social psychology, especially regarding social conflict intention, stereotypes, and social identity. As for the practical implications of the research, it serves as a preventive model for social conflict in urban communities through an early warning system. The practical implications are based on the consideration that early warning systems have not yet been a preferred program in addressing social conflicts in Indonesia. This is evidenced by the limited research and implementation of early warning systems for social conflicts. Research and implementation of early warning systems in Indonesia are more focused on the field of health (Iqbal et al., 2020; Kautsar et al., 2023; Sagay & Pangemanan, 2023).

Method

The implementation of an early warning system using a quantitative approach with correlational and sequential models emphasizes the analysis of causal exogenous variables predicting endogenous variables that depict the occurrence of conflict. This type was chosen because it aligns with the research goal, which is to test stereotype and social identity predictors as endogenous variables with prejudice as a moderator contributing to the endogenous variable of social conflict intention. The research implementation follows a research design starting with identifying variables that cause conflict. After identifying the conflict-causing variables, the next steps involve explaining the theoretical model of conflict event dynamics, creating measurement tools, data collection, analysis, conceptual explanation of the analysis results, and providing

group feel threatened in their social environment. The threat is related to cultural differences between the in-group and out-group.

The subjects were selected using quota-cluster random sampling technique based on Krejcie table, resulting in 108 adolescents. The data collection instruments used for the subjects included stereotype scale, social identity scale, prejudice scale, and social conflict intention scale. The stereotype scale, consisting of dimensions of direction, intensity, accuracy, and content (Arendt, 2013; Nelson, 2014), comprised 20 items with corrected item-total correlations ranging from 0.381 to 0.613 and an alpha reliability coefficient of 0.888. An example item from the stereotype scale is: "Likes to mock others from different groups." The social identity scale contains components of categorization, identification, and social comparison (Best et al., 2016; Latif et al., 2021), consisting of 18 items with item-total correlations ranging from 0.309 to 0.683 and an alpha reliability coefficient of 0.882. An example item from the social identity scale is: "It is reasonable to defend one's own group because they are always right." The prejudice scale was constructed from

5. PENGIRIMAN REVISI

The screenshot shows a web browser window displaying the submission review page for the Journal of Educational, Health, and Community Psychology. The page is titled "Submission" and includes sections for "Peer Review" and "Editor Decision".

Submission Information:

- Authors: Hadi Suyono
- Title: Development of A Model for Social Conflict Intention in Urban Communities: Study of Stereotypes, Social Identity, and Prejudice as Early Warning Systems
- Section: Articles
- Editor: Elii Hayati

Peer Review - Round 1:

- Review Version: 28668-75615-1-RV.DOCX (2024-04-04)
- Initiated: 2024-04-06
- Last modified: 2024-05-16
- Uploaded file: Reviewer B 28668-75112-1-RV.DOCX (2024-05-16)

Editor Decision:

- Decision: Revisions Required (2024-05-16)
- Notify Editor: Editor/Author Email Record (2024-05-16)
- Editor Version: None
- Author Version: 28668-75180-1-ED.DOCX (2024-05-21) [DELETE]
