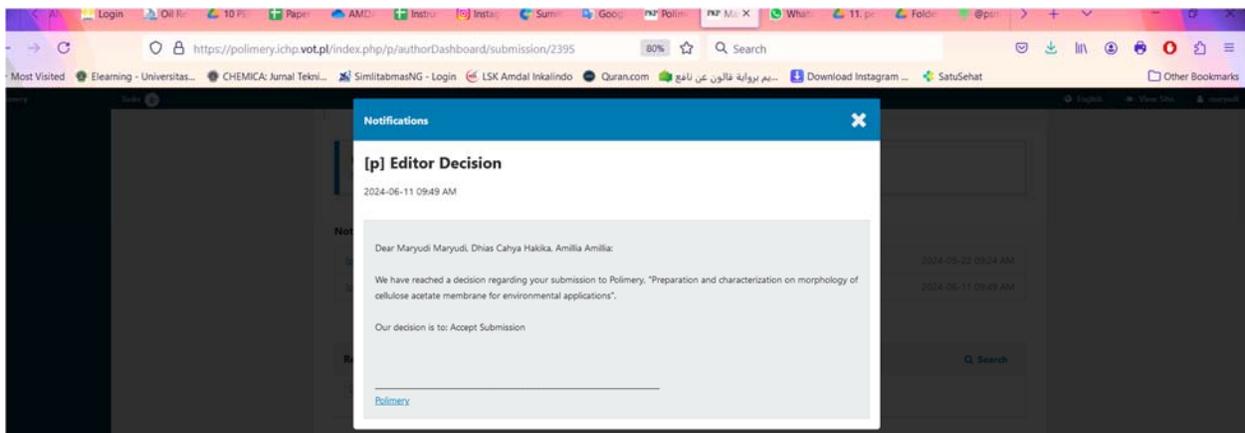

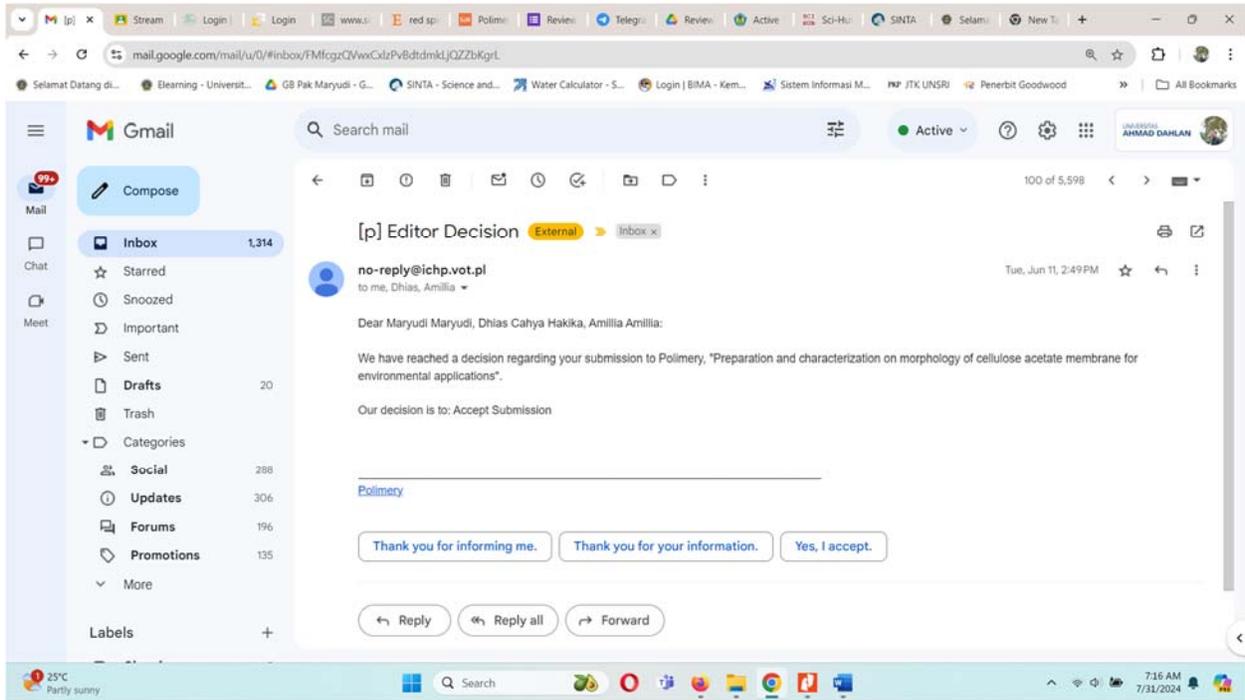

Recommendation: Accept Submission

30 Mei 2024: submit revisi

11 Juni 2024: accepted

Abstract
Microporous membranes were obtained by dry-wet phase inversion from a solution of cellulose acetate (CA) in acetone (13, 14 and 15 wt%). Polyethylene glycol was used as a blowing agent. The structure and mechanical properties were examined. FT-IR spectra show that the addition of polyethylene glycol improves the thermodynamics of the solution and increases the hydrophilicity of the membrane. The SEM method confirmed the microporous structure of membranes with an asymmetric structure and various pore sizes and porosities. Higher CA concentration resulted in better tensile properties.

Keywords
biopolymer ; cellulose acetate ; membrane ; phase inversion biopolymer ; octan celulozy ; membran ; inwersja faz

Struktura i wybrane właściwości membran z octanu celulozy do zastosowań środowiskowych

Streszczenie: Mikroporowate membrany otrzymano metodą inwersji fazy sucho-mokrej z roztworu octanu celulozy (CA) w acetonie (13, 14 i 15% mas.). Jako środek porotwórczy zastosowano glikol polietylenowy. Zbadano strukturę i właściwości mechaniczne. Widma FT-IR pokazują, że dodatek glikolu polietylenowego poprawia termodynamikę roztworu i zwiększa hydrofilowość membrany. Metodą SEM potwierdzono mikroporową strukturę membran o asymetrycznej budowie i różnej wielkości porów oraz porowatości. Większe stężenie CA skutkowało lepszymi właściwościami mechanicznymi przy rozciąganiu.

Słowa kluczowe: biopolimery, octan celulozy, membrany, inwersja faz.
