ABSTRAK

Personal as explained for all decisions and actions and the results and impacts on others personal responsibility is an individual's skills in taking responsibility. Personal a sense of responsibility can affect important becomes student academic achievement, so having a sense of personal responsibility, especially in the learning process. Because personal or personal responsibility can be developed through self-regulated learning and learning autonomy. Before this study aims to determine whether there is a correlation between personal responsibility with self-regulated learning and learning autonomy. The method used in this study is quantitative with a correlational type of research involving 141 students from semester 2 to semester ten aged 18 to 24 years. The data collection technique uses three instruments (personal responsibility, self-regulated learning, and autonomy learning). This study's results indicate a correlation between the three variables, namely personal responsibility, self-regulated learning, and autonomy learning ($p > 0.000$). The existence of this relationship shows that it is important for students to cultivate personal responsibility so that they can manage the learning process without depending on others (independently).

PENDAHULUAN

Students at university are currently studying at tertiary institutions, both public and private, or other institutions that have the same level as universities (Suswoyo, 2007; Papilaya & Huliselan, 2016). Students are

seen as highly intellectual individuals who can think critically and plan action to act quickly and precisely. However, not only that, high intellectual abilities make each student have different abilities, such as in terms of learning speed, level of work, and learning style. One

of the characteristics of student learning is self-regulated learning.

Independently set their own learning goals and make efforts to monitor, regulate, control cognition, motivate themselves, and change their behavior according to these goals and the various contextual conditions that exist in the environment their study (Pintrich & De Groot, 1990; Lubis & Dewi, 2022). According to Li (2019), Self-regulated learning is defined as a strategy used by students to manage their cognitive abilities and a resource management strategy used by students to direct their learning. Panadero (2017) defines self-regulated learning as the main conceptual framework for understanding the learning process's cognitive, motivational, and emotional aspects. Self-regulated learning can be explained as the extent to which students can use their metacognitive abilities and motivation and play an active role in the independent learning process.

Zimmerman (Rahmawati et al., 2022) explains that aspects include metacognition, where individuals plan, set goals and evaluate the tasks. Second is motivation, where individuals have high confidence and enthusiasm in completing tasks. Third is the behavioral aspect, which includes individual efforts to create an optimal environment. If a student has these three aspects, they will have a high level of self-regulated learning, allowing them to self-regulate and set their learning goals (Ramadhani et al., 2019). Various research studies illustrate that self-regulated learning skills are skills that can be learned by students and can be developed through learning experiences. Research conducted by Kirana and Juliartiko (in Hendrika, 2022) found that when someone has high motivation in the learning process, they will spend more time learning and experience an increase in their self-regulated learning abilities. In addition, previous research by Pintrich and De Groot and Schunk and Zimmerman (in Lubis & Dewi,

2022) found that individuals or learners with higher awareness and can control cognitive processes tend to achieve more successful learning outcomes.

It follows the results of research conducted by Maisaroh (2015) that self-regulated learning influences improving student learning outcomes. It significantly influences learning achievement (Fasahah & Fatimah, 2013; Hendrika, 2022). In addition, students who have good self-regulated learning skills can manage their learning process effectively and find solutions when facing academic challenges (Lubis & Dewi, 2022).

Students with a high self-confidence and good motivation (Holzer et al., 2021; Yoelianti & Toga, 2022), perform better academically (Richardson et al., 2012; Schneider & Preckel, 2017)(Liborius, Bellhauser, " & Schmitz, 2019) and have an easier time coping with the transition out of college (Park et al., 2012), assisting students in developing great interest in learning and has a positive impact on self-confidence in achieving goals (Xiao & Yang, 2019), and helps students realize their strengths and weaknesses so that they can connect time, resources, and mental effort towards learning goals (Li, 2019). Meanwhile, if students who have low self-regulated learning tend to have several problems, such as not being able to adapt or complete difficult tasks (Holzer et al., 2021; Yoelianti & Toga, 2022), the learning process feels directionless and has an impact on decreasing motivation learn (Widodo, 2021) and will tend to procrastinate (Steel, 2007). One of the goals of SRL children is autonomy learning.

Prayekti (2018) defines learning autonomy or learning independence as the nature, behavior, and abilities students possess to complete their learning activities, both independently and with the help of others. According to Maksum and Lestari (2020), learning independence is the ability to be responsible for self-regulating learning activities without depending on other people.

There are distinctive characteristics of individuals with learning independence, namely having freedom of opinion, confidence, responsibility, being able to make judgments when Rahmayani (2019) also characteristics of students with learning independence are self-confidence, initiative, responsibility, utilizing

various learning resources and implementing appropriate learning strategies (Berek et al., 2023). If students have high learning independence, they will try to complete all assignments given by the lecturer according to their potential (Berek et al., 2023). Vice versa, if students have low learning independence, the individual will depend on others (Berek et al., 2023).

These two variables are important because the ultimate goal is to make individuals have personal responsibility and the internalization of ethical behavior, they operationalize the construct through behavioral aspects, including class attendance, completing class assignments, and doing part of the work. Who are fair both inside and outside college and help others on a project.

The urgency of conducting this research is to discover the prevalence of personal responsibility, self-regulated learning and autonomy learning in students with increasingly growing science and technology development conditions. This research analyzed "Does personal responsibility have a significant relationship with self-regulated learning and autonomy learning?".

