EVALUATION OF SMOKE-FREE AREA POLICY IMPLEMENTATION AT SCHOOLS IN YOGYAKARTA, INDONESIA

Heni Trisnowati, Utari Marlinawati

Department of Public Health, Faculty of Health Sciences, Universitas Respati Yogyakarta

ABSTRACT

Background: Tobacco use is a leading cause of morbidity and mortality worldwide. Despite the implementation of various tobacco control interventions (e.g. increased taxation, mass media campaigns, or smoke-free laws for indoor public places and workplaces) the prevalence of tobacco use remains high, especially in Indonesia. Due to mandatory attendance, secondary schools are a potential setting for implementing smoking bans to prevent tobacco use among adolescents. Moreover, schools can play a key role in tobacco interventions as adolescence is a critical time for acquiring new patterns such as smoking initiation. The purpose of this study was to evaluate smoke-free area policy implementation at schools in Yogyakarta, Indonesia.

Subjects and Method: This was a cross sectional study conducted in Yogyakarta. A sample of 162 of all 298 high schools in Yogyakarta was selected for this study by proportional stratified random sampling. The dependent variable was smoke-free area policy implementation. The independent variable was written local regulation and promotion media. The data was collected by survey and described accordingly.

Results: As many as 89.5% schools in Yogyakarta had written regulation about smoke free area policy. 88.3% schools had smoking ban program promotion media. 66% schools had smoke free area policy monitoring personnel. 88.9% schools had socialization about smoke free area policy. 90.1% schools had free area of cigarette smoking.

Conclusion: Adherence to smoke free area policy among schools in Yogyakarta is high. Socialization about smoke free area policy has yet to be enhanced.

Keywords: implementation, smoke, free, area, policy, school.