METODE PENELITIAN

This correlational study involved 141 college students with an age range of 18-25 years. These students are from semester 2 to semester 10, with 73% female and 27% male students. The determination of research sampling was carried out by stratified random sampling with an online data collection process. Students fill in 3 research instruments, namely the personal responsibility scale, the self-regulated learning scale and the autonomy learning scale. As for alternative answers with a Likert scale of 4-1 (very appropriate = 4; appropriate = 3, inappropriate = 2; very inappropriate = 1) for favorable items and the opposite.

HASIL DAN PEMBAHASAN

Based on research data, the following results of descriptive analysis conducted by researchers:

As many as 61% of students have high self-regulated learning, and 39% are in the medium category. It differs from student learning independence; most independent learning students are 108 or 76%, and only 33 students or 23.4%, are in the high category. As for personal responsibility, most students are moderate, and the

difference is slightly with the high category.

The table above is interpreted to mean that personal responsibility has a significant relationship with self-regulated learning and autonomy learning ($p > 0.000$).

involves students in social aspects with peers and other people with more knowledge. These efforts are made by optimizing student learning and emphasizing social skills such as cooperation, assertiveness, responsibility, empathy and self-control (Brock et al., 2008). Besides that, it can improve students' self-regulated learning abilities. As Blaschke Hase (2019) explained, self-regulated learning is a way for students to monitor the effective learning process and adapt to the learning approach taken, which consists of learning contexts and increasing abilities. Increasing students' self-regulated learning abilities will impact the development of autonomous learning abilities in students. As explained, learning autonomy or independence is the ability to be responsible and able to self-regulate learning activities, maximizing one's potential so that one does not depend on others (Maksum & Lestari, 2020; Inayah & Cahyani, 2023). so that if self-regulated learning and autonomous learning are attached to the individual, in the end, the individual will have personal responsibility in the learning process.

Al Ghamdi (2016) explains that the relevance of personal responsibility and general learning among successful students is demonstrated by actively ensuring that needs can be met and discontinued occasionally. In addition, Devici & Ayish (2017) suggest that personal responsibility can cause individuals to learn for life with the ability to overcome many existing challenges, specifically in developing deeper and meaningful learning so that opportunities can be obtained from time to time. It has been argued that research should consider whether young people have sufficient cognitive maturity to behave in

personally responsible ways and that developing a measure of personal responsibility that can discriminate between the cognitive abilities of young children, adolescents, and young adults would be beneficial and valuable. (Mergler, Spencer, and Patton 2007).

Inability to take responsibility, Zimmerman (2002) argues that many students still have not developed the ability to self-regulate. According to Zimmerman (2002), "Self-regulation refers to self-generated thoughts, feelings, and behaviors that are goal-oriented." The survey results show that educators think that many youth and adults, when entering university, lack a sense of personal responsibility for learning and are unaware of how the attitudes and behaviors displayed impact other learning. It has a negative impact or loss on several aspects, resulting in a low sense of responsibility in learning (Dallas & Hatanaka, 2016; Devici & Ayish, 2017).

Lovat et al. (2010) explained that there needs to be a process of empowering students to focus on responsibility in learning on their own; perceptions in the learning process grow so that the action is shown in the form of motivation in being involved during the learning process. Values integrated into the learning process can be used for deepening students' or teachers' reflection so that there is an interconnection between classroom

climates, a mutually supportive relationship between teachers and students and raises concern. Therefore, it is necessary to have an effective learning development design based on holistic development in various aspects of balanced development, such as intellectual, social, emotional, moral and spiritual.

The implications of this study's results are one of the bases for development, especially guidance and counseling services to integrate the heutagogy paradigm. The researcher answered the weakness of previous research that educators had not fully implemented the self-regulated factor. So, of course, integration into heutagogy is appropriate. Because one of the implications of heutagogy is self-regulated learning, this basic assumption is reinforced by Blaschke & Hase (2019), that self-regulated learning is a way for students to monitor the learning process that is effective and able to adapt to the learning approach taken, which consists of learning contexts and increasing abilities.

SIMPULAN

This study technological developments that are integrated into learning. The recommendation of this research for further studies is that a guidance model can be given to students in tertiary institutions which can support an increase in personal responsibility which is constructively appropriate, namely the heutagogy model. so that research on the development of development interventions can be carried out and also measurements of personal responsibility scales can be developed according to the needs of higher education settings.

Personal Responsibility Correlation in View of Self-Regulated Learning and Learning Autonomy University Students

Irvan Budhi Handaka, Agus Taufiq, Syamsu Yusuf, Diki Herdiansyah, Nany Glenda Tiskawa

Abstract

As explained, personal responsibility is an individual's skills in taking responsibility for all decisions and actions and the results and impacts on others. A sense of responsibility can affect student academic achievement, so having a sense of personal responsibility, especially in the learning process, becomes important. Personal or personal responsibility can be developed through self-regulated learning and learning autonomy. So, this study aims to determine whether there is a correlation between personal responsibility with self-regulated learning and learning autonomy. The method used in this study is quantitative with a correlational type of research involving 141 students from semester 2 to semester ten aged 18 to 24 years. The data collection technique uses three instruments (personal responsibility, self-regulated learning, and autonomy learning). This study's results indicate a correlation between the three variables, namely personal responsibility, self-regulated learning, and autonomy learning. The existence of this relationship shows that it is important for students to cultivate personal responsibility so that they can manage the learning process without depending on others (independently).
